`FETCh:NR:MODAcc:CARRier<x>:CCIGIM?`

Returns

<NRf>

Examples

`FETCh:NR:MODAcc:CARRier3:CCIGIM?` might return `0.001`, indicating component carrier 3 Composite Carrier IQ Gain Imbalance Mean is 0.001 dB.

FETCh:NR:MODAcc:CARRier<x>:CCIQEM? (Query Only)

Returns the Composite Carrier IQ Quadrature Error Mean of NR Constellation in NR Summary View Table. <x> is the component carrier. Range is 1 to 8.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:CCIQEM?`

Returns

<NRf>

Examples

`FETCh:NR:MODAcc:CARRier3:CCIQEM?` might return `19.3109996617E-3`, indicating component carrier 3 Composite Carrier IQ Quadrature Error Mean is 19.3109996617E-3.

FETCh:NR:MODAcc:CARRier<x>:IBEM? (Query Only)

Queries the In-Band Emission Range of the NR Constellation in NR Summary View Table. <x> is the component carrier. Range is 1 to 8.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:IBEM?`

Returns

<NRf>

Examples

`FETCh:NR:MODAcc:CARRier1:IBEM?` might return `9.9100E+37`, indicating the component carrier 1 In-Band Emission Range.

FETCh:NR:MODAcc:CARRier<x>:DATA:PEAK (Query Only)

Queries the SCH Data Peak **EVM** Maximum Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:DATA:PEAK?`

Returns

`<NRf>`

Examples

`FETCh:NR:MODAcc:CARRier1:DATA:PEAK?` might return `672.3846774548E-3`, indicating SCH Data Peak EVM Maximum Value is 0.672%.

FETCh:NR:MODAcc:CARRier<x>:DATA:RMS (Query Only)

Queries the SCH Data RMS **EVM** Mean Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:DATA:RMS?`

Returns

`<NRf>`

Examples

`FETCh:NR:MODAcc:CARRier1:DATA:RMS?` might return `286.3456029445E-3`, indicating SCH Data RMS EVM Mean Value is 0.286%.

FETCh:NR:MODAcc:CARRier<x>:DMRS:PEAK (Query Only)

Queries the SCH DMRS Peak **EVM** Maximum Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:DMRS:PEAK?`

Returns

`<NRf>`

Examples

`FETCh:NR:MODAcc:CARRier1:DMRS:PEAK?` might return `616.6561972350E-3`, indicating SCH DMRS Peak EVM Maximum Value is 0.617%.

FETCh:NR:MODAcc:CARRier<x>:DMRS:RMS (Query Only)

Queries the SCH DMRS **EVM** Mean Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:DMRS:RMS?`

Returns

`<NRf>`

Examples

`FETCh:NR:MODAcc:CARRier1:DMRS:RMS?` might return `251.3078739867E-3`, indicating SCH DMRS EVM Value is 0.251%.

FETCh:NR:MODAcc:CARRier<x>:PREM (Query Only)

Queries the Peak RMS EVM Maximum Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:PREM?`

Returns

<NRf>

Examples

`FETCh:NR:MODAcc:CARRier1:PREM?` might return `672.3846774548E-3`, indicating Peak EVM Maximum Value is 0.672%.

FETCh:NR:MODAcc:CARRier<x>:PTRS: RMS (Query Only)

Queries the SCH PTRS EVM Mean Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:MODAcc:CARRier<x>:PTRS:RMS?`

Returns

`<NRf>`

Examples

`FETCh:NR:MODAcc:CARRier1:PTRS:RMS?` might return `672.3846774548E-3`, indicating SCH PTRS EVM MEAN Value is 0.672%.

FETCh:NR:MODAcc:CARRier<x>:PTRS:PEAK (Query Only)

Queries the SCH PTRS Peak EVM Maximum Value of NR Constellation in NR Summary View Table display.

The parameter <x>=1 to 8, representing range of Component Carrier.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax
`FETCh:NR:MODAcc:CARRier<x>:PTRS:PEAK?`

Returns
`<NRf>`

Examples
`FETCh:NR:MODAcc:CARRier1:PTRS:PEAK?` might return `815.3068833053E-3`, indicating SCH PTRS Peak EVM Maximum.

FETCh:NR:OBW:ABSPower (Query Only)
Queries Absolute power of NR OBW display in NR Summary View Table display.

Conditions
Measurement view: NR Summary View Table measurement view

Group
Fetch commands

Syntax
`FETCh:NR:OBW:ABSPower`

Returns
<NRf>

Examples
`FETCh:NR:OBW:ABSPower?` might return `-13.8897142410 dBm`, indicating the Absolute power.

FETCh:NR:OBW:OCCUpiedbw (Query Only)
Queries Occupied Bandwidth of NR OBW display in NR Summary View Table display.

Conditions
Measurement view: NR Summary View Table measurement view

Group
Fetch commands

Syntax
`FETCh:NR:OBW:OCCUpiedbw`

Returns
`<NRf>`

Examples
`FETCh:NR:OBW:OCCUpiedbw?` might return `3.9506140488 MHz`, indicating the Occupied Bandwidth.

FETCh:NR:OBW:STARtfreq (Query Only)

Queries Start frequency of NR OBW display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:OBW:STARtfreq`

Returns

<NRf>

Examples

`FETCh:NR:OBW:STARtfreq?` might return `998.0183831384E+6`, indicating the Stop frequency.

FETCh:NR:OBW:STOPfreq (Query Only)

Queries Stop frequency of NR OBW display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:OBW:STOPfreq`

Returns

<NRf>

Examples

`FETCh:NR:OBW:STOPfreq?` might return `1.0019689972E+9`, indicating the Stop frequency.

FETCh:NR:PVT:ABS:OFFpower:AFTR (Query Only)

Queries Absolute Off Power After NR Power vs Time display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:PVT:ABS:OFFpower:AFTR`

Returns

<NRf>

Examples

FETCh:NR:PVT:ABS:OFFpower:AFTR? might return -62.4365692139 dBm, indicating the Absolute Off Power After.

FETCh:NR:PVT:ABS:OFFpower:BFR (Query Only)

Queries Absolute Off Power Before of NR Power vs Time display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

FETCh:NR:PVT:ABS:OFFpower:BFR

Returns

<NRf>

Examples

FETCh:NR:PVT:ABS:OFFpower:BFR? might return -62.4902038574 dBm, indicating the Absolute Off Power Before.

FETCh:NR:PVT:ABS:ONpower (Query Only)

Queries Absolute ON Power NR Power vs Time display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

FETCh:NR:PVT:ABS:ONpower

Returns

<NRf>

Examples

FETCh:NR:PVT:ABS:ONpower? might return -22.0409736633 dBm, indicating Absolute on power.

FETCh:NR:PVT:BURStwidth (Query Only)

Queries Burst Width NR Power vs Time display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:PVT:BURStwidth`

Returns

`<NRf>`

Examples

`FETCh:NR:PVT:BURStwidth?` might return `9.9988253091E-3 s`, indicating Burst Width.

FETCh:NR:PVT:MEASurement:STATus (Query Only)

Queries measurement status of NR Power vs Time display in NR Summary View Table display.

Conditions

Measurement view: NR Summary View Table measurement view

Group

Fetch commands

Syntax

`FETCh:NR:PVT:MEASurement:STATus`

Returns

`<NRf>`

Examples

`FETCh:NR:PVT:MEASurement:STATus?` might return `"PASS"`, indicating the Power vs Time passed.

FETCh:NR:SEM:TAGGpower? (Query Only)

Queries the Total Aggregate Power of the NR SEM in NR Summary View Table.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:TAGGpower?`

Returns

<NRf>

Examples

`FETCH:NR:SEM:TAGGPOWER?` might return -14.0847625732 dBm, indicating the Total Aggregate Power.

FETCh:NR:SEM:OFFSet<x>:STARtfreq? (Query Only)

Queries the Start Frequency of the specified offset of the NR SEM display in NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:STARtfreq?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet5:STARtfreq?` might return -25.0000000000E+3 Hz, indicating the Start Frequency of offset 5.

FETCh:NR:SEM:OFFSet<x>:STOPfreq? (Query Only)

Queries the Stop Frequency of the specified offset of the NR SEM display in NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:STOPfreq?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet10:STOPtfreq?` might return `-975.0000000000E+3 Hz`, indicating the Stop Frequency of offset 10.

FETCh:NR:SEM:OFFSet<x>:PEAK:ABS? (Query Only)

Queries the peak absolute value of specified offset of NR SEM display in NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:PEAK:ABS?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet1:PEAK:ABS?` might return `-65.5201115608 dBm`, indicating the Peak Absolute value of offset 1.

FETCh:NR:SEM:OFFSet<x>:PEAK:REL? (Query Only)

Queries the peak relative value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:PEAK:REL?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet1:PEAK:REL?` might return -51.4353489876 dB, indicating the Peak Relative of offset 1.

FETCh:NR:SEM:OFFSet<x>:PEAK:FREQ? (Query Only)

Queries the peak frequency of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:PEAK:FREQ?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet1:PEAK:FREQ?` might return `997.4753714650E+6 GHz`, indicating the Peak Frequency of offset 1.

FETCh:NR:SEM:OFFSet<x>:MARGin? (Query Only)

Queries the margin of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:MARGin?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet3:MARGin?` might return `-52.5201110840 dB`, indicating the Margin of offset 3.

FETCh:NR:SEM:OFFSet<x>:MARGin:ABS? (Query Only)

Queries the margin absolute value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:MARGin:ABS?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet2:MARGin:ABS?` might return `-51.4353489876 dBm`, indicating the Margin Absolute value of offset 2.

FETCh:NR:SEM:OFFSet<x>:MARGin:REL? (Query Only)

Queries the margin relative value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:MARGin:REL?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet1:MARGin:REL?` might return `-51.4353489876 dB`, indicating the Margin Relative value of offset 1.

FETCh:NR:SEM:OFFSet<x>:MARGin:FREQ? (Query Only)

Queries the margin frequency of the specified offset of the NR SEM display in the NR Summary View Table <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:MARGin:FREQ?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet1:MARGin:FREQ?` might return `-51.4353489876 GHz`, indicating the margin frequency of offset 1.

FETCh:NR:SEM:OFFSet<x>:INTEg:ABS? (Query Only)

Queries the Integ Absolute value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:INTEg:ABS?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet3:INTEg:ABS?` might return `-51.4353489876 dBm`, indicating the Integ Absolute value of offset 3.

FETCh:NR:SEM:OFFSet<x>:INTEg:REL? (Query Only)

Queries the Integ Relative value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:INTEg:REL?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet2:INTEg:REL?` might return `-51.4353489876 dB`, indicating the Integ Relative value of offset 2.

FETCh:NR:SEM:OFFSet<x>:RBW? (Query Only)

Queries the RBW of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:RBW?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet1:RBW?` might return `-51.4353489876 kHz`, indicating the RBW of offset 1.

FETCh:NR:SEM:OFFSet<x>:ABSLimit:STARt? (Query Only)

Queries the Absolute Start value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:ABSLimit:STARt?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet2:ABSLimit:STARt?` might return `-51.4353489876 dBm`, indicating the Absolute Start of offset 2.

FETCh:NR:SEM:OFFSet<x>:ABSLimit:STOP? (Query Only)

Queries the Absolute Stop value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:ABSLimit:STOP?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet2:ABSLimit:STARt?` might return `-51.4353489876 dBm`, indicating the Absolute Stop value of offset 2.

FETCh:NR:SEM:OFFSet<x>:RELLimit:STARt? (Query Only)

Queries the Relative Start value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:RELLimit:STARt?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet2:RELLimit:STARt?` might return `-51.4353489876 dBm`, indicating the Relative Start value of offset 2.

FETCh:NR:SEM:OFFSet<x>:RELLimit:STOP? (Query Only)

Queries the Relative Stop value of the specified offset of the NR SEM display in the NR Summary View Table. <x> is the offset. Range is 1 to 16.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SEM:OFFSet<x>:RELLimit:STOP?`

Returns

<NRf>

Examples

`FETCh:NR:SEM:OFFSet2:RELLimit:STOP?` might return `-51.4353489876 dBm`, indicating the Relative Stop value of offset 2.

FETCh:NR:SUBblock<x>:NUMCcs? (Query Only)

Queries the number of component carriers in the specified subblock of the NR Constellation in the NR Summary View Table. <x> is the subblock. Range is 1.

Conditions

Measurement view: NR Summary View Table

Group

Fetch commands

Syntax

`FETCh:NR:SUBblock<x>:NUMCcs?`

Returns

<NRf>

Examples

`FETCh:NR:SUBblock1:NUMCcs?` might return `8`, indicating that the number of component carriers in subblock 1 is 8.

FETCh:OBWidth:BOBW:FREQuency:ERRor (Query Only)

Returns the frequency error in the Bluetooth 20dB BW display.

Conditions

Measurement view: Bluetooth 20dB BW

Group

Fetch commands

Syntax
`FETCh:OBWidth:BOBW:FREQuency:ERRor?`

Arguments
None

Returns
<NRf>

Examples
`FETCH:OBWIDTH:BOBW:FREQUENCY:ERROR` might return `-999.1 kHz`, indicating the frequency error is `-999.1 kHz`.

FETCh:OBWidth:BOBW:RESUlts:STATus (Query Only)
Returns the test result as Pass or Fail in the Bluetooth 20dB BW display.

Conditions
Measurement views: Bluetooth 20dB BW

Group
Fetch commands

Syntax
`FETCh:OBWidth:BOBW:RESUlts:STATus`

Arguments
None

Returns
`PASS` means the test passed.

`FAIL` means the test failed.

`INVALID` means there was an error and the test did not complete.

Examples
`FETCH:OBWIDTH:BOBW:RESULTS:STATUS` might return `Pass` or `Fail` or `Invalid` for Bluetooth 20dB BW display.

FETCh:OBWidth:BOBW:XDBB:POWer (Query Only)
Returns the x dB BW Ref Power value for the selected bandwidth as shown in the Bluetooth 20dB BW display.

Conditions
Measurement view: Bluetooth 20dB BW

Group
Fetch commands

Syntax
`FETCh:OBWidth:BOBW:XDBB:POWer?`

Returns

<NR3>

Examples

`FETCH:OBWIDTH:BOBW:XDBB:POWER` might return `-9.0197525024`, indicating that the x dB reference power for the selected bandwidth is -9.0197525024 dB.

FETCh:OBWidth:BOBW:XDBBandwidth? (Query Only)

Returns the difference between the higher and lower frequency points corresponding to the value where it is X dB less from the value at the center frequency.

Set the measurement direction using the appropriate inward or outward command before issuing this command.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

`FETCh:OBWidth:BOBW:XDBBandwidth?`

Related Commands

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth? (on page 1270)

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth? (on page 1272)

Arguments

None

Returns

<value> ::= <NRf> the X dBm bandwidth in Hz.

Examples

`FETCH:OBWIDTH:BOBW:XDBBANDWIDTH?` might return `89.12000E+3`, indicating the difference between the higher and lower frequency points is 89.12 kHz.

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth? (Query Only)

Returns the difference between the higher and lower frequency points corresponding to the value which it is the X dBm value measured inwards (coming from the ends to the center frequency).

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth?

Related Commands

FETCh:OBWidth:BOBW:XDBBandwidth? (on page 1270)

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth? (on page 1272)

Arguments

None

Returns

<value> ::= <NRf> the input X dBm value in Hz.

Examples

FETCH:OBWIDTH:BOBW:XDBMBANDWIDTH:IN:BANDWIDTH? might return 1.2518400000E+6, indicating that the bandwidth corresponding to the input XdBm vaue is 1.2518 MHz measured in the inward direction.

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:LEFT:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the left of the center frequency measured in the inward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:LEFT:FREQuency?

Related Commands

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency? (on page 1271)

Arguments

None

Returns

<value> ::= <NRf> the left frequency in Hz.

Examples

FETCH:OBWIDTH:BOBW:XDBMBANDWIDTH:IN:LEFT:FREQUENCY? might return 2.401E+9 indicating that the frequency corresponding to the X dbm value to the left of the center frequency is 2.401 GHz.

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the right of the center frequency measured in the inward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

```
FETCh:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency?
```

Related Commands

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:LEFT:FREQuency? (on page 1271)

Arguments

None

Returns

<value> ::= <NRf> the right frequency in Hz.

Examples

`FETCH:OBWIDTH:BOBW:XDBMBANDWIDTH:IN:RIGHT:FREQUENCY?` might return `2.445E+9`, indicating that the frequency corresponding to the XdBm value to the right of the center the frequency is 2.445 GHz.

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth? (Query Only)

Returns the difference between the higher and lower frequency points corresponding to the value which it is the X dBm value measured outwards (from the center frequency to the ends).

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

```
FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth?
```

Related Commands

FETCh:OBWidth:BOBW:XDBBandwidth? (on page 1270)

FETCh:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth? (on page 1270)

Arguments

None

Returns

<value> ::= <NRf> the input X dBm value in Hz.

Examples

FETCH:OBWIDTH:BOBW:XDBMBANDWIDTH:OUT:BANDWIDTH? might return 1.2518400000E+6, indicating that the bandwidth corresponding to the output XdBm vaue is 1.2518 MHz measured in the outward direction.

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:LEFT:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the left of the center frequency measured in the outward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:LEFT:FREQuency?

Related Commands

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:RIGHt:FREQuency? (on page 1273)

Arguments

None

Returns

<value> ::= <NRf> the left frequency in Hz.

Examples

FETCH:OBWIDTH:BOBW:XDBMBANDWIDTH:OUT:LEFT:FREQUENCY? might return 2.401E+9, indicating that the frequency corresponding to the X dbm value to the left of the center frequency is 2.401 GHz..

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:RIGHt:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the right of the center frequency measured in the outward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Fetch commands

Syntax

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:RIGHt:FREQuency?

Related Commands

FETCh:OBWidth:BOBW:XDBMbandwidth:OUT:LEFT:FREQuency? (on page 1273)

Arguments

None

Returns

<value> ::= <NRf> the Right frequency in Hz.

Examples

`FETCH:OBWIDTH:BOBW:XDBMBANDWIDTH:OUT:RIGHT:FREQUENCY?` might return `2.445E+9`, indicating that the frequency corresponding to the XdBm value to the right of the center the frequency is 2.445 GHz.

FETCh:OBWidth:FREQuency:ERRor? (Query Only)

Returns the frequency error in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:FREQuency:ERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`FETCH:OBWIDTH:FREQUENCY:ERROR?` might return `-10.7E+3`, indicating the frequency error is -10.7 kHz.

FETCh:OBWidth:OBWidth:BANDwidth? (Query Only)

Returns the occupied bandwidth in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:OBWidth:BANDwidth?`

Arguments

None

Returns

`<OBW>::<NRf>` is the occupied bandwidth in Hz.

Examples

`FETCH:OBWIDTH:OBWIDTH:BANDWIDTH?` might return `4.0E+6`, indicating the occupied bandwidth is 4 MHz.

FETCh:OBWidth:OBWidth:LEFT:FREQuency? (Query Only)

Returns the left (lower) frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:OBWidth:LEFT:FREQuency?`

Related Commands

FETCh:OBWidth:OBWidth:RIGHt:FREQuency? (on page 1276)

Arguments

None

Returns

`<OBW_left_freq>::<NRf>` is the left frequency in Hz.

Examples

`FETCH:OBWIDTH:OBWIDTH:LEFT:FREQUENCY?` might return `1.498E+9`, indicating the left frequency is 1.498 GHz.

FETCh:OBWidth:OBWidth:LEFT:LEVel? (Query Only)

Returns the level at the left frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:OBWidth:LEFT:LEVel?`

Related Commands

FETCh:OBWidth:OBWidth:RIGHt:LEVel? (on page 1277)

Arguments

None

Returns

`<OBW_left_level>::<NRf>` is the level at the left frequency in dB.

Examples

`FETCH:OBWIDTH:OBWIDTH:LEFT:LEVEL?` might return `-23.5`, indicating the level at the left frequency is -23.5 dB.

FETCh:OBWidth:OBWidth:POWer? (Query Only)

Returns the reference power in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:OBWidth:POWer?`

Arguments

None

Returns

`<OBW_ref_power>::<NRf>` is the reference power in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:OBWIDTH:OBWIDTH:POWER?` might return `-10.0`, indicating the reference power is -10 dBm.

FETCh:OBWidth:OBWidth:RIGHt:FREQuency? (Query Only)

Returns the right (higher) frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:OBWidth:RIGHt:FREQuency?`

Related Commands

FETCh:OBWidth:OBWidth:LEFT:FREQuency? (on page 1275)

Arguments

None

Returns

`<OBW_right_freq>::<NRf>` is the right frequency in Hz.

Examples

FETCH:OBWIDTH:OBWIDTH:RIGHT:FREQUENCY? might return 1.502E+9, indicating the right frequency is 1.502 GHz.

FETCh:OBWidth:OBWidth:RIGHt:LEVel? (Query Only)

Returns the level at the right frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

FETCh:OBWidth:OBWidth:RIGHt:LEVel?

Related Commands

FETCh:OBWidth:OBWidth:LEFT:LEVel? (on page 1275)

Arguments

None

Returns

<OBW_right_level>::<NRf> is the level at the right frequency in dB.

Examples

FETCH:OBWIDTH:OBWIDTH:RIGHT:LEVEL? might return -23.5, indicating the level at the right frequency is -23.5 dB.

FETCh:OBWidth:SPECtrum? (Query Only)

Returns spectrum trace data of the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

FETCh:OBWidth:SPECtrum?

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the amplitude in dBm at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

FETCH:OBWIDTH:SPECTRUM? might return #43204xxxx... (3204-byte data) for the spectrum trace data of the Occupied Bandwidth measurement.

FETCh:OBWidth:XDBBandwidth:BANDwidth? (Query Only)

Returns the x dB bandwidth in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

FETCh:OBWidth:XDBBandwidth:BANDwidth?

Arguments

None

Returns

<xdBBW>::<NRf> is the x dB bandwidth in Hz.

Examples

FETCH:OBWIDTH:XDBBANDWIDTH:BANDWIDTH? might return 2.0E+6, indicating the x dB bandwidth is 2 MHz.

FETCh:OBWidth:XDBBandwidth:LEFT:FREQuency? (Query Only)

Returns the left (lower) frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

FETCh:OBWidth:XDBBandwidth:LEFT:FREQuency?

Related Commands

FETCh:OBWidth:XDBBandwidth:RIGHt:FREQuency? (on page 1280)

Arguments

None

Returns

<xdBBW_left_freq>::<NRf> is the left frequency in Hz.

Examples

`FETCH:OBWIDTH:XDBBANDWIDTH:LEFT:FREQUENCY?` might return `1.498E+9`, indicating the left frequency is 1.498 GHz.

FETCh:OBWidth:XDBBandwidth:LEFT:LEVel? (Query Only)

Returns the level at the left frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:XDBBandwidth:LEFT:LEVel?`

Related Commands

FETCh:OBWidth:XDBBandwidth:RIGHt:LEVel? (on page 1280)

Arguments

None

Returns

`<xdBBW_left_level>::<NRf>` is the level at the left frequency in dB.

Examples

`FETCH:OBWIDTH:XDBBANDWIDTH:LEFT:LEVEL?` might return `-23.5`, indicating the level at the left frequency is -23.5 dB.

FETCh:OBWidth:XDBBandwidth:POWer? (Query Only)

Returns the reference power in the x dB bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:XDBBandwidth:POWer?`

Arguments

None

Returns

`<xdBBW_ref_power>::<NRf>` is the reference power in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:OBWIDTH:XDBBANDWIDTH:POWER?` might return `-10.0`, indicating the reference power is -10 dBm.

FETCh:OBWidth:XDBBandwidth:RIGHt:FREQuency? (Query Only)

Returns the right (higher) frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:XDBBandwidth:RIGHt:FREQuency?`

Related Commands

FETCh:OBWidth:XDBBandwidth:LEFT:FREQuency? (on page 1278)

Arguments

None

Returns

`<xdBBW_right_freq>::<NRf>` is the right frequency in Hz.

Examples

`FETCH:OBWIDTH:XDBBANDWIDTH:RIGHT:FREQUENCY?` might return `1.502E+9`, indicating the right frequency is 1.502 GHz.

FETCh:OBWidth:XDBBandwidth:RIGHt:LEVel? (Query Only)

Returns the level at the right frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Fetch commands

Syntax

`FETCh:OBWidth:XDBBandwidth:RIGHt:LEVel?`

Related Commands

FETCh:OBWidth:XDBBandwidth:LEFT:LEVel? (on page 1279)

Arguments

None

Returns

<xdBBW_right_level>::<NRf> is the level at the right frequency in dB.

Examples

FETCH:OBWIDTH:XDBBANDWIDTH:RIGHT:LEVEL? might return -23.5, indicating the level at the right frequency is -23.5 dB.

FETCh:OFDM:APOWer? (Query Only)

Returns the average power in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:APOWer?

Arguments

None

Returns

<apower>::<NRf> the average power in dB.

Examples

FETCH:OFDM:APOWER? might return -23.4584459235, indicating the average power is –23.46 dB.

FETCh:OFDM:APOWer:PEAK? (Query Only)

Returns the peak-to-average power in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:APOWer:PEAK?

Arguments

None

Returns

<apower_peak>::<NRf> is the peak-to-average power in dBm.

Examples

FETCH:OFDM:APOWER:PEAK? might return 10.4140096289, indicating that peak-to-average power is 10.41 dBm.

FETCh:OFDM:CONSte:MAGNitude? (Query Only)

Returns the constellation magnitude data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:CONSte:MAGNitude?`

Related Commands

FETCh:OFDM:CONSte:PHASe? (on page 1282)

FETCh:OFDM:CONSte:TYPE? (on page 1283)

FETCh:OFDM:CONSte:VALue? (on page 1284)

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:OFDM:CONSTE:MAGNITUDE?` might return `#510400xxxx...` (10400-byte data) for the measurement.

FETCh:OFDM:CONSte:PHASe? (Query Only)

Returns the constellation phase values of the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:CONSte:PHASe?`

Related Commands

FETCh:OFDM:CONSte:MAGNitude? (on page 1282)

FETCh:OFDM:CONSte:TYPE? (on page 1283)

FETCh:OFDM:CONSte:VALue? (on page 1284)

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:OFDM:CONSTE:PHASE? might return #510400xxxx... (10400-byte data) for the measurement.

FETCh:OFDM:CONSte:TYPE? (Query Only)

Returns the constellation context value of the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:CONSte:TYPE?

Related Commands

FETCh:OFDM:CONSte:MAGNitude? (on page 1282)

FETCh:OFDM:CONSte:PHASe? (on page 1282)

FETCh:OFDM:CONSte:VALue? (on page 1284)

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in 16-bit little endian integers. The integers must be translated to the proper context as listed below.

Integer value	Type (context)
0	Pilot

Integer value	Type (context)
1	Data
2	Unused or Null

Examples

`FETCH:OFDM:CONSTE:TYPE?` might return `#41352` (1352-byte data) for the measurement. The actual data must be decoded to the context type using the table above.

FETCh:OFDM:CONSte:VALue? (Query Only)

Returns the constellation value (decoded symbol) of the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:CONSte:VALue?`

Related Commands

FETCh:OFDM:CONSte:MAGNitude? (on page 1282)

FETCh:OFDM:CONSte:PHASe? (on page 1282)

FETCh:OFDM:CONSte:TYPE? (on page 1283)

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in 16-bit little endian integers.

Examples

`FETCH:OFDM:CONSTE:VALUE?` might return `#41352` indicating 1352 bytes of data for the measurement.

FETCh:OFDM:CPE? (Query Only)

Returns the Common Pilot Error magnitude for the OFDM measurement

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:CPE?`

Arguments

None

Returns

`<NRf>` the RMS magnitude error in percent.

Examples

`FETCH:OFDM:CPE?` might return `3.7868041505`, indicating that the CPE is 3.787%.

FETCh:OFDM:CRESponse:MAGNitude? (Query Only)

Returns the channel response magnitude data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:CRESponse:MAGNitude?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:OFDM:CRESPONSE:MAGNITUDE?` might return `#3804xxxx. . .` (804 byte data) for the measurement.

FETCh:OFDM:CRESponse:PHASe? (Query Only)

Returns the channel response phase data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:CRESponse:PHASe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:OFDM:CRESPONSE:PHASE?` might return `#3804xxxx. . .` (804 byte data) for the measurement.

FETCh:OFDM:EVM:PEAK:DECibel:ALL? (Query Only)

Returns the peak EVM data for all subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:DECibel:ALL?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`FETCH:OFDM:EVM:PEAK:DECIBEL:ALL?` might return `-20.1872549032`, indicating the data is –20.19 dB for the measurement.

FETCh:OFDM:EVM:PEAK:DECibel:DATA? (Query Only)

Returns the peak EVM data for the data subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:DECibel:DATA?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`FETCH:OFDM:EVM:PEAK:DECIBEL:DATA?` might return `-20.1872549032` indicating the data is –20.19 dB for the measurement.

FETCh:OFDM:EVM:PEAK:DECibel:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:DECibel:PILots?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`FETCH:OFDM:EVM:PEAK:DECIBEL:PILOTS?` might return `-20.2872549032`, indicating the data is –20.29 dB for the measurement.

FETCh:OFDM:EVM:PEAK:PERCent:ALL? (Query Only)

Returns the peak EVM data for all subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax
`FETCh:OFDM:EVM:PEAK:PERCent:ALL?`

Arguments
None

Returns
`<NRf>` data in percent.

Examples
`FETCH:OFDM:EVM:PEAK:PERCENT:ALL?` might return `19.3223863840`, indicating the data is 19.322% for the measurement.

FETCh:OFDM:EVM:PEAK:PERCent:DATA? (Query Only)
Returns the peak EVM data for the data subcarriers in the OFDM measurement as a percent.

Conditions
Measurement views: OFDM

Group
Fetch commands

Syntax
`FETCh:OFDM:EVM:PEAK:PERCent:DATA?`

Arguments
None

Returns
`<NRf>` data in percent.

Examples
`FETCH:OFDM:EVM:PEAK:PERCENT:DATA?` might return `19.3223863840`, indicating the data is 19.322% for the measurement.

FETCh:OFDM:EVM:PEAK:PERCent:PILots? (Query Only)
Returns the peak EVM data for the pilot subcarriers in the OFDM measurement as a percent.

Conditions
Measurement views: OFDM

Group
Fetch commands

Syntax
`FETCh:OFDM:EVM:PEAK:PERCent:PILots?`

Arguments

None

Returns

<NRf> data in percent.

Examples

FETCH:OFDM:EVM:PEAK:PERCENT:PILOTS? might return 10.8543863840, indicating the data is 10.854% for the measurement.

FETCh:OFDM:EVM:PEAK:SCARrier:ALL? (Query Only)

Returns the peak EVM data for all subcarriers at the subcarrier level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:EVM:PEAK:SCARrier:ALL?

Arguments

None

Returns

<NR1>

Examples

FETCH:OFDM:EVM:PEAK:SCARRIER:ALL? might return 99.00000, indicating the data is 99 for the measurement.

FETCh:OFDM:EVM:PEAK:SCARrier:DATA? (Query Only)

Returns the peak EVM data for all data subcarriers at the subcarrier level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:EVM:PEAK:SCARrier:DATA?

Arguments

None

Returns

<NR1>

Examples

`FETCH:OFDM:EVM:PEAK:SCARRIER:DATA?` might return `99.00000`, indicating the data is 99 for the measurement.

FETCh:OFDM:EVM:PEAK:SCARrier:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers at the subxcarrier level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:SCARrier:PILots?`

Arguments

None

Returns

<NR1>

Examples

`FETCH:OFDM:EVM:PEAK:SCARRIER:PILOTS?` might return `88.00000`, indicating the data is 88 for the measurement

FETCh:OFDM:EVM:PEAK:SYMBol:ALL? (Query Only)

Returns the peak EVM data for all subcarriers at the symbol level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:SYMBol:ALL?`

Arguments

None

Returns

<NR1>

Examples

`FETCH:OFDM:EVM:PEAK:SYMBOL:ALL?` might return 2.00000 indicating the data is 2 for the measurement.

FETCh:OFDM:EVM:PEAK:SYMBol:DATA? (Query Only)

Returns the peak EVM data for the data subcarriers at the symbol level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:SYMBol:DATA?`

Arguments

None

Returns

<NR1>

Examples

`FETCH:OFDM:EVM:PEAK:SYMBOL:DATA?` might return `2.00000`, indicating the data is 2 for the measurement.

FETCh:OFDM:EVM:PEAK:SYMBol:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers at the symbol level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:PEAK:SYMBol:PILots?`

Arguments

None

Returns

<NR1>

Examples

`FETCH:OFDM:EVM:PEAK:SYMBOL:PILOTS?` might return `1.00000`, indicating the data is `1` for the measurement.

FETCh:OFDM:EVM:RMS:DECibel:ALL? (Query Only)

Returns the RMS EVM data for all subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax
`FETCh:OFDM:EVM:RMS:DECibel:ALL?`

Arguments
None

Returns
<NRf> data in dB.

Examples
`FETCH:OFDM:EVM:RMS:DECIBEL:ALL?` might return `-26.9012093267`, indicating the data is –26.90 for the measurement.

FETCh:OFDM:EVM:RMS:DECibel:DATA? (Query Only)
Returns the RMS EVM data for the data subcarriers in the OFDM measurement.

Conditions
Measurement views: OFDM

Group
Fetch commands

Syntax
`FETCh:OFDM:EVM:RMS:DECibel:DATA?`

Arguments
None

Returns
<NRf> data in dB.

Examples
`FETCH:OFDM:EVM:RMS:DECIBEL:DATA?` might return `-26.8477116269`, indicating the data is –26.85 for the measurement.

FETCh:OFDM:EVM:RMS:DECibel:PILots? (Query Only)
Returns the RMS EVM data for the pilot subcarriers in the OFDM measurement.

Conditions
Measurement views: OFDM

Group
Fetch commands

Syntax
`FETCh:OFDM:EVM:RMS:DECibel:PILots?`

Arguments

None

Returns

<NRf> data in dB.

Examples

`FETCH:OFDM:EVM:RMS:DECIBEL:PILOTS?` might return `-33.0589143032`, indicating the data is –33.06 dB.

FETCh:OFDM:EVM:RMS:PERCent:ALL? (Query Only)

Returns the peak RMS data for all subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:RMS:PERCent:ALL?`

Arguments

None

Returns

<NRf> data in percent.

Examples

`FETCH:OFDM:EVM:RMS:PERCENT:ALL?` might return `225.0743627548`, indicating the data is 225.074% for the measurement.

FETCh:OFDM:EVM:RMS:PERCent:DATA? (Query Only)

Returns the peak RMS data for the data subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:RMS:PERCent:DATA?`

Arguments

None

Returns

<NRf> data in percent.

Examples

`FETCH:OFDM:EVM:RMS:PERCENT:DATA?` might return `260.6973409653`, indicating that the data is 260.697% for the measurement.

FETCh:OFDM:EVM:RMS:PERCent:PILots? (Query Only)

Returns the peak RMS data for the pilot subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:RMS:PERCent:PILots?`

Arguments

None

Returns

<NRf> data in percent.

Examples

`FETCH:OFDM:EVM:RMS:PERCENT:PILOTS?` might return `210.8103863840`, indicating the data is 210.810% for the measurement.

FETCh:OFDM:EVM:TRACe<x>? (Query Only)

Returns the EVM trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:EVM:TRACe<x>?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:OFDM:EVM:TRACE2? might return #252xxxx. . . (52 byte data) for the Average versus Symbols measurement.

FETCh:OFDM:FERRor? (Query Only)

Returns the Frequency error reading for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:FERRor?

Arguments

None

Returns

<NRf> frequency error.

Examples

FETCH:OFDM:FERROR? might return 82.8617142098E+3, indicating the frequency error was 82.86 kHz.

FETCh:OFDM:FLATness:PASS? (Query Only)

Queries whether the average power levels of subcarriers across the signal bandwidth on the OFDM Spectral Flatness display remain within the limits defined for a particular standard.

Conditions

Measurement view: OFDM

This command requires Option 22, "OFDM Measurements".

Group

Fetch commands

Syntax

FETCh:OFDM:FLATness:PASS?

Returns

Returns "1" in the case that all data remains within the defined limits, and "0" otherwise.

Examples

`FETCH:OFDM:FLAT:PASS?` might return 1, which means that the average power levels of subcarriers across the signal bandwidth remain within the defined limits.

FETCh:OFDM:FLATness:RESult? (Query Only)

Returns the summary results of each segment of the OFDM Spectral Flatness display.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Fetch commands

Syntax

`FETCh:OFDM:FLATness:RESult?`

Returns

The data is returned as 12 comma delineated text values. The specific values are :

- minimum subcarrier within segment 1
- minimum subcarrier average energy deviation from the global average within segment 1
- deviation the of minimum subcarrier average from the allowed value in segment 1
- maximum subcarrier within segment 1
- maximum subcarrier average energy deviation from the global average within segment 1
- deviation of the maximum subcarrier average from the allowed value in segment 1
- minimum subcarrier within segment 2
- minimum subcarrier average energy deviation from the global average within segment 2
- deviation the of minimum subcarrier average from the allowed value in segment 2
- maximum subcarrier within segment 2
- maximum subcarrier average energy deviation from the global average within segment 2
- deviation of the maximum subcarrier average from the allowed value in segment 2

Examples

`FETCH:OFDM:FLAT:RES?` might return `-6.0000000000,-17.0626174659E-3,3.9829373825,12.0000000000,19.979260861` which represents the summary results of each segment of the OFDM Spectral Flatness display.

FETCh:OFDM:FLATness:TRACe<x>? (Query Only)

Returns the OFDM Spectral Flatness trace data. When <x> is 1, the parameter is Matrix (symbol deviation per subcarrier). When<x> is 2, the parameter is Average Deviation vs Subcarrier.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Fetch commands

Syntax

`FETCh:OFDM:FLATness:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:OFDM:FLAT:TRACE2?` might return `#510400..` (10400-byte data) which represents the data for the Average Deviation vs. Subcarrier trace.

FETCh:OFDM:GAIN:IMBalance? (Query Only)

Returns the gain imbalance for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:GAIN:IMBalance?`

Arguments

None

Returns

<NRf> gain imbalance in dB.

Examples

`FETCH:OFDM:GAIN:IMBALANCE?` might return `-57.746E-3`, indicating that the gain imbalance is −0.057746 dB.

FETCh:OFDM:IQ:ORIGin:OFFSet? (Query Only)

Returns the IQ origin offset for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:IQ:ORIGin:OFFSet?`

Arguments

None

Returns

<NRf> gain imbalance in dB.

Examples

`FETCH:OFDM:IQ:ORIGIN:OFFSET?` might return `-53.47017` indicating that the IQ origin offset is −53.47 dB.

FETCh:OFDM:MERRor:TRACe<x>? (Query Only)

Returns the magnitude error trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:MERRor:TRACe<x>?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:OFDM:MERROR:TRACE2` might return `#3108xxxx. . .` (108-byte data) for the average versus symbols trace measurement.

FETCh:OFDM:PACKet:DIRection? (Query Only)

Returns the direction of the packet in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:PACKet:DIRection?`

Arguments

None

Returns

One of the following values.

`UP` specifies that the packet is in the up direction.

`DOWN` specifies that the packet is in the down direction.

`BOTH` specifies that the packet is both directions.

Examples

`FETCH:OFDM:PACKET:DIRECTION?` might return `DOWN`, indicating that the packet was in the down direction.

FETCh:OFDM:PERRor:TRACe<x>? (Query Only)

Returns the phase error trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:PERRor:TRACe<x>?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:OFDM:PERROR:TRACE2 might return #3100xxxx. . . (100-byte data) for the average versus symbols trace measurement.

FETCh:OFDM:POWer:TRACe<x>? (Query Only)

Returns the power trace data for the OFDM measurement. When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols. When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:POWer:TRACe<x>?

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:OFDM:POWER:TRACE2 might return #296xxxx. . . (96-byte data) for the average versus symbols trace measurement.

FETCh:OFDM:QUADrature:OFFSet? (Query Only)

Returns the quadrature offset in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

FETCh:OFDM:QUADrature:OFFSet?

Arguments

None

Returns

<NRf> quadrature offset in degrees.

Examples

`FETCH:OFDM:QUADRATURE:OFFSET?` might return `-99.9`, indicating that the offset is −99°.

FETCh:OFDM:SCARriers? (Query Only)

Returns the number of subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:SCARriers?`

Arguments

None

Returns

<NR1> number of subcarriers.

Examples

`FETCH:OFDM:SCARRIERS?` might return `200.0000`, indicating that there are 200 subcarriers in the measurement.

FETCh:OFDM:SCARriers:SPACing? (Query Only)

Returns the subcarrier spacing for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:SCARriers:SPACing?`

Arguments

None

Returns

<NRf> subcarrier spacing.

Examples

`FETCH:OFDM:SCARRIERS:SPACING?` might return `90.000E+3`, indicating that the subcarrier spacing is 90.000 kHz.

FETCh:OFDM:STABle:VALUe? (Query Only)

Returns the number of bytes in the symbol table for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:STABle:VALUe?`

Arguments

None

Returns

`#<num_digit><num_byte>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

Examples

`FETCH:OFDM:STABLE:VALUE?` might return `#43848` indicating that there are 3848 bytes in the symbol table.

FETCh:OFDM:SYMBol:CERRor? (Query Only)

Returns the symbol clock error for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:SYMBol:CERRor?`

Arguments

None

Returns

<NRf> symbol clock error in ppm.

Examples

`FETCH:OFDM:SYMBOL:CERROR?` might return `422.7135479929`, indicating that the symbol clock error was 422.714 ppm.

FETCh:OFDM:SYMBol:COUNt? (Query Only)

Returns the number of symbols for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Fetch commands

Syntax

`FETCh:OFDM:SYMBol:COUNt?`

Arguments

None

Returns

<NR1> number of symbols in the measurement.

Examples

`FETCH:OFDM:SYMBOL:COUNT?` might return `25.00000`, indicating that there were 25 symbols for the measurement.

FETCh:P25:CONSte:FERRor? (Query Only)

Returns the frequency error in Hz. The frequency error is the difference between the measured carrier frequency of the signal and the user-selected center frequency of the analyzer.

When Frequency Error is in Auto mode, this query returns the frequency error value. When in Manual mode, it returns the frequency offset.

Conditions

Measurement view: P25 Constellation

Group

Fetch commands

Syntax

FETCh:P25:CONSte:FERRor?

Returns

<freq_error>::<NRf>, which is the frequency error in Hz.

Examples

`FETCH:P25:CONSTE:FERROR?` might return `-10.7E+3`, which is a frequency error of -10.7 kHz.

FETCh:P25:CONSte:TRACe? (Query Only)

Returns the P25 Constellation display trace data.

Conditions

Measurement view: P25 Constellation

Group

Fetch commands

Syntax

`FETCh:P25:CONSte:TRACe?`

Returns

`#<num_digit><num_byte><I(1)><Q(1)><I(2)><Q(2)>...<I(n)><Q(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<I(n)>` and `<Q(n)>` are the normalized I- and Q- coordinate values at the *n*th data point. 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`FETCH:P25:CONSTE:TRACE?` might return `#43848xxxx...` (3848-byte data) for the P25 Constellation trace data.

FETCh:P25:EDIagram:FDEViation? (Query Only)

Returns the Frequency Deviation vs Time trace data with the X value.

Conditions

Measurement view: P25 Eye Diagram

Group

Fetch commands

Syntax

`FETCh:P25:EDIagram:FDEViation?`

Returns

`#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)>` and `<X(n)>` are the frequency deviation in Hz and time (symbols) coordinate pair at the *n*th data point. 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`FETCH:P25:EDIAGRAM:FDEVIATION?` might return `#3160xxxx...` (160-byte data) for the Frequency Deviation vs Time trace.

FETCh:P25:EDIagram:FERRor? (Query Only)

Returns the frequency error in the P25 Eye Diagram display.

When Frequency Error is in Auto mode, this query returns the frequency error value. When in Manual mode, it returns the frequency offset.

Conditions

Measurement view: P25 Eye Diagram

Group

Fetch commands

Syntax

`FETCh:P25:EDIagram:FERRor?`

Returns

<feq_error>::<NRf> is the frequency error in Hz.

Examples

`FETCH:P25:EDIAGRAM:FERROR?` might return `-10.7E+3`, indicating the frequency Error is -10.7 kHz.

FETCh:P25:EDIagram:I? (Query Only)

Returns the I versus Time trace data in the P25 Eye Diagram display.

Conditions

Measurement view: P25 Eye Diagram

Group

Fetch commands

Syntax

`FETCh:P25:EDIagram:I?`

Returns

`#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)>` and `<X(n)>` are the normalized I- and time (symbols) coordinate values at the n^{th} data point. 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`FETCH:P25:EDIAGRAM:I?` might return `#3160xxxx...` (160-byte data) for the I versus Time trace.

FETCh:P25:EDIagram:Q? (Query Only)

Returns the Q versus Time trace data in the P25 Eye Diagram display.

Conditions

Measurement view: P25 Eye Diagram

Group

Fetch commands

Syntax

`FETCh:P25:EDIagram:Q?`

Returns

`#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)>` and `<X(n)>` are the normalized Q- and time (symbols) coordinate values at the *n*th data point. 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`FETCH:P25:EDIAGRAM:Q?` might return `#3160xxxx...` (160-byte data) for the Q Versus Time trace.

FETCh:P25:PVTime:BURSt:WIDTh? (Query Only)

Returns the value of the measured time width of the burst packet from poweron to powerdown (or the end of waveform, if that occurs before powerdown), in seconds, for the P25 Power vs. Time trace.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

`FETCh:P25:PVTime:BURSt:WIDTh?`

Returns

Floating point number that represents the value of the measured time width of the burst packet from power on to power down (or the end of waveform, if that occurs before power down), in seconds.

Examples

`FETCH:P25:PVTIME:BURST:WIDTH?` might return `156.0000000000E-6`, which represents a width of the burst packet of 156 µs.

FETCh:P25:PVTime:FALL:TIME:STARt? (Query Only)

Returns the value of the start time of the falling edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

```
FETCh:P25:PVTime:FALL:TIME:STARt?
```

Related Commands

FETCh:P25:PVTime:FALL:TIME:STOP? (on page 1307)

Returns

Floating point number which represents the value of the start time of the falling edge of the burst, in seconds.

Examples

`FETCH:P25:PVTIME:FALL:TIME:START?` might return `6e-6`, which indicates that the start time of the falling edge is at 6 µs.

FETCh:P25:PVTime:FALL:TIME:STOP? (Query Only)

Returns the value of the stop time of the falling edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

```
FETCh:P25:PVTime:FALL:TIME:STOP?
```

Related Commands

FETCh:P25:PVTime:FALL:TIME:STARt? (on page 1306)

Returns

Floating point number which represents the value of the stop time of the falling edge of the burst, in seconds.

Examples

`FETCH:P25:PVTIME:FALL:TIME:STOP?` might return `7e-6`, which indicates the stop time of the falling edge is at 7 µs.

FETCh:P25:PVTime:RISE:TIME? (Query Only)

Returns the value of the width of the rising edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

```
FETCh:P25:PVTime:RISE:TIME?
```

Related Commands

FETCh:P25:PVTime:RTIMe? (on page 1309)

Returns

Floating point number which represents the value of the start time of the rising edge of the burst, in seconds.

Examples

`FETCH:P25:PVTIME:RISE:TIME?` might return `6e-6`, which indicates the start time of the rising edge is 6 µs.

FETCh:P25:PVTime:RISE:TIME:STARt? (Query Only)

Returns the value of the start time of the rising edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

`FETCh:P25:PVTime:RISE:TIME:STARt?`

Related Commands

FETCh:P25:PVTime:RISE:TIME? (on page 1307)

FETCh:P25:PVTime:RTIMe? (on page 1309)

Returns

Floating point number which represents the value of the start time of the rising edge of the burst, in seconds.

Examples

`FETCH:P25:PVTIME:RISE:TIME:START?` might return `6e-6`, which indicates the start time of the rising edge is at 6 µs.

FETCh:P25:PVTime:RISE:TIME:STOP? (Query Only)

Returns the value of the stop time of the rising edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

`FETCh:P25:PVTime:RISE:TIME:STOP?`

Related Commands

FETCh:P25:PVTime:RISE:TIME:STARt? (on page 1307)

FETCh:P25:PVTime:RTIMe? (on page 1309)

FETCh:P25:PVTime:RISE:TIME? (on page 1307)

Returns

Floating point number which represents the value of the stop time of the rising edge of the burst, in seconds.

Examples

`FETCH:P25:PVTIME:RISE:TIME:STOP?` might return `7e-6`, which indicates the width of the rising edge is 7 µs.

FETCh:P25:PVTime:RTIMe? (Query Only)

Returns the value of the width of the rising edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

`FETCh:P25:PVTime:RTIMe?`

Related Commands

FETCh:P25:PVTime:RISE:TIME? (on page 1307)

Returns

Floating point number which represents the value of the width of the rising edge of the burst, in seconds.

Examples

`FETCH:P25:PVTIME:RTIME?` might return `7e-6`, which indicates the width of the rising edge is 7 µs.

FETCh:P25:PVTime:TRACe[:Y]? (Query Only)

Returns the vertical values (power) for the P25 Power vs. Time trace.

Conditions

Measurement view: P25 Power vs. Time

Group

Fetch commands

Syntax

`FETCh:P25:PVTime:TRACe[:Y]?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:P25:PVTIME:TRACE[:Y]?` might return `#43204` (3204-byte data), which represents the vertical values (power) for the P25 Power vs. Time trace.

FETCh:P25:SUMMary:LIMIt: SRA (Query Only)

Returns Limit of Symbol Rate Accuracy measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:LIMIt:SRA`

Arguments

None

Returns

might return `PASS`, `FAIL`, or `NA`.

Examples

`FETCH:P25:SUMMARY:LIMIT:SRA`

FETCh:P25:SUMMary:MODUlation:MEASurement:FIDelity (Query Only)

Returns the Modulation Fidelity measurement result.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:MODUlation:MEASurement:FIDelity`

Arguments

None

Examples

FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FIDELITY

FETCh:P25:SUMMary:MODUlation:MEASurement:FIDelity:STATus (Query Only)

Returns the Modulation Fidelity measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:MODUlation:MEASurement:FIDelity:STATus`

Arguments

None

Returns

PASS means the result passed.

FAIL means the result failed.

NA means there is nothing to return.

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FIDELITY:STATUS` might return `PASS`, `FAIL`, or `NA`.

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:.DEVIation:POSPeak

Returns the Frequency Deviation, positive peak measurement results.

Conditions

Measurement views: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:.DEVIation:POSPeak`

Arguments

<integer>,<integer>

Returns

Frequency Deviation, positive peak, result

Examples

FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:.DEVIATION:POSPEAK <-2,-6> indicates the coordinate value of the Frequency Deviation positive peak.

FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:.DEVIation:POSPeak:STA

Returns the status of Frequency Deviation, positive peak status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:.DEVIation:POSPeak:STATus

Arguments

None

Examples

FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:.DEVIATION:POSPEAK:STATUS might return PASS, FAIL or NA.

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy (Query Only)

Returns the Operational Frequency Accuracy measurement results.

Conditions

Measurement views: P25 Summary

Group

Fetch commands

Syntax

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy

Arguments

None

Returns

Frequency Accuracy measurement result

Examples

FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ACCURACY

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy (Query Only)

Returns the Operational Frequency Accuracy measurement results in the P25 Summary display.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy?`

Arguments

None

Returns

<NRf> Returns Operational Frequency Accuracy

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ACCURACY?` might return `25.62`, indicating the Operational Frequency Accuracy is 25.62 ppm.

FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy:STATus (Query Only)

Returns the status of Frequency Accuracy measurement's result.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy:STATus`

Arguments

None

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ACCURACY:STATUS` might return `PASS`, `FAIL`, or `NA`.

FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak:STATus (Query Only)

Queries the status of Frequency Deviation, negative peak result in the P25 Summary display.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:NEGPEAK:STATUS?` might return `Pass`, indicating that the Frequency Deviation for negative peak test result is Pass.

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak (Query Only)

Returns the Frequency Deviation, negative peak, measurement results.

Conditions

Measurement views: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak`

Arguments

None

Returns

Frequency Deviation measurement result

Examples

FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:NEGPEAK

FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak:STATus (Query Only)

Queries the status of Frequency Deviation, positive peak result in the P25 Summary display.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

FETCh:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak:STATus?

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:POSPEAK:STATUS? might return Pass, indicating that the Frequency Deviation for positive peak test result is Pass.

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak (Query Only)

Returns the Frequency Deviation, positive peak measurement results in the P25 Summary display.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak?

Arguments

None

Returns

<NRf>

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:POSPEAK?` might return `125.63`, indicating the Frequency Deviation positive peak is 125.63 Hz.

FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:ERRor (Query Only)

Returns the Frequency Error measurement results.

Conditions

Measurement views: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:MODUlation:MEASurement:FREQuency:ERRor`

Arguments

None

Returns

Frequency Error measurement result

FETCH:P25:SUMMary:MODUlation:MEASurement:SRA? (Query Only)

Returns the Symbol Rate Accuracy measurement results.

Conditions

Measurement views: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:MODUlation:MEASurement:SRA?`

Arguments

None

Returns

Symbol Rate Accuracy measurement result

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:SRA?`

FETCh:P25:SUMMary:MODUlation:MEASurement:SRA:STATus (Query Only)

Returns Status of Symbol Rate Accuracy measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:MODUlation:MEASurement:SRA:STATus?`

Arguments

None

Returns

PASS, FAIL or NA.

Examples

`FETCH:P25:SUMMARY:MODULATION:MEASUREMENT:SRA:STATUS?` might return `PASS`, indicating that the status is passed.

FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF? (Query Only)

Returns the HCPM Pmax-off measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF?`

Returns

HCPM Pmax-off measurement results.

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXOFF?` would return the HCPM Pmax-off measurement result.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF:STATus? (Query

Returns HCPM Pmax-off measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF:STATus?`

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXOFF:STATUS?` might return `PASS`, `FAIL`, or `NA`.

FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON? (Query Only)

Returns the HCPM Pmax-on measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON?`

Returns

HCPM Pmax-on measurement results.

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXON?` would return HCPM Pmax-on measurement results.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON:STATus? (Query Only)

Returns Status of HCPM Pmax-on measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON:STATus?

Arguments

None

Examples

FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXON:STATUS? might return PASS, FAIL, or NA.

FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSS? (Query Only)

Returns the HCPM Pss-max measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSS?

Returns

HCPM Pss-max measurement results.

Examples

FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXSS? would return the HCPM Pss-max measurement result.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs:STATus (Query Only)

Returns HCPM Pss-max measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs:STATus?

Arguments

None

Examples

FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXSS:STATUS? might return PASS, FAIL, or NA.

FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum? (Query Only)

Returns the HCPM Pss-min measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum?`

Returns

HCPM Pss-min measurement results.

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MINIMUM?` would return the HCPM Pss-min measurement result.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum:STATus? (Query Only)

Returns status of HCPM Pss-min measurement status based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum:STATus?`

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MINIMUM:STATUS?` might return `PASS`, `FAIL`, or `NA`.

FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot? (Query Only)

Returns the HCPM Offslot power results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot?
```

Returns

HCPM Offslot power results.

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:OFFSLOT?` would return the HCPM Offslot power result.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot:STATus? (Query Only)

Returns Status of HCPM Offslot measurement based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot:STATus?
```

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:OFFSLOT:STATUS?` might return `PASS`, `FAIL`, or `NA`.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:HI (Query Only)

Returns P_ACP_HI value which is displayed on P25 Summary display.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:HI?
```

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:HI?` might return `-37.963`, indicating the P_ACP_HI value is -37.96 dBm.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:LOW (Query

Returns P_ACP_LOW value which is displayed on P25 Summary display.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:LOW`

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:LOW?` might return `-40.125`, indicating P_ACP_LOW value is -40.13 dBm.

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN (Query

Returns Min Pk ACPR value which is displayed on P25 Summary Display.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN`

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:MIN?` might return `47.96`, indicating Min Pk ACPR value is 47.96 dBm

FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN:STATus

Returns status of Min Pk ACPR value based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN:STATus`

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:MIN:STATUS?` might return `PASS`, `FAIL`, or `NA`.

FETCh:P25:SUMMary:POWEr:MEASurement:RF (Query Only)

Returns RF measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:POWEr:MEASurement:RF`

Arguments

None

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:RF`

FETCh:P25:SUMMary:POWEr:MEASurement:RF:STATus (Query Only)

Returns Status of RF measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:POWEr:MEASurement:RF:STATus
```

Arguments

None

Returns

PASS, FAIL, or NA.

Examples

`FETCH:P25:SUMMARY:POWER:MEASUREMENT:RF:STATUS` might return `PASS`, indicating that PASS is the status result of the measurement.

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:.ACQ:COUNT (Query Only)

Returns HCPM t_error_1 acquisition count.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:.ACQ:COUNT?
```

Arguments

None

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ONE:.ACQ:COUNT?
```

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:ACQ:COUNT (Query Only)

Returns the HCPM t_error_1 acquisition count in P25 Summary display.

This is applicable when phase 2 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment: TERRor:ONE:ACQ:COUNT?

Arguments

None

Returns

<NR1> Range is 0 to 5

Examples

FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ONE:ACQ:COUNT might return 1, indicating HCPM t_error_1 acquisition count is 1.

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ZERO:STATus (Query Only)

Queries the status of the HCPM Time alignment's t_error_0 measurement results in the P25 Summary display .

This is applicable when phase 2 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ZERO:STATus?

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ZERO:STATUS? might return Pass, indicating that the HCPM Time alignment's t_error_0 measurement test result is Pass.

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:STATus (Query Only)

Returns the Status of HCPM Time alignment's t_error_1 measurement results in P25 Summary display.

This is applicable when phase 2 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR: ONE:STATUS?` might return `Pass`, indicating that the HCPM Time alignment's t_error_1 measurement test result is Pass.

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ZERO:ACQ:COUNT (Query Only)

Returns the HCPM t_error_0 acquisition count in P25 Summary display.

This is applicable when phase 2 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ZERO:ACQ:COUNT?`
`Arguments`

None

Returns

<NR1> Range is 0 to 5

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ZERO:ACQ:COUNT` might return `3`, indicating HCPM t_error_0 acquisition count is 3.

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:.ZERO:S(Query Only)

Returns status of HCPM Time alignment's t_error_0 measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:.ZERO:STATus?`

Arguments

None

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:.ZERO:STATUS?` might return `PASS`, `FAIL`, or `NA`.

FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:.ACQ:COUNT?(Query Only)

Returns the HCPM Time alignment's t_error_1 acquisition count over which the t_error_1 average is computed.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:.ACQ:COUNT?`

Returns

HCPM Time alignment's t_error_1 acquisition count.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ONE:.ACQ:COUNT?`

FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:?(Query Only)

Returns the HCPM Time alignment's t_error_1 measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE?
```

Returns

HCPM Time alignment's t_error_1 measurement results.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ONE?
```

FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ZERO?

Returns the HCPM Time alignment's t_error_0 measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ZERO?
```

Returns

HCPM Time alignment's t_error_0 measurement results.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ZERO?
```

FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TOBSync? (Query Only)

Returns the HCPM Time alignment's t_obsync measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TOBSync?
```

Returns

HCPM Time alignment's t_obsync measurement results.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TOBSYNC?
```

FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TOBSync:ACQ:COUNT (Query Only)

Returns the HCPM Time alignment's tob_sync acquisition count in P25 Summary display.

This is applicable when phase 2 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TOBSync:ACQ:COUNT?`

Arguments

None

Returns

<NR1> Range is 0 to 5

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TOBSYNC:ACQ:COUNT?` might return `2`, indicating HCPM Time alignment's tob_sync acquisition count is 2.

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:.ENCOder? (Query Only)

Returns the Average Transmitter Encoder Attack Time measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:.ENCOder?`

Returns

Average Transmitter Encoder Attack Time measurement results.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:.ENCODER?`

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:.ENCOder:BI:STAT(Query Only)

Returns status of Average Transmitter Power Encoder Attack Time, busy/idle, measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:.ENCOder:BI:STATus?`

Arguments

None

Returns

Average Transmitter Encoder Attack Time , busy/idle, measurement results.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:.ENCODER:BI:STATUS?` might return `PASS`, `FAIL`, or `NA`.

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder: STATus (Query Only)

Returns the Status of Average Transmitter Encoder Attack Time measurement results in P25 Summary display.

This is applicable when phase 1 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER:STATUS?` might return `Pass`, indicating that Average Transmitter Encoder Attack Time measurement test result is Pass.

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI (Query Only)

Returns Average Transmitter Power Attack Time, busy/idle measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI
```

Arguments

None

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER:BI
```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ACQ:COUNT(Query Only)

Returns Average Transmitter Power Attack acquisition count.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ACQ:COUNT?
```

Arguments

None

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ACQ:COUNT?` might return `PASS`, `FAIL`, or `NA`.

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ACQ:COUNT:BI(Query Only)

Returns the Average Transmitter Power Attack, busy/idle count in the P25 Summary display.

This is applicable when phase 1 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ACQ:COUNT:BI?`

Arguments

None

Returns

<NR1>Range is 0 to 10

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ACQ:COUNT:BI?` might return `8`, indicating Average Transmitter Power Attack,busy/idle count is 8.

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:BI:STATus (Query Only)

Returns the Status of Average Transmitter Encoder Attack Time (Busy/Idle) measurement results in P25 Summary display.

This is applicable when phase 1 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder: BI:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER:BI:STATUS?` might return `Pass`, indicating that the Average Transmitter Encoder Attack Time (Busy/Idle) measurement test result was Pass.

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder: STATus (Query Only)

Returns the Status of Average Transmitter Encoder Attack Time measurement results in P25 Summary display.

This is applicable when phase 1 is selected as the standard in the Modulation Params tab.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER:STATUS?` might return `Pass`, indicating that Average Transmitter Encoder Attack Time measurement test result is Pass.

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder?(Query Only)

Returns the Average Transmitter Encoder Attack Time measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

`FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder?`

Returns

Average Transmitter Encoder Attack Time measurement results.

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER?`

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:BI?(Query Only)

Returns the Average Transmitter Encoder Attack Time, busy/idle, measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:BI?
```

Returns

Average Transmitter Encoder Attack Time , busy/idle, measurement results.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER:BI?
```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr (Query Only)

Returns Average Transmitter Power Attack Time measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr

```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI:STATus(Query Only)

Returns status of Average Transmitter Power Attack Time, busy/idle, measurement results based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI:STATus
```

Arguments

None

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER:BI:STATUS` might return PASS, FAIL or NA.

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI?(Query Only)

Returns the Average Transmitter Power Attack Time, busy/idle, measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI?
```

Returns

Average Transmitter Power Attack Time, busy/idle, measurement results.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER:BI?
```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME: POWEr:STATus (Query Only)

Returns status of Average Transmitter Power Attack Time measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:STATus
```

Arguments

None

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER:STATUS` might return `PASS`, `FAIL`, or `NA`.

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck: TIME:POWEr?(Query Only)

Returns the Average Transmitter Power Attack Time measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr?
```

Returns

Average Transmitter Power Attack Time measurement results.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER?
```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy (Query Only)

Returns Throughput delay measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy
```

Arguments

None

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY
```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT (Query Only)

Returns Throughput delay acquisition counts.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT
```

Arguments

None

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY:ACQ:COUNT
```

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT?(Query Only)

Returns the Throughput delay acquisition counts over which the Throughput delay average is computed.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT?
```

Returns

Throughput delay acquisition counts.

Examples

```
FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY:ACQ:COUNT?
```

FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:STATus (Query Only)

Returns status of Throughput delay measurement results based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Fetch commands

Syntax

```
FETCh:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:STATus
```

Arguments

None

Examples

`FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY:STATUS` might return `PASS`, `FAIL`, or `NA`.

FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy? (Query Only)

Returns the Throughput delay measurement results.

Conditions

Measurement view: P25 Summary

Group

Fetch commands

Syntax

```
FETCH:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy?
```

Returns

Throughput delay measurement results.

Examples

FETCH:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY?

FETCh:PERRor[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Fetch commands

Syntax

FETCh:PERRor[:MEASview<y>]:FERRor?

Arguments

None

Returns

<freq_error>::<NRf> is the frequency error in Hz.

Examples

FETCh:PERRor:MEASview2:FERRor? might return -10.7E+3, indicating the frequency error is -10.7 kHz for measurement view2.

FETCh:PERRor[:MEASview<y>]:PEAK? (Query only)

Returns the peak value in the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Fetch commands

Syntax

FETCh:PERRor[:MEASview<y>]:PEAK?

Related Commands

FETCh:PERRor[:MEASview<y>]:PINDex? (on page 1340)

Arguments

None

Returns

<peak>::<NRf> is the peak phase error in percent (%).

Examples

FETCh:PERRor:MEASview2:PEAK? might return 1.57, indicating the peak phase error value is 1.57% for measurement view 2.

FETCh:PERRor[:MEASview<y>]:PINDex? (Query only)

Returns the time at the phase error peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Fetch commands

Syntax

```
FETCh:PERRor[:MEASview<y>]:PINDex?
```

Related Commands

FETCh:PERRor[:MEASview<y>]:PEAK? (on page 1339)

Arguments

None

Returns

<peak_time>::<NRf> is the time at the phase error peak in symbol number.

The unit can be changed by [SENSe]:DDEMod:TIMe:UNITs command.

Examples

FETCh:PERRor:MEASview2:PINDex? might return 68.000, indicating that the Phase error peak is at symbol #68 for measurement view 2.

FETCh:PERRor[:MEASview<y>]:RMS? (Query only)

Returns the RMS (Root-Mean-Square) value in the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Fetch commands

Syntax

`FETCh:PERRor[:MEASview<y>]:RMS?`

Arguments

None

Returns

`<rms>::<NRf>` is the RMS phase error in percent (%).

Examples

`FETCh:PERRor:MEASview2:RMS?` might return 0.382, indicating the RMS Phase error value is 0.382% for measurement view 2.

FETCh:PERRor[:MEASview<y>]:TRACe? (Query only)

Returns the Phase error versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Fetch commands

Syntax

`FETCh:PERRor[:MEASview<y>]:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the phase error in degrees at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCh:PERRor:MEASview2:TRACe? might return #42036xxxx... (2036-byte data) for the Phase error versus Time Measview 2.

FETCh:PHVTime[:MEASview<y>]? (Query Only)

Returns the Phase versus Time trace data.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

FETCh:PHVTime[:MEASview<y>]?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the phase in degrees at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:PHVTIME:MEASview1? might return #3160xxxx... (160-byte data) for the Phase versus Time trace.

FETCh:PHVTime[:MEASview<y>]:MAXimum? (Query Only)

Returns the maximum value in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

FETCh:PHVTime[:MEASview<y>]:MAXimum?

Related Commands

FETCh:PHVTime[:MEASview<y>]:MAXLocation? (on page 1343)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<max>::<NRf> is the maximum phase in degrees.

Examples

FETCH:PHVTIME:MEASview1:MAXIMUM? might return 153.8, indicating the maximum phase is 153.8°.

FETCh:PHVTime[:MEASview<y>]:MAXLocation? (Query Only)

Returns the time at which the phase is maximum.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

FETCh:PHVTime[:MEASview<y>]:MAXLocation?

Related Commands

FETCh:PHVTime[:MEASview<y>]:MAXimum? (on page 1342)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<max_time>::<NRf> is the time in seconds at which the phase is maximum.

Examples

FETCH:PHVTIME:MEASview1:MAXLOCATION? might return 175.3E-9, indicating the I or Q level is maximum at 175.3 ns.

FETCh:PHVTime[:MEASview<y>]:MINimum? (Query Only)

Returns the minimum value in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

FETCh:PHVTime[:MEASview<y>]:MINimum?

Related Commands

FETCh:PHVTime[:MEASview<y>]:MINLocation? (on page 1344)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min>::<NRf> is the minimum phase in degrees.

Examples

FETCH:PHVTIME:MEASview1:MINIMUM? might return -176.3, indicating the minimum phase is -176.3°.

FETCh:PHVTime[:MEASview<y>]:MINLocation? (Query Only)

Returns the time at which the phase is minimum.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

FETCh:PHVTime[:MEASview<y>]:MINLocation?

Related Commands

FETCh:PHVTime[:MEASview<y>]:MINimum? (on page 1343)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min_time>::<NRf> is the time in seconds at which the phase is minimum.

Examples

FETCH:PHVTIME:MEASview1:MINLOCATION? might return 450.7E-9, indicating the phase is minimum at 450.7 ns.

FETCh:PHVTime[:MEASview<y>]:OGRAm? (Query only)

Returns trace data of a line in the ogram. The line is selected using the TRACe:PHVTime[:MEASview<y>]:OGRAm:SELect:LINE command.

Conditions

Applicable measurement view must be active.

Group

Fetch commands

Syntax

`FETCh:PHVTime[:MEASview<y>]:OGRAm?`

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in <num_byte>.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the phase at the n^{th} data point in degrees (deg), represented as a 4-byte little-endian IEEE 488.2 floating-point value.

Examples

`FETCh:PHVTime:MEASview1:OGRAm?` might return #43204xxxx... (3204-byte data) for the line in the ogram.

FETCh:PHVTime[:MEASview<y>]:RESult? (Query Only)

Returns the Phase versus Time measurement results.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

`FETCh:PHVTime[:MEASview<y>]:RESult?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<max>,<max_time>,<min>,<min_time>`

Where

`<max>::<NRf>` is the maximum phase in degrees.

`<max_time>::<NRf>` is the time in seconds at which the phase is maximum.

`<min>::<NRf>` is the minimum phase in degrees.

`<min_time>::<NRf>` is the time in seconds at which the phase is minimum.

Examples

`FETCH:PHVTIME::MEASview1:RESULT?` might return `153.8,175.3E-9,-176.3,450.7E-9`, indicating the maximum phase is 153.8 ° at 175.3 ns and the minimum phase is -176.3 ° at 450.7 ns.

FETCh:PHVTime[:MEASview<y>]:TRACe:BITMap? (Query Only)

Returns trace waveform data of the bitmap trace in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Fetch commands

Syntax

`FETCh:PHVTime[:MEASview<y>]:TRACe:BITMap?`

Arguments

None

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

A binary block of 32-bit floating point values (IEEE standard single precision floating point format). Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Bitmaps have 201 rows. Data[0] is the first column in the first row, and the following data continues along that row before moving to the next.

Bitmap values are returned in the order of top left pixel first, then the rest of the top row, after that row by row.
In other words, the pixels in the bitmap are returned from left to right and top to bottom; one row at a time.

Examples

`FETCH:PHVTIME:TRACE:BITMAP?` might return #6644004xxxx...

FETCh:PM:PNEGative? (Query Only)

Returns the negative peak phase deviation (–Pk) in the PM measurement.

Conditions

Measurement views: PM

Group

Fetch commands

Syntax

`FETCh:PM:PNEGative?`

Arguments

None

Returns

`<-Pk>::<NRf>` is the negative peak phase deviation in degrees.

Examples

FETCH:PM:PNEGATIVE? might return -23.42, indicating the positive peak phase deviation is -23.42 °.

FETCh:PM:PPOSitive? (Query Only)

Returns the positive peak phase deviation (+Pk) in the PM measurement.

Conditions

Measurement views: PM

Group

Fetch commands

Syntax

FETCh:PM:PPOSitive?

Arguments

None

Returns

<+Pk>::<NRf> is the positive peak phase deviation in degrees.

Examples

FETCH:PM:PPOSITIVE? might return 26.87, indicating the positive peak phase deviation is 26.87 °.

FETCh:PM:PTPeak? (Query Only)

Returns the peak-peak phase deviation (Pk-Pk) in the PM measurement.

Conditions

Measurement views: PM

Group

Fetch commands

Syntax

FETCh:PM:PTPeak?

Arguments

None

Returns

<Pk-Pk>::<NRf> is the peak-peak phase deviation in degrees.

Examples

FETCH:PM:PTPEAK? might return 46.34, indicating the peak-peak phase deviation is 46.34 °.

FETCh:PM:RESult? (Query Only)

Returns the PM measurement results.

Conditions

Measurement views: PM

Group

Fetch commands

Syntax

`FETCh:PM:RESult?`

Arguments

None

Returns

`<+Pk>,<-Pk>,<RMS>,<Pk-Pk>`

Where

`<+Pk>::<NRf>` is the positive peak phase deviation in degrees.

`<-Pk>::<NRf>` is the negative peak phase deviation in degrees.

`<RMS>::<NRf>` is the RMS phase deviation in degrees.

`<Pk-Pk>::<NRf>` is the peak-peak phase deviation in degrees.

Examples

`FETCH:PM:RESULT?` might return `22.89,-23.45,15.12,46.34`.

FETCh:PM:RMS? (Query Only)

Returns the RMS phase deviation in the PM measurement.

Conditions

Measurement views: PM

Group

Fetch commands

Syntax

`FETCh:PM:RMS?`

Arguments

None

Returns

`<RMS>::<NRf>` is the RMS phase deviation in degrees.

Examples

`FETCH:PM:RMS?` might return 15.12, indicating the RMS frequency deviation is 15.12 °.

FETCh:PNOise:ALL? (Query Only)

Returns all results of the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:ALL?`

Arguments

None

Returns

`<Cpower>,<Ferror>,<Pnoise>,<Tjitter>,<Rjitter>,<RFM>`

Where

`<Cpower>::<NRf>` is the carrier power in dBm.

`<Ferror>::<NRf>` is the frequency error in Hz.

`<Pnoise>::<NRf>` is the RMS phase noise in degrees.

`<Tjitter>::<NRf>` is the total jitter in seconds.

`<Rjitter>::<NRf>` is the random jitter in seconds.

`<RFM>::<NRf>` is the residual FM in Hz.

Examples

`FETCH:PNOISE:ALL?` might return -9.455,1.235E+6,51.43,2.312E-9,4.178E-9,14.58, indicating Carrier power: -9.455 dBm, Frequency error: 1.235 MHz, RMS phase noise: 51.43 °, Total jitter: 2.312 ns, Random jitter: 4.178 ns, and Residual FM: 14.58 Hz.

FETCh:PNOise:CARRier:FERRor? (Query Only)

Returns the carrier frequency error in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:CARRier:FERRor?`

Arguments

None

Returns

`<NRf>` Carrier frequency error in Hz.

Examples

FETCH:PNOISE:CARRIER:FERROR? might return 1.235E+6, indicating that the carrier frequency error is 1.235 MHz.

FETCh:PNOise:CARRier:POWer? (Query Only)

Returns the carrier power in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

FETCh:PNOise:CARRier:POWer?

Arguments

None

Returns

<NRf> Carrier power in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

FETCH:PNOISE:CARRIER:POWER? might return -9.455, indicating that the carrier power is -9.455 dBm.

FETCh:PNOise:JITTer? (Query Only)

Returns the jitter in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

FETCh:PNOise:JITTer?

Arguments

None

Returns

<NRf> Jitter in seconds.

Examples

FETCH:PNOISE:JITTER? might return 2.312E-9, indicating that the jitter is 2.312 ns.

FETCh:PNOise:RESidual:FM? (Query Only)

Returns the residual FM in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:RESidual:FM?`

Arguments

None

Returns

`<NRf>` Residual FM in Hz.

Examples

`FETCH:PNOISE:RESIDUAL:FM?` might return 14.58, indicating that the residual FM is 14.58 Hz.

FETCh:PNOise:RMS:PNOise? (Query Only)

Returns the RMS phase noise in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:RMS:PNOise?`

Arguments

None

Returns

`<NRf> RMS` phase noise in degrees.

Examples

`FETCH:PNOISE:RMS:PNOISE?` might return 51.43, indicating that the RMS phase noise is 51.43 °.

FETCh:PNOise:SPECtrum<x>:X? (Query Only)

Returns the frequencies of the specified trace.

The parameter <x> = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:SPECtrum<x>:X?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)>` is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:PNOISE:SPECTRUM1:X?` might return #516020xxxx... (16020-byte data) for the frequencies of Trace 1.

FETCh:PNOise:SPECtrum<x>:XY? (Query Only)

Returns the frequency and phase noise pairs of the specified trace.

The parameter <x> = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:SPECtrum<x>:XY?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)><y(n)>` is the frequency (Hz) and phase noise (dBc/Hz) pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:PNOISE:SPECTRUM1:XY?` might return #516020xxxx... (16020-byte data) for the frequency and phase noise pairs of the Trace 1.

FETCh:PNOise:SPECtrum<x>[:Y]? (Query Only)

Returns the phase noise values of the specified trace.

The parameter <x> = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Phase noise

Group

Fetch commands

Syntax

`FETCh:PNOise:SPECtrum<x>[:Y]?`

Arguments

None

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<y(n)>` is the phase noise (dBc/Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:PNOISE:SPECTRUM1:Y` might return `#516020xxxx...` (16020-byte data) for the phase noise values of Trace 1.

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:HIGHer? (Query Only)

Returns the outliers value exceeding the upper limit in pulse cumulative histogram.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Fetch commands

Syntax

`FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:HIGHer?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>` Number of outliers above higher limit

Examples

FETCH:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:OUTLIER:HIGHER? might return 0.000, which is the value for the outliers that have exceeded the upper limit in the pulse cumulative histogram.

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:LOWer? (Query Only)

Returns the outliers value below the lower limit in pulse cumulative histogram.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Fetch commands

Syntax

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:LOWer?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf> Number of outliers below lower limit

Examples

FETCH:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:OUTLIER:LOWER? might return 0.000, which is the value for the outliers below the lower limit in the pulse cumulative histogram.

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:COUNt? (Query Only)

Returns the number of pulses in the bin in the pulse cumulative histogram.

Conditions

Measurement views: Pulse Cumulative Histogram

Group

Fetch commands

Syntax

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:COUNt?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf> Number of pulses in the bin

Examples

FETCH:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:PULSE:COUNT? might return 0 for the number of pulses in the bin.

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:TOTal? (Query Only)

Returns the total number of pulses in the pulse cumulative histogram.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Fetch commands

Syntax

FETCh:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:TOTal?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf> Total number of pulses

Examples

FETCH:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:PULSE:TOTAL? might return 16 for total number pulses in the pulse cumulative histogram.

FETCh:PULSe:CUMulative:STATistics[:MEASview<y>]

Returns the PulseCount, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average and Standard Deviation values for the chosen measurement in the pulse cumulative statistics display.

Conditions

Measurement views: Pulse Cumulative Statistics

Group

Fetch commands

Syntax

FETCh:PULSe:CUMulative:STATistics[:MEASview<y>] <arg1>,<arg2>

Arguments

arg1 can be one of the following measurements:

{AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio | RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb| PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror |MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude | IRTime | PPPD| PPFD | FABS}

arg2 can be one of the following statistics results:

{TPCOunt|MAX|MAXTs|MIN|MINTs|PK2PK|AVG|SD|ALL}

Returns

<puls_cnt>|<max>|<max_timstmp>|<min>|<min_timstmp>|pk_pk>|std_dev>|< for one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq><rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev><phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>

Where

<avg_on>::<NRf> is the average power transmitted during pulse ON.

<pk_pwr>::<NRf> is the Maximum power during pulse on.

<pk_pwr>::<NRf> is the average power transmitted.

<width>::<NRf> is the time from the rising edge to the falling edge at the –3 dB/–6 dB level (50%) of the user selected 100% level.

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level.

<fall>::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level.

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge.

<rep_rate>::<NRf> is the inverse of repetition interval.

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage.

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period.

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top.

<ripple_db>::<NRf> is the Ripple measurement expressed in dB.

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time.

<droop_db>::<NRf> is the Droop measurement expressed in dB.

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge.

<ovrshoot_db>::<NRf> is the Over shoot measurement expressed in dB.

<p2p_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window.

<p2p_freq>::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse.

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time.

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace.

<pp_phase>::<NRf> is the frequency difference between the current pulse and the first pulse.

<pp_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse.

<pk_phase_err>::<NRf> is the maximum phase error.

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point.

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time.

<phase_dev>::<NRf> is the difference between the maximum and minimum Phase values measured during the ON time of a pulse.

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency.

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe.

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe.

Examples

FETCh:PULSe:CUMulative:STATistics:MEASview1 AVERage,MAX might return -1.3594852284, which is the max average value for the Average ON measurement.

FETCh:PULSe:CUMulative:STATistics[:MEASview<y>](Query Only)

Returns the PulseCount, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average, and Standard Deviation values for the chosen measurement in the Pulse Cumulative Statistics display.

Conditions

Measurement views: Pulse Cumulative Statistics

Group

Fetch commands

Syntax

FETCh:PULSe:CUMulative:STATistics[:MEASview<y>]? <arg1><arg2>

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<arg1> = {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror |MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude | IRTime | PPPD| PPFD | FABS}

<arg2> = {TPCOunt | MAX | MAXTs | MIN | MINTs | PK2PK | AVG | SD | ALL}

Returns

<puls_cnt> | <max> | <max_timstmp> | <min> | <min_timstmp> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>::<NRf> is the average power transmitted

<width>::<NRf> is the time from the rising edge to the falling edge at the –3 dB /–6 dB level (50%) of the user selected 100% level

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall>::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate>::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq>::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

Examples

FETCh:PULSe:CUMulative:STATistics:MEASview1? AVERage,MAX might return -1.3594852284, indicating the max value for Average ON is -1.3594852284.

FETCh:PULSe:OGRAm[:MEASview<y>]:MAX:FRAMe:COUNt (Query Only)

Queries the frame count value in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Fetch commands

Syntax

`FETCh:PULSe:OGRAm[:MEASview<y>]:MAX:FRAMe:COUNt?`

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<NRf> Total number of fast frames

Examples

`FETCh:PULSe:OGRAm:MEASview1:MAX:FRAMe:COUNt?` might return `15`, indicating the total number of fast frames in the acquisition of pulse-Ogram is 15.

FETCh:PULSe:OGRAm[:MEASview<y>]:RBW (Query Only)

Queries the resolution bandwidth value only when Frequency vs Time display is opened in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Fetch commands

Syntax

`FETCh:PULSe:OGRAm[:MEASview<y>]:RBW?`

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<NRf>

Examples

`FETCh:PULSe:OGRAm:MEASview1:RBW?` might return `222.9199886322E+3`, indicating the RBW value in Pulse-Ogram is 222.9199886322E+3.

FETCh:PULSe[:RESult][:MEASview<y>]:ADVanced (Query Only)

Queries the PulseCount, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average, and Standard Deviation values for the chosen measurement in the Pulse Table display.

Conditions

Measurement views: Pulse Table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:ADVanced <arg1><arg2>

Arguments

<arg1>={Pulse_number}

<arg2>= {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror |MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude|TIME | IRTime | PPPD| PPFD | FABS}

Returns

<puls_cnt> | <max> | <max_timstmp> | <min> | <min_timstmp> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>:: <NRf> is the average power transmitted

<width>::<NRf> is the time from the rising edge to the falling edge at the −3 dB/ −6 dB level (50%) of the user selected 100% level

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set

Examples

FETCH:PULSE[:RESULT]:MEASview1:ADVANCED 1,AVERage might return -1.4063608208, indicating the average ON value for the pulse number 1 is -1.4063608208.

FETCh:PULSe[:RESult][:MEASview<y>]:ADVanced:RANGe (Query only)

Queries the Pulse Count, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average, and Standard Deviation values for the selected measurement in the Pulse Table display.

Conditions

Measurement views: Pulse Table

Group

Fetch commands

Syntax

```
FETCh:PULSe[:RESult][:MEASview<y>]:ADVanced:RANGe <arg1><arg2><arg3>
```

Arguments

<arg1>={Start_Pulse_number}

<arg2>={End_Pulse_number}

<arg3>= {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror |MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude|TIME | IRTime | PPPD| PPFD | FABS}

Returns

<puls_cnt> | <max> | <max_timstmp> | <min> | <min_timstmp> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number.

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on.

<avg_tx>:: <NRf> is the average power transmitted .

<width>::<NRf> is the time from the rising edge to the falling edge at the –3 dB or –6 dB level (50%) of the user selected 100% level.

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% or (20% to 80%) of the user selected 100% level.

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% or (80% to 20%) of the user selected 100% level.

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge.

<rep_rate> ::<NRf> is the inverse of repetition interval.

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage.

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period.

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top.

<ripple_db>::<NRf> is the Ripple measurement expressed in dB.

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse on time.

<droop_db>::<NRf> is the Droop measurement expressed in dB.

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge.

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB.

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window.

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse.

<rms_phase_err>::<NRf> is the RMS average of the Phase versus Time trace, computed over the Measurement Time.

<rms_freq_err>::<NRf> is the RMS average of the Freq error versusTime trace.

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse.

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse.

<pk_phase_err>::<NRf> is the maximum phase error.

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point.

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time.

<phase_dev>::<NRf> is the Phase deviation difference between the maximum and minimum Phase values measured during the on time of a pulse.

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency.

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe.

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe .

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set.

Example

FETCH:PULSE[:RESULT]:MEASview1:ADVANCED:RANGe 2048,2060,AVERage might return -3,23.8467659801E-3,23.8566566259E-3,23.8667335361E-3,23.8771531731E-3, 23.8866508007E-3,23.8966420293E-3,23.9066667855E-3,23.9170398563E-3, 23.9367540926E-3,23.9467956126E-3,23.9567346871E-3,23.9670332521E-3, 23.9866096526E-3,2, indicating the average ON value for the pulse number 2048 to 2060.

FETCh:PULSe[:RESult][:MEASview<y>]:ATX? (Query Only)

Returns the average transmitted power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:ATX?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<ATX(1)>,< ATX(2)>,...<ATX(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<ATX(n)>::<NRf> is the average transmitted power for the pulse with the number of [first_pulse_num + n - 1] in dBm.

The unit can be changed to watts by the [SENSe]:POWer:UNITs command. This measurement gives valid results only for power units (Watts, dBm, dBuW, dBW).

Examples

FETCH:PULSE:RESULT:MEASview1:ATX? might return 0,-18.57,-18.73,-18.20, -18.53 for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:AVERage? (Query Only)

Returns the average on power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:AVERage?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,< avg(1)>,< avg(2)>,...<avg(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<avg(n)>::<NRf>` is the average on power for the pulse with the number of [first_pulse_num + n - 1] in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

This measurement gives valid results only for power units (Watts, dBm, dBuW, dBW).

Examples

`FETCH:PULSE:RESULT:MEASview1:AVERAGE?` might return `0,-2.354,-2.368,-2.343,-2.358` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:DRODb? (Query Only)

Returns the droop in dB in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:DRODb?`

Related Commands

FETCh:PULSe[:RESult][:MEASview<y>]:DROop? (on page 1364)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<droop(1)>,<droop(2)>,...<droop(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<droop(n)>::<NRf>` is the droopdB for the pulse number [first_pulse_num + n - 1] in percent (%) of watts or volts.

Examples

`FETCH:PULSE:RESULT:MEASview1:DRODB?` might return `1,-0.4,0.32,0.2,-0.1` for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:DROop? (Query Only)

Returns the droop in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:DROop?`

Related Commands

FETCh:PULSe[:RESult][:MEASview<y>]:DRODb? (on page 1364)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<droop(1)>,<droop(2)>,...<droop(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<droop(n)>::<NRf>` is the droop for the pulse number [first_pulse_num + n - 1] in percent (%) of watts or volts.

Examples

`FETCH:PULSE:RESULT:MEASview1:DROOP?` might return `0,-270.9E-3,-193.0E-3,-242.7E-3,-177.5E-3` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:DUTPct? (Query Only)

Returns the duty factor (%) in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:DUTPct?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<duty_pct(1)>,<duty_pct(2)>,...<duty_pct(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<duty_pct(n)>::<NRf>` is the duty factor for the pulse with the number of [first_pulse_num + n - 1] in percent (%).

Examples

`FETCH:PULSE:RESULT:MEASview1:DUTPCT?` might return `0,28.94,28.96,29.00,29.01` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:DUTRatio? (Query Only)

Returns the duty factor (ratio) in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:DUTRatio?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<duty_ratio(1)>,<duty_ratio(2)>,...<duty_ratio(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<duty_ratio(n)>::<NRf>` is the duty factor for the pulse with the number of [first_pulse_num + n - 1] (no unit).

Examples

`FETCH:PULSE:RESULT:MEASview1:DUTRATIO?` might return `0,289.4E-3,289.6E-3, 290.0E-3,290.1E-3` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:FABS? (Query Only)

Returns the computed absolute frequency from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:FABS?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<abs_freq(1)>,<abs_freq(2),. <abs_freq(n)>`

Where

<first_pulse_num>::<NR1> is the first pulse number.

<abs_freq(n)>::<NR1> is the absolute frequency for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

FETCH:PULSE[:RESULT]:MEASview1:FABS? might return 1.0000000000, 919.8726400000E+6, 1.1664642560E+9, 1.1866586880E+9, 1.1867939840E+9, 1.1882243840E+9, 933.2595840000E+6, 1.1729175040E+9, 1.1818649600E+9, 1.1868037120E+9, 1.1832893440E+9, 933.4762880000E+6, 1.1805880320E+9, 1.1844794880E+9, 1.1914785280E+9, 1.1929450240E for is the number of the first pulse and the absolute frequency for each pulse.

FETCh:PULSe[:RESult][:MEASview<y>]:FALL? (Query Only)

Returns the fall time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:FALL?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<fall(1)>,<fall(2)>,...<fall(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<fall(n)>::<NRf> is the fall time for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

FETCH:PULSE:RESULT:MEASview1:FALL? might return 0,110.3E-9,90.45E-9, 95.03E-9,111.9E-9 for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:FDELta? (Query Only)

Returns the computed delta frequency from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:FDELta?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<freq_delta(1)>,<freq_delta(2)>,...<freq_delta(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<freq_delta(n)>::<NRf> is the frequency delta for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

FETCH:PULSE:RESULT:MEASview1:FDELTA? might return 1.0000000000,163.6692962646,82.8298492432,21.8995475769,89.2963562012,4 for the first pulse and each pulse found.

FETCh:PULSe[:RESult][:MEASview<y>]:FRDeviation? (Query Only)

Returns the frequency deviation in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:FRDeviation?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<freq_dev(1)>,<freq_dev(2)>,...<freq_dev(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<freq_dev(n)>::<NRf> is the frequency deviation for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

FETCH:PULSE:RESULT:MEASview1:FRDEVIATION? might return 1,740.6E+3, 736.5E+3,718.3E+3,672.2E+3 for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:IRAMplitude? (Query Only)

Returns the pulse impulse response amplitude measurement in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:IRAMplitude?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<amplitude(1)>,<amplitude(2)>,...<amplitude(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<amplitude(n)>::<NRf>` is the sidelobe level, in dB, from the mainlobe for the pulse with the number of [first_pulse_num + n - 1].

Examples

`FETCH:PULSE:RESULT:MEASview1:IRAMPLITUDE?` might return `1.0000000000,-45.3,-47.5,-50.2` for Pulse 1 through 3.

FETCh:PULSe[:RESult][:MEASview<y>]:IRTime? (Query Only)

Returns the impulse response time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:IRTime?`

Returns

`<first_pulse_num>, <time(1>), <time(2)>,. <time(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<time(n)>::<NRf>` is the sidelobe offset time from the mainlobe for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`FETCH:PULSE:RESULT:MEASview1:IRTIME?` might return `1.0000000000,806.6708687693E-9,-846.6595318168E-9,-873.3477443457E-9` for Pulse 1 through 3.

FETCh:PULSe[:RESult][:MEASview<y>]:MFReqerror? (Query Only)

Returns the maximum frequency error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:MFReqerror?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<max_freq_err(1)>,<max_freq_err(2)>,...<max_freq_err(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<max_freq_err(n)>::<NRf>` is the maximum frequency error for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`FETCH:PULSE:RESULT:MEASview1:MFREQERROR?` might return `1,597.5E+3,675.8E+3,642.8E+3,598.2E+3` for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:MPHerror? (Query Only)

Returns the maximum phase error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:MPHerror?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<max_phase_err(1)>,<max_phase_err(2)>,...<max_phase_err(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

<max_phase_err(n)>::<NRf> is the maximum phase error for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

FETCH:PULSE:RESULT:MEASview1:MPHERROR? might return 1,-9.221,-8.413, -11.853,-10.258 for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:OVEDb? (Query Only)

Returns the overshoot in dB in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:OVEDb?

Related Commands

FETCh:PULSe[:RESult][:MEASview<y>]:OVERshoot? (on page 1371)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<overshoot(1)>,<overshoot(2)>,...<overshoot(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<overshoot(n)>::<NRf> is the overshoot for the pulse with the number of [first_pulse_num + n - 1] in dB.

Examples

FETCH:PULSE:RESULT:MEASview1:OVERDB? might return 1,1.2,2.3,1.0,0.2 for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:OVERshoot? (Query Only)

Returns the overshoot in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:OVERshoot?

Related Commands

FETCh:PULSe[:RESult][:MEASview<y>]:OVEDb? (on page 1371)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<overshoot(1)>,<overshoot(2)>,...<overshoot(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<overshoot(n)>::<NRf>` is the overshoot for the pulse with the number of [first_pulse_num + n - 1] in percent (%) of watts or volts.

Examples

`FETCH:PULSE:RESULT:MEASview1:OVERSHOOT?` might return `1,1.2,2.3,1.0,0.2` for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:PHDeviation? (Query Only)

Returns the phase deviation in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:PHDeviation?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<phase_dev(1)>,<phase_dev(2)>,...<phase_dev(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<phase_dev(n)>::<NRf>` is the phase deviation for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

`FETCH:PULSE:RESULT:MEASview1:PHDEVIATION?` might return `1,11.658,9.640,10.509,8.272` for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:PPFD? (Query Only)

Returns the computed pulse to pulse frequency difference from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

```
FETCh:PULSe[:RESult][:MEASview<y>]:PPFD?
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

```
<first_pulse_num>,<ppfd(1)>,<ppfd(2),. <ppfd(n)>
```

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<ppfd(n)>::<NRf>` is the pulse to pulse frequency difference with the number of [first_pulse_num + n - 1] in Hz.

Examples

`FETCH:PULSE[:RESULT]:MEASview1:PPFD?` might return `1.0000000000,"-", 246.5916160000E+6, 20.1943520000E+6, 135.2960000000E+3, 1.4304160000E+6, -254.9647520000E+6, 239.6579520000E+6, 8.9474560000E+6, 4.9386560000E+6, -3.5143840000E+6, -249.8130240000E+6, 247.1117760000E+6, 3.8915200000E+6, 6.9989120000E+6, 1.4665920000E+6` is the number of the first pulse and the pulse frequency difference for each pulse.

FETCh:PULSe[:RESult][:MEASview<y>]:PPFRequency? (Query Only)

Returns the pulse-pulse carrier frequency in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

```
FETCh:PULSe[:RESult][:MEASview<y>]:PPFRequency?
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

```
<first_pulse_num>,<pp_freq(1)>,<pp_freq(2)>,...<pp_freq(n)>
```

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<pp_freq(n)>::<NRf>` is the pulse-pulse carrier frequency for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`FETCH:PULSE:RESULT:MEASview1:PPFREQUENCY?` might return `0,0.000,1.258E+3,-3.121E+3,1.862E+3` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:PPOWer? (Query Only)

Returns the peak power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:PPOWer?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<pk_power(1)>,<pk_power(2)>,...<pk_power(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<pk_power(n)>::<NRf>` is the peak power for the pulse with the number of [first_pulse_num + n - 1] in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

This measurement gives valid results only for power units(Watts, dBm, dBuW, dBW).

Examples

`FETCH:PULSE:RESULT:MEASview1:PPOWER?` might return `0,-2.26,-2.27,-2.23,-2.25` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:PPPD? (Query Only)

Returns the computed pulse to pulse phase difference from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:PPPD?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<pppd(1)>,<pppd(2),. <pppd(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<pppd(n)>::<NRf> is the pulse to pulse phase difference with the number of [first_pulse_num + n - 1] in Hz.

Examples

FETCH:PULSE[:RESULT]:MEASview1:PPPD? might return 1.0000000000,"-", 96.2469482422, 24.9118175507, 5.8206896782, 16.7037734985, -151.8063964844, 100.7584228516,36.6761512756, -3.8614616394, 12.9028282166, -150.9820556641, 130.5854492188, 9.1259155273, -7.4177660942, 6.0613451004, -142.4224853516 is the number of the first pulse and the pulse to pulse phase difference for each pulse.

FETCh:PULSe[:RESult][:MEASview<y>]:PPPHase? (Query Only)

Returns the pulse-pulse carrier phase in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:PPPHase?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<pp_phase(1)>,<pp_phase(2)>,...<pp_phase(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<pp_phase(n)>::<NRf> is the pulse-pulse carrier phase for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

FETCH:PULSE:RESULT:MEASview1:PPPHASE? might return 0,0.000,21.66,46.76,57.56 for Pulse 0 to 3.

FETCh:PULSe[:RESult]:MEASview<y>:RINTerval? (Query Only)

Returns the repetition interval in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult]:MEASview<y>:RINTerval?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<rep_int(1)>,<rep_int(2)>,...<rep_int(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<rep_int(n)>::<NRf>` is the repetition interval for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`FETCH:PULSE:RESULT:MEASview1:RINTERVAL?` might return `0,16.03E-6,16.08E-6,16.07E-6,16.02E-6` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:RIPDb? (Query Only)

Returns the ripple in dB in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:RIPDb?`

Related Commands

FETCh:PULSe[:RESult][:MEASview<y>]:RIPPle? (on page 1377)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<ripple(1)>,<ripple(2)>,...<ripple(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<ripple(n)>::<NRf>` is the ripple for the pulse with the number of [first_pulse_num + n – 1] in dB.

Examples

`FETCH:PULSE:RESULT:MEASview1:RIPDB?` might return 1,0.4,0.32,0.2,0.1 for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:RIPPle? (Query Only)

Returns the ripple in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:RIPPle?`

Related Commands

FETCh:PULSe[:RESult][:MEASview<y>]:RIPDb? (on page 1376)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<ripple(1)>,<ripple(2)>,...<ripple(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<ripple(n)>::<NRf>` is the volts or watts ripple for the pulse with the number of [first_pulse_num + n - 1] in percent (%).

Examples

`FETCH:PULSE:RESULT:MEASview1:RIPPLE?` might return `0,106.5E-3,177.6E-3, 148.3E-3,148.5E-3` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:RISE? (Query Only)

Returns the rise time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:RISE?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<rise(1)>,<rise(2)>,...<rise(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<rise(n)>::<NRf> is the rise time for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

FETCH:PULSE:RESULT:MEASview1:RISE? might return 0,92.94E-9,115.9E-9, 115.1E-9,97.45E-9 for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:RMSFreqerror? (Query Only)

Returns the RMS frequency error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

FETCh:PULSe[:RESult][:MEASview<y>]:RMSFreqerror?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<RMS_freq_err(1)>,<RMS_freq_err(2)>,...<RMS_freq_err(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<RMS_freq_err(n)>::<NRf> is the RMS frequency error for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

FETCH:PULSE:RESULT:MEASview1:RMSFREQERROR? might return 1,51.54E+3, 69.20E+3,64.21E+3,51.02E+3 for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:RMSPherror? (Query Only)

Returns the RMS phase error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:RMSPherror?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<RMS_phase_err(1)>,<RMS_phase_err(2)>,...<RMS_phase_err(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<RMS_phase_err(n)>::<NRf>` is the RMS phase error for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

`FETCH:PULSE:RESULT:MEASview1:RMSPHERROR?` might return `1,908.4E-3,752.8E-3,981.7E-3,886.4E-3` for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:RRATe? (Query Only)

Returns the repetition rate in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:RRATe?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<rep_rate(1)>,<rep_rate(2)>,...<rep_rate(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<rep_rate(n)>::<NRf>` is the repetition rate for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`FETCH:PULSE:RESULT:MEASview1:RRATE?` might return `0,62.50E+3,62.52E+3, 62.51E+3,62.49E+3` for Pulse 0 to 3.

FETCh:PULSe[:RESult][:MEASview<y>]:TIME? (Query Only)

Returns the time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:TIME?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<time(1)>,<time(2)>,...<time(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<time(n)>::<NRf>` is the time for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`FETCH:PULSE:RESULT:MEASview1:TIME?` might return `1,7.937E-3,8.436E-3, 6.504E-3,9.876E-3` for Pulse 1 to 4.

FETCh:PULSe[:RESult][:MEASview<y>]:WIDTh? (Query Only)

Returns the pulse width in the pulse table.

Conditions

Measurement views: Pulse table

Group

Fetch commands

Syntax

`FETCh:PULSe[:RESult][:MEASview<y>]:WIDTh?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<width(1)>,<width(2)>,...<width(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<width(n)>::<NRf>` is the pulse width for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

FETCH:PULSE:RESULT:MEASview1:WIDTH? might return 0,4.630E-6,4.632E-6, 4.639E-6,4.642E-6 for Pulse 0 to 3.

FETCH:PULSe:STATistics[:MEASview<y>]:ADVanced (Query Only)

Returns the Pulse Count, Max, Max at Pulse number, Min, Min at Pulse number, Peak to Peak, Average and Standard Deviation values for the chosen measurement in Pulse Statistics display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCH:PULSe:STATistics[:MEASview<y>]:ADVanced? <arg1>,<arg2>

Arguments

<arg1>= {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror | MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude|TIME | IRTime | PPPD| PPFD | FABS}

<arg2>={TPCOunt|MAX|MIN|PK2PK|AVG|SD|ALL}

Returns

<puls_cnt> | <max> | <min> | <pk_pk> | <avg> | <std_dev> | <all> For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>:: <NRf> is the average power transmitted

<width> is the time from the rising edge to the falling edge at the –3 dB/–6 dB level (50%) of the user selected 100% level

<rise> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set

Examples

FETCH:PULSE:STATISTICS:MEASview1:ADVANCED RISE, MAX might return 7.9786177665E-9,"-", indicating the maximum rise value is 7.9786177665E-9.

FETCh:PULSe:STATistics[:MEASview<y>]:ATX (Query Only)

Returns the average transmitted power in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:ATX?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<ATX_avg>,<ATX_min>,<ATX_max>

Where

<ATX_avg>::<NRf> is the average of the average transmitted power.

<ATX_min>::<NRf> is the minimum of the average transmitted power.

<ATX_max>::<NRf> is the maximum of the average transmitted power. Unit: dBm.

The unit can be changed to Watts by the [SENSe]:POWer:UNITs command. Volt is invalid in the average transmitted power measurement.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:ATX? might return -18.51,-18.74,-18.12 for the average transmitted power in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:AVERage (Query Only)

Returns the average on power in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:AVERage?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<avg_avg>,<avg_min>,<avg_max>

Where

<avg_avg>::<NRf> is the average of the average on power.

<avg_min>::<NRf> is the minimum of the average on power.

<avg_max>::<NRf> is the maximum of the average on power. Unit: dBm.

The unit can be changed to watts by the [SENSe]:POWer:UNITs command.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:AVERage? might return -2.35,-2.36,-2.34 for the average on power in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:DRODb (Query Only)

Returns the droop in dB in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:DRODb?`

Related Commands

FETCh:PULSe:STATistics[:MEASview<y>]:DROop? (on page 1384)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<droop_avg>,<droop_min>,<droop_max>`

Where

`<droop_avg>::<NRf>` is the average droop.

`<droop_min>::<NRf>` is the minimum droop.

`<droop_max>::<NRf>` is the maximum droop. Unit: in dB.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:DRODb?` might return `22.67E-3,-613.5E-3, 633.8E-3` for the droop in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:DROop (Query Only)

Returns the droop in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:DROop?`

Related Commands

FETCh:PULSe:STATistics[:MEASview<y>]:DRODb? (on page 1383)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<droop_avg>,<droop_min>,<droop_max>`

Where

<droop_avg>::<NRf> is the average droop.

<droop_min>::<NRf> is the minimum droop.

<droop_max>::<NRf> is the maximum droop. Unit: Percent (%) by watts.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:DROop? might return 22.67E-3,-613.5E-3, 633.8E-3 for the droop in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:DUTPct (Query Only)

Returns the duty factor (%) in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:DUTPct?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<duty_pct_avg>,<duty_pct_min)>,<duty_pct_max>

Where

<duty_pct_avg>::<NRf> is the average duty factor.

<duty_pct_min>::<NRf> is the minimum duty factor.

<duty_pct_max>::<NRf> is the maximum duty factor. Unit: Percent (%).

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:DUTPct? might return 2.437,2.310,2.657 for the duty factor (%) in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:DUTRatio (Query Only)

Returns the duty factor (ratio) in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:DUTRatio?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<duty_ratio_avg>,<duty_ratio_min>,<duty_ratio_max)>

Where

<duty_ratio_avg>::<NRf> is the average duty factor.

<duty_ratio_min>::<NRf> is the minimum duty factor.

<duty_ratio_max>::<NRf> is the maximum duty factor. Unit: None.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:DUTRATIO? might return 24.37E-3,23.11E-3, 26.57E-3 for the duty factor (ratio) in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:FABS (Query Only)

Returns the absolute frequency in the Pulse Statistics display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:FABS?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:FABS? might return 99.9846400000E+6, 99.9846400000E+6, 99.9846400000E+6, indicating the absolute frequency value.

FETCh:PULSe:STATistics[:MEASview<y>]:FALL (Query Only)

Returns the fall time in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:FALL?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<fall_avg>,<fall_min>,<fall_max>`

Where

`<fall_avg>::<NRf>` is the average fall time.

`<fall_min>::<NRf>` is the minimum fall time.

`<fall_max>::<NRf>` is the maximum fall time. Unit: Seconds.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:FALL?` might return `70.27E-9,69.62E-9, 71.27E-9` for the fall time in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:FDELta (Query Only)

Return the delta frequency in the pulse statistics.

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:FDELta?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<freq_delta_avg>,<freq_delta_min>,<freq_delta_max>`

Where

`<freq_delta_avg>::<NRf>` is the average frequency deviation.

`<freq_delta_min>::<NRf>` is the minimum frequency deviation.

`<freq_delta_max>::<NRf>` is the maximum frequency deviation. Unit: Hz.

Examples

`FETCh:PULSe:STATistics:MEASview1:FDELta?` might return `77.9785690308,-110.1940994263,287.8957519531` for the frequency delta in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:FRDeviation (Query Only)

Returns the frequency deviation in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

```
FETCh:PULSe:STATistics[:MEASview<y>]:FRDeviation?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<freq_dev_avg>,<freq_dev_min>,<freq_dev_max>`

Where

`<freq_dev_avg>::<NRf>` is the average frequency deviation.

`<freq_dev_min>::<NRf>` is the minimum frequency deviation.

`<freq_dev_max>::<NRf>` is the maximum frequency deviation. Unit: Hz.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:FRDEVIATION?` might return `754.1E+3, 660.5E+3,835.2E+3` for the frequency deviation in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:IRAMplitude (Query Only)

Returns the Pulse Impulse Response Amplitude measurement in the pulse statistics.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

```
FETCh:PULSe:STATistics[:MEASview<y>]:IRAMplitude?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<amp_avg>,<amp_min>,<amp_max>`

Where

<amp_avg>::<NRf> is the average of the impulse response amplitude.

<amp_min>::<NRf> is the minimum of the impulse response amplitude.

<amp_max>::<NRf> is the maximum of impulse response amplitude. Unit: dB.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:IRAMPLITUDE? might return -45.3,-47.1,-43.2 for the impulse response amplitude in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:IRTime (Query Only)

Returns the impulse response time in the pulse statistics.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:IRTime?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<avg_avg>,<avg_min>,<avg_max>

Where

<avg_avg>::<NRf> is the average of the impulse response time.

<avg_min>::<NRf> is the minimum of the impulse response time.

<avg_max>::<NRf> is the maximum of impulse response time. Unit: seconds.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:IRTime? might return -2.35,-2.36,-2.34 for the impulse response time in the pulse statistics.

FETCH:PULSe:STATistics[:MEASview<y>]:MAX:PULSe:NUMber (Query Only)

Returns the maximum value at a certain pulse number in the pulse statistics display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCH:PULSe:STATistics[:MEASview<y>]:MAX:PULSe:NUMber?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<max_pulse_no>

Where

<max_pulse_no>::<NRf> is the maximum value at a pulse number.

Examples

FETCH:PULSE:STATISTICS:MEASview2:MAX:PULSE:NUMBER? might return 15 for the maximum pulse number is 15.

FETCh:PULSe:STATistics[:MEASview<y>]:MFReqerror (Query Only)

Returns the maximum frequency error in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:MFReqerror?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<max_freq_err_avg>,<max_freq_err_min>,<max_freq_err_max>

Where

<max_freq_err_avg>::<NRf> is the average of maximum frequency error.

<max_freq_err_min>::<NRf> is the minimum of maximum frequency error.

<max_freq_err_max>::<NRf> is the maximum of maximum frequency error. Unit: Hz.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:MFReqerror? might return 645.0E+3,555.6E+3,738.8E+3 for the maximum frequency error in the pulse statistics.

FETCH:PULSe:STATistics[:MEASview<y>]:MIN:PULSe:NUMber (Query Only)

Returns the minimum value at a certain pulse number in the pulse statistics.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number.

Group

Fetch commands

Syntax

`FETCH:PULSe:STATistics[:MEASview<y>]:MIN:PULSe:NUMber?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<min_pulse_no>`

Where

`<min_pulse_no>::<NRf>` is the minimum value at a pulse number.

Examples

`FETCH:PULSE:STATISTICS:MIN:PULSE:NUMBER?` might return `1` for the minimum pulse number in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:MPHerror (Query Only)

Returns the maximum phase error in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:MPHerror?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<max_phase_err_avg>,<max_phase_err_min>,<max_phase_err_max>`

Where

`<max_phase_err_avg>::<NRf>` is the average of maximum phase error.

`<max_phase_err_min>::<NRf>` is the minimum of maximum phase error.

`<max_phase_err_max>::<NRf>` is the maximum of maximum phase error. Unit: Degrees.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:MPHerror? might return -11.47,-17.18, -7.61 for the maximum phase error in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:OVEDb (Query Only)

Returns the overshoot measurement result in dB in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:OVEDb?

Related Commands

FETCh:PULSe:STATistics[:MEASview<y>]:OVERshoot? (on page 1392)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<overshoot_avg>,<overshoot_min>,<overshoot_max>

Where

<overshoot_avg>::<NRf> is the average overshoot.

<overshoot_min>::<NRf> is the minimum overshoot.

<overshoot_max>::<NRf> is the maximum overshoot.

Unit: dB.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:OVEDb? might return 0.3,0.1,0.5 for the overshoot measurement result in dB in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:OVERshoot (Query Only)

Returns the overshoot in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

```
FETCh:PULSe:STATistics[:MEASview<y>]:OVERshoot?
```

Related Commands

FETCh:PULSe:STATistics[:MEASview<y>]:OVEDb? (on page 1392)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<overshoot_avg>,<overshoot_min>,<overshoot_max>

Where

<overshoot_avg>::<NRf> is the average overshoot.

<overshoot_min>::<NRf> is the minimum overshoot.

<overshoot_max>::<NRf> is the maximum overshoot. Unit: Percent (%) by watts or volts.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:OVERshoot? might return 0.3,0.1,0.5 for the overshoot in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:PHDeviation (Query Only)

Returns the phase deviation in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

```
FETCh:PULSe:STATistics[:MEASview<y>]:PHDeviation?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<phase_dev_avg>,<phase_dev_min>,<phase_dev_max>

Where

<phase_dev_avg>::<NRf> is the average phase deviation.

<phase_dev_min>::<NRf> is the minimum phase deviation.

<phase_dev_max>::<NRf> is the maximum phase deviation. Unit: Degrees.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:PHDeviation? might return 11.678,7.694, 17.374 for the phase deviation in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:PPFD (Query Only)

Returns the pulse-pulse frequency difference in the Pulse Statistics display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:PPFD?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:PPFD? might return 365.4186562500E+3, -267.5911040000E+6, 247.1117760000E+6, indicating the pulse-pulse frequency difference.

FETCh:PULSe:STATistics[:MEASview<y>]:PPFRequency (Query Only)

Returns the pulse-pulse carrier frequency in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:PPFRequency?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<pp_freq_avg>,<pp_freq_min)>,<pp_freq_max>

Where

<pp_freq_avg>::<NRf> is the average pulse-pulse carrier frequency.

<pp_freq_min>::<NRf> is the minimum pulse-pulse carrier frequency.

<pp_freq_max>::<NRf> is the maximum pulse-pulse carrier frequency. Unit: Hz.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:PPFRequency? might return 1.135E+3,311.3E+3,-262.8E+3 for the pulse-pulse carrier frequency in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:PPOWer (Query Only)

Returns the peak power in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:PPOWer?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<pk_power_avg>,<pk_power_min>,<pk_power_max>

Where

<pk_power_avg>::<NRf> is the average peak power.

<pk_power_min>::<NRf> is the minimum peak power.

<pk_power_max>::<NRf> is the maximum peak power. Unit: dBm.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

FETCh:PULSe:STATistics:MEASview2:PPOWer? might return -2.273,-2.313,-2.235 for the peak power in the pulse statistics 2.

FETCh:PULSe:STATistics[:MEASview<y>]:PPPD (Query Only)

Returns the overshoot measurement result in dB in the Pulse Statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:PPPD?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

`FETCh:PULSe:STATistics:MEASview2:PPPD?` might return `-1.1131216288, -151.8063964844, 130.5854492188`, indicating the pulse-pulse phase difference in dB.

FETCh:PULSe:STATistics[:MEASview<y>]:PPPHase (Query Only)

Returns the pulse-pulse carrier phase in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd` or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:PPPHase?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<pp_phase_avg>,<pp_phase_min)>,<pp_phase_max>`

Where

`<pp_phase_avg>::<NRf>` is the average pulse-pulse carrier phase.

`<pp_phase_min>::<NRf>` is the minimum pulse-pulse carrier phase.

`<pp_phase_max>::<NRf>` is the maximum pulse-pulse carrier phase. Unit: Degrees.

Examples

`FETCh:PULSe:STATistics:MEASview2:PPPHase?` might return `-9.298E-3,-254.3E-3,311.7E-3` for the pulse-pulse carrier phase in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:RINTerval (Query Only)

Returns the repetition interval in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:RINTerval?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<rep_int_avg>,<rep_int_min>,<rep_int_max>`

Where

`<rep_int_avg>::<NRf>` is the average repetition interval.

`<rep_int_min>::<NRf>` is the minimum repetition interval.

`<rep_int_max>::<NRf>` is the maximum repetition interval.

Unit: Seconds.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:RINTERVAL` might return `240.5E-6,217.9E-6,281.2E-6` for the repetition interval in the pulse statistics 2.

FETCh:PULSe:STATistics[:MEASview<y>]:RIPDb (Query Only)

Returns the ripple in dB in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:RIPDb?`

Related Commands

FETCh:PULSe:STATistics[:MEASview<y>]:RIPPle? (on page 1398)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<ripple_avg>,<ripple_min>,<ripple_max>`

Where

<ripple_avg>::<NRf> is the average ripple.

<ripple_min>::<NRf> is the minimum ripple.

<ripple_max>::<NRf> is the maximum ripple.

Unit: dB.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:RIPDb? might return 160.4E-3,83.78E-3,287.7E-3 for the ripple in dB in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:RIPPle (Query Only)

Returns the ripple in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:RIPPle?

Related Commands

FETCh:PULSe:STATistics[:MEASview<y>]:RIPDb? (on page 1397)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<ripple_avg>,<ripple_min>,<ripple_max>

Where

<ripple_avg>::<NRf> is the average ripple.

<ripple_min>::<NRf> is the minimum ripple.

<ripple_max>::<NRf> is the maximum ripple. Unit: Percent (%) by watts or volts.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:RIPPle? might return 160.4E-3,83.78E-3,287.7E-3 for the ripple in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:RISE (Query Only)

Returns the rise time in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:RISE?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<rise_avg>,<rise_min>,<rise_max>`

Where

`<rise_avg>::<NRf>` is the average rise time.

`<rise_min>::<NRf>` is the minimum rise time.

`<rise_max>::<NRf>` is the maximum rise time. Unit: Seconds.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:RISE?` might return `105.4E-9,91.65E-9, 116.2E-9` for the rise time in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:RMSFreqerror (Query Only)

Returns the RMS frequency error in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:RMSFreqerror?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<RMS_freq_err_avg>,<RMS_freq_err_min>,<RMS_freq_err_max>`

Where

`<RMS_freq_err_avg>::<NRf>` is the average of RMS frequency error.

`<RMS_freq_err_min>::<NRf>` is the minimum of RMS frequency error.

`<RMS_freq_err_max>::<NRf>` is the maximum of RMS frequency error. Unit: Hz.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:RMSFreqerror?` might return `63.67E+3, 45.49E+3,81.28E+3` for the RMS frequency error in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:RMSPherror (Query Only)

Returns the RMS phase error in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:RMSPherror?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<RMS_phase_err_avg>,<RMS_phase_err_min>,<RMS_phase_err_max>`

Where

`<RMS_phase_err_avg>::<NRf>` is the average of RMS phase error.

`<RMS_phase_err_min>::<NRf>` is the minimum of RMS phase error.

`<RMS_phase_err_max>::<NRf>` is the maximum of RMS phase error. Unit: Degrees.

Examples

`FETCH:PULSE:STATISTICS:MEASVIEW2:RMSPHERROR?` might return `1.032,604.5E-3, 1.606` for the RMS phase error in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:RRATe (Query Only)

Returns the repetition rate in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:STATistics[:MEASview<y>]:RRATe?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<rep_rate_avg>,<rep_rate_min>,<rep_rate_max>

Where

<rep_rate_avg>::<NRf> is the average repetition rate.

<rep_rate_min>::<NRf> is the minimum repetition rate.

<rep_rate_max>::<NRf> is the maximum repetition rate. Unit: Hz.

Examples

FETCh:PULSe:STATistics[:MEASview<y>]:RRATe? might return 62.50E+3,62.49E+3, 62.52E+3 for the repetition rate in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:WIDTh (Query Only)

Returns the pulse width in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:WIDTh?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<width_avg>,<width_min>,<width_max>

Where

<width_avg>::<NRf> is the average pulse width.

<width_min>::<NRf> is the minimum pulse width.

<width_max>::<NRf> is the maximum pulse width. Unit: Seconds.

Examples

FETCh:PULSe:STATistics[:MEASview<y>]:WIDTh? might return 4.636E-6,4.630E-6, 4.643E-6 for the pulse width in the pulse statistics.

FETCh:PULSe:STATistics[:MEASview<y>]:X? (Query Only)

Returns the horizontal values of the trace data of the Pulse Statistics measurement selected by the DISPlay:PULSe:SELect:RESult command.

NOTE: Select the plot type (Trend, FFT, Time Trend or Histogram) using the DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT command before executing this query.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:X?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><data1><data2>...data<n>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the horizontal value of the STATistics:MEASview<y> graph at the nth data point.

The unit is trace number (Plot = Trend), Hz (Plot = FFT), second (Plot = Time Trend) or current measurement unit (Plot = Histogram).

4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCh:PULSe:STATistics:MEASview2:X? might return #264xxxx. (64-byte data) for the STATistics:MEASview2 trace of the pulse width measurement when DISPlay:PULSe:SELect: RESult is set to WIDTh.

FETCh:PULSe:STATistics[:MEASview<y>]:XY? (Query Only)

Returns the horizontal and vertical values of the trace data of the pulse statistics measurement selected by the DISPlay:PULSe:SELect:RESult command.

NOTE: Select the plot type (Trend, FFT, Time Trend or Histogram) using the DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT command before executing this query.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>]:XY?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><data1><data2>...data<n>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the horizontal value of the STATistics:MEASview<y> graph at the nth data point.

<data(n+1)> is the vertical value of the STATistics:MEASview<y> graph at the nth data point.

For horizontal values, the unit is trace number (Plot = Trend), Hz (Plot = FFT), second (Plot = Time Trend) or current measurement unit (Plot = Histogram).

For vertical values, the unit is current measurement unit (Plot = Trend or Time Trend), dB (Plot = FFT), count (Plot = Histogram)

4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCh:PULSe:STATistics:MEASview1:XY? might return #264xxxx... (64-byte data) for the STATistics:MEASview1 trace of the pulse width measurement when DISPlay:PULSe:SELect: RESult is set to WIDTh.

FETCh:PULSe:STATistics[:MEASview<y>][:Y]? (Query Only)

Returns the trace data of the pulse statistics measurement selected by the DISPlay:PULSe:SELect:RESult command.

NOTE: Select the plot type (Trend, FFT, Time Trend or Histogram) using the DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT command before executing this query.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:STATistics[:MEASview<y>][:Y]?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the amplitude at the nth data point.

The unit is current measurement unit (Plot = Trend or Time Trend), dB (Plot = FFT), count or percent (Plot = Histogram)

4-byte little endian floating-point format specified in IEEE 488.2.

The unit of power is selected by the [SENSe]:POWer:UNITs command.

Examples

FETCH:PULSE:STATISTICS:MEASVIEW2:Y? might return #264xxxx... (64-byte data) for the STATistics 2 trace of the pulse width measurement when DISPlay:PULSe:SELect:RESult is set to WIDTh.

FETCh:PULSe:TRACe[:MEASview<y>]:X

Returns the time values of the pulse trace. Use the DISPlay:PULSe:SELect:NUMBer command to select the pulse, and the DISPlay:PULSe:SELect:RESult command to select the measurement result.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:PULSe:TRACe[:MEASview<y>]:X?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><X(1)><X(2)>...<X(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<X(n)> is the time in seconds at the nth data point,

4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:PULSE:TRACE:MEASVIEW1:X? might return #43204xxxx... (3204-byte data) for the time values of the trace in pulse trace measurement view 1.

FETCh:PULSe:TRACe[:MEASview<y>]:XY

Returns the horizontal (time) and vertical value pairs of the pulse trace. Use the DISPlay:PULSe:SELect:NUMBer command to select the pulse, and the DISPlay:PULSe:SELect:RESult command to select the measurement result.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:TRACe[:MEASview<y>]:XY?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)><y(n)>` is the horizontal value (time in seconds) and vertical value pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The vertical unit depends on measurement results: Hz for frequency error and deviation, degrees for phase error and deviation, otherwise dBm. The vertical unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:PULSE:TRACE:MEASVIEW1:XY?` might return `#43204xxxx...` (3204-byte data) for the horizontal (time) and vertical value pairs of the pulse trace measurement view 1.

.

FETCh:PULSe:TRACe[:MEASview<y>]:Y

Returns the vertical values of the pulse trace. Use the `DISPlay:PULSe:SELect:NUMBer` command to select the pulse, and the `DISPlay:PULSe:SELect:RESult` command to select the measurement result.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Fetch commands

Syntax

`FETCh:PULSe:TRACe[:MEASview<y>]:Y?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

<y(n)> is the amplitude (dBm) at the nth data point,

4-byte little endian floating-point format specified in IEEE 488.2.

The unit depends on measurement results: Hz for frequency error and deviation, degrees for phase error and deviation, otherwise dBm. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

FETCH:PULSE:TRACE:MEASVIEW1:Y? might return #43204xxxx... (3204-byte data) for the vertical values of the pulse trace measurement view 1.

FETCh:RFIN:IQ? (Query Only)

Returns time-domain IQ data for a specific acquisition data record. You can set a range of IQ pairs optionally. The instrument needs to be in stopped mode. If not in stopped mode, it returns the execution error (-200).

Conditions

Measurement views: All

Group

Fetch commands

Syntax

FETCh:RFIN:IQ? <rec_ID>[,<begin_num>,<end_num>]

Arguments

<rec_ID> specifies the acquisition data record ID number.

<begin_num> specifies the beginning number of IQ pairs.

<end_num> specifies the end number of IQ pairs.

Use the FETCh:RFIN:RECord:IDS? query to get the beginning and end ID's of acquisition data records.

Returns

#<num_digit><num_byte><I(1)><Q(1)><I(2)><Q(2)>...<I(n)><Q(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<I(n)> and <Q(n)> are the time-domain IQ data pair.

4-byte little endian floating-point format specified in IEEE 488.2.

To find out the range of IQ pairs, use the FETCh:RFIN:IQ:HEADer? query. The returned value of <num_sample> is the number of IQ pairs.

NOTE: Do not fetch a large number of IQ pairs because of memory limitation.

Examples

FETCH:RFIN:IQ? 10,25,350 might return #43848xxxx... (3848-byte data) for the record #10, ranging from 25th to 350th IQ pair.

FETCh:RFIN:IQ:HEADer? (Query Only)

Returns the header information for a specific acquisition data record. The instrument needs to be in stopped mode. If not in stopped mode, it returns the execution error (-200).

Conditions

Measurement views: All

Group

Fetch commands

Syntax

`FETCh:RFIN:IQ:HEADer? <rec_ID>`

Arguments

`<rec_ID>` specifies the acquisition data record ID number.

Use the `FETCh:RFIN:RECord:IDS?` query to get the beginning and end ID's of acquisition data records.

Returns

`<span>,<sampling_freq>,<num_sample>,<center_freq>,<acq_BW>,`
`<ref_level>,<trig_pos>,<time_stamp>,<FastFrame_ID>`

Where

`<span>::<NR3>` is the span in Hz.

`<sampling_freq>::<NR3>` is the sampling frequency in Hz.

`<num_sample>::<NR3>` is the number of samples.

`<center_freq>::<NR3>` is the center frequency in Hz.

`<acq_BW>::<NR3>` is the acquisition bandwidth in Hz.

`<ref_level>::<NR3>` is the reference level in dBm.

`<trig_pos>::<NR3>` is the trigger position in seconds.

`<time_stamp>::<string>` is the time stamp.

`<FastFrame_ID>::<NR1>` is the Fast Frame ID: Zero or positive number. If the Fast Frame is disabled, the ID will be negative.

Examples

`FETCH:RFIN:IQ:HEADER? 10` might return `40.0E+6,50.0E+6,4.027E+3,`
`1.5E+9,40.0E+6,0.0,20.242E-6,"10/31/2007 1118:32 AM",-1`, indicating Span: 40 MHz, Sampling frequency: 50 MHz, Number of samples: 4027, Center frequency: 1.5 GHz, Acquisition bandwidth: 40 MHz, Reference level: 0 dBm, Trigger position: 20.242 µs, Time stamp: 10/31/2007 1118:32 AM, and Fast Frame ID: -1.

FETCh:RFIN:IQ:SCALe? (Query Only)

Returns the internal RF linear data scaling factor contained in the .tiq file header. The scaling factor can be used to convert digital IQ output (Option 05) values into real IQ values.

Conditions

Measurement views: All

Group

Fetch commands

Syntax

`FETCh:RFIN:IQ:SCALe?`

Related Commands

FETCh:RFIN:RECord:IDS? (on page 1409)

Arguments

None

Returns

`<NR3>` The RF linear data scaling factor.

Examples

`FETCH:RFIN:IQ:SCALE?` might return `19.553E-6` for the scaling factor.

FETCh:RFIN:IQ:VHEader? (Query Only)

Returns the verbose header information for a specific acquisition data record. The instrument needs to be in stopped mode. If not in stopped mode, it returns the execution error (-200).

Conditions

Measurement views: All

Group

Fetch commands

Syntax

`FETCh:RFIN:IQ:VHEader? <rec_ID>`

Arguments

`<rec_ID>` specifies the acquisition data record ID number.

Use the `FETCh:RFIN:RECord:IDS?` query to get the beginning and end ID's of acquisition data records.

Returns

```
<span>,<sampling_freq>,<num_sample>,<center_freq>,<acq_BW>,
<ref_level>,<trig_pos>,<time_stamp>,<FastFrame_ID>
```

Where

`<span>::<NR3>` is the span in Hz.

`<sampling_freq>::<NR3>` is the sampling frequency in Hz.

`<num_sample>::<NR3>` is the number of samples.

`<center_freq>::<NR3>` is the center frequency in Hz.

`<acq_BW>::<NR3>` is the acquisition bandwidth in Hz.

`<ref_level>::<NR3>` is the reference level in dBm.

`<trig_pos>::<NR3>` is the trigger position in seconds.

<time_stamp>::<string> is the time stamp.

<FastFrame_ID>::<NR1> is the Fast Frame ID: Zero or positive number. If the Fast Frame is disabled, the ID will be negative.

Examples

FETCH:RFIN:IQ:VHEADER? 10 might return 110.0000000000E+6,150.0000000000E+6,4.0270000000E+3, 2.7000000000E+9,110.0000000000E+6,0.0000,20.2420000000E-6, "7/9/2013 8:38:25.9305101 -07:00:00",-1, indicating Span: 110 MHz, Sampling frequency: 150 MHz, Number of samples: 4027, Center frequency: 2.7 GHz, Acquisition bandwidth: 110 MHz, Reference level: 0 dBm, Trigger position: 20.242 µs, Time stamp: 10/31/2007 1118:32 AM, Fast Frame ID: -1

FETCh:RFIN:RECord:IDS? (Query Only)

Returns the beginning and end ID numbers of acquisition data.

NOTE: The instrument needs to be in stopped mode. If not in stopped mode, it returns the execution error (-200).

Conditions

Measurement views: All

Group

Fetch commands

Syntax

FETCh:RFIN:RECord:IDS?

Arguments

None

Returns

<begin_ID>,<end_ID>

Where

<begin_ID>::<NR1> is the beginning ID of acquisition data.

<end_ID>::<NR1> is the end ID of acquisition data.

NOTE: "-1,-1" is returned when the span changes and the acquisition is armed, but the acquisition has not yet occurred.

Examples

FETCH:RFIN:RECORD:IDS? might return 1,147, indicating the beginning and end IDs of acquisition data are 1 and 147, respectively.

FETCh:SEM:MHITs:COUNt? (Query Only)

Returns the number of rows in the results table in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

`FETCh:SEM:MHITs:COUNt?`

Arguments

None

Returns

`<NRf>` The number of rows in the table.

Examples

`FETCH:SEM:MHITS:COUNT?` might return `7`, indicating there are seven rows in the results table.

FETCh:SEM:MHITs<x>:AMPLitude:ABSolute? (Query Only)

Returns the absolute amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

`FETCh:SEM:MHITs<x>:AMPLitude:ABSolute?`

Arguments

None

Returns

`<NRf>` Absolute amplitude of the specified signal in dBm.

`<x>` specifies the row in the results table, where the range is from 1 to 12.

Examples

`FETCh:SEM:MHITs2:AMPLitude:ABSolute?` might return `-73.17`, indicating that the absolute amplitude of signal in row 2 is –73.17 dBm.

FETCh:SEM:MHITs<x>:AMPLitude:RELative? (Query Only)

Returns the relative amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

`FETCh:SEM:MHITs<x>:AMPLitude:RELative?`

Arguments

None

Returns

`<NRf>` Relative amplitude of the specified signal in dBm.

`<x>` specifies the row in the results table, where the range is from 1 to 12.

Examples

`FETCh:SEM:MHITs2:AMPLitude:RELative?` might return `-91.81`, indicating that the relative amplitude of mask hit signal in row 2 is –91.81 dBm.

FETCh:SEM:MHITs<x>:FREQuency? (Query Only)

Returns the frequency of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

`FETCh:SEM:MHITs<x>:FREQuency?`

Arguments

None

Returns

`<NRf>` Relative amplitude of the specified signal in dBm.

`<x>` specifies the row in the results table, where the range is from 1 to 12.

Examples

`FETCh:SEM:MHITs4:FREQuency?` might return `2.235E+6`, indicating the frequency for mask hit signal in row 4 is 2.235 MHz.

FETCh:SEM:MHITs<x>:INTeg:ABSolute? (Query Only)

Returns the absolute integration amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:MHITs<x>:INTeg:ABSolute?

Arguments

None

Returns

<NRf> Absolute integration amplitude of the specified signal in dBm.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

FETCh:SEM:MHITs4:INTeg:ABSolute? might return –75.14, indicating that the absolute integration amplitude for mask hit signal in row 4 is -75.14 dBM.

FETCh:SEM:MHITs<x>:INTeg:RELative? (Query Only)

Returns the relative integration amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:MHITs<x>:INTeg:RELative?

Arguments

None

Returns

<NRf> Relative integration amplitude of the specified signal in dBm.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

FETCh:SEM:MHITs4:INTeg:RELative? might return –85.14, indicating that the relative integration amplitude for mask hit signal in row 4 is –85.14 dBM.

FETCh:SEM:MHITs<x>:MARGin:ABSolute? (Query Only)

Returns the absolute margin for the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:MHITs<x>:MARGin:ABSolute?

Arguments

None

Returns

<NRf> Absolute margin of the specified signal in dB.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

FETCh:SEM:MHITs4:MARGin:ABSolute? might return -62.33, indicating that the absolute margin for mask hit signal in row 4 is –62.33 dB.

FETCh:SEM:MHITs<x>:MARGin:RELative? (Query Only)

Returns the relative margin for the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:MHITs<x>:MARGin:RELative?

Arguments

None

Returns

<NRf> Relative margin of the specified signal in dB.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

FETCh:SEM:MHITs4:MARGin:RELative? might return -62.33, indicating that the relative margin for mask hit signal in row 4 is –62.33 .

FETCh:SEM:MHITs<x>:OFFSet? (Query Only)

Returns the offset for the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:MHITs<x>:OFFSet?

Arguments

None

Returns

<NRf> specifies the mask hit offset.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

FETCh:SEM:MHITs4:OFFSet? might return BL, indicating the offset for mask hit signal in row 4 is BL.

FETCh:SEM:PASS? (Query Only)

Returns the pass/fail limit test result in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:PASS?

Arguments

None

Returns

0 (fail) or 1 (pass)

Examples

FETCH:SEM:PASS? might return 1, indicating that the limit test was successful.

FETCh:SEM:REF:POWer? (Query Only)

Returns the reference power level in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:REF:POWer?

Arguments

None

Returns

<NRf> specifies the reference power.

Examples

`FETCH:SEM:REF:POWER?` might return `-16.92 dBm`, indicating that the reference power level is –16.92 dBm.

FETCh:SEM:SPECtrum:X? (Query Only)

Returns the frequencies of the spectrum trace in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

`FETCh:SEM:SPECtrum:X?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)>` is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:SEM:SPECTRUM:X?` might return `#516020xxxx...` (16020-byte data) for the frequencies of the spectrum trace.

FETCh:SEM:SPECtrum:XY? (Query Only)

Returns the frequency and amplitude pairs of the spectrum trace in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

`FETCh:SEM:SPECtrum:XY?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)><y(n)> is the frequency (Hz) and amplitude (dBm) pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:SEM:SPECTRUM:XY? might return #516020xxxx... (16020-byte data) for the frequency and amplitude pairs of the spectrum trace.

FETCh:SEM:SPECtrum[:Y]? (Query Only)

Returns the amplitude of the spectrum trace in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Fetch commands

Syntax

FETCh:SEM:SPECtrum[:Y]?

Arguments

None

Returns

#<num_digit><num_byte><x(1)><x(2)>...<x(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)> is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:SEM:SPECTRUM[:Y]? might return #516020xxxx... (16020-byte data) for the frequencies of the spectrum trace.

FETCh:SGRam[:MEASview<y>](Query Only)

Returns trace data of a line in the spectrogram. The line is selected using the TRACe:SGRam[:MEASview<y>]:SELect:LINE command.

Conditions

Measurement views: Spectrogram

Group

Fetch commands

Syntax

FETCh:SGRam[:MEASview<y>]?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude in dBm at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCh:SGRam:MEASview1?` might return `#43204xxxx...` (3204-byte data) for the line in the spectrogram.

FETCh:SIGNalvu:ACQuisition:COUPling? (Query Only)

Returns the coupling value of the acquisition.

Conditions

Should be connected to MSO Query

Group

Fetch commands

Syntax

`FETCh:SIGNalvu:ACQuisition:COUPling?`

Arguments

None

Returns

`<max>::<NRf>` is the maximum phase in degrees.

Examples

`FETCh:SIGNalvu:ACQuisition:COUPling?` might return 153.8, indicating the maximum phase is 153.8 °.

FETCh:SIGNalvu:ACQuisition:MAX:RT:BW? (Query Only)

Queries the maximum real time bandwidth value of the instrument.

Conditions

Should be connected to MSO Query

Group

Fetch commands

Syntax

`FETCh:SIGNalvu:ACQuisition:MAX:RT:BW`

Related Commands

`FETCh:SIGNalvu:ACQuisition:MAX:RT:BW?`

Arguments

None

Returns

`<max>::<NRf>` is the maximum phase in degrees.

Examples

`FETCh:SIGNalvu:ACQuisition:MAX:RT:BW?` might return 153.8, indicating the maximum phase is 153.8 °.

FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:HIGHSide:MAXFreq? (Query only)

Returns the maximum range of input center frequency in case of high injection side. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to query.

Source keyword is optional, if not present Source1 will be default source.

Group

Fetch commands

Syntax

`FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:HIGHSide:MAXFreq?`

Related Commands

:FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:HIGHSide:MINFreq? (on page 1418)

Arguments

None

Returns

`<max>::<NRf>` returns the maximum value of the centre frequency range in case of high injection side.

Examples

`:FETCH:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:INJEction:HIGHSide:MAXFreq?` might return `9.5000000000E+9`, indicating the maximum range of the input center frequency in case of high injection side.

FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:HIGHSide:MINFreq? (Query only)

Returns the minimum range of the input center frequency in case of high injection side. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to query.

Source keyword is optional, if not present, Source1 is default source.

Group

Fetch commands

Syntax

`FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:HIGHSide:MINFreq?`

Arguments

None

Returns

`<max>::<NRf>` returns the minimum value of the center frequency range in case of high injection side.

Examples

`:FETCH:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:INJEction:HIGHSide:MINFreq?` might return `2.0000000000E+9`, indicating the minimum range of the input center frequency in case of high injection side.

FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:LOWSide:MAXFreq? (Query only)

Returns the maximum range of the input center frequency in case of low injection side. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to query.

Source keyword is optional, if not present, Source1 will be default source.

Group

Fetch commands

Syntax

`FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:LOWSide:MAXFreq?`

Related Commands

FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:LOWSide:MINFreq? (on page 1420)

Arguments

None

Returns

`<max>::<NRf>` returns the maximum value of centre frequency range in case of low injection side.

Examples

`:FETCH:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:INJEction:LOWSide:MAXFreq?` Might return `9.5000000000E+9`, indicating the maximum range of the input center frequency in case of low injection side.

FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:LOWSide:MINFreq? (Query only)

Returns the minimum range of input center frequency in case of low injection side. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to query.

Source keyword is optional, if not present, Source1 will be default source

Group

Fetch commands

Syntax
`FETCH:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INJEction:LOWSide:MINFreq?`

Arguments

None

Returns

`<max>::<NRf>` returns the minimum value of the centre frequency range in case of low injection side.

Examples

`:FETCH:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:INJEction:LOWSide:MINFreq?` might return `2.0000000000E+9`, indicating the minimum range of the input center frequency in case of low injection side.

FETCh:SIGNalvu:ACQuisition:TERMination? (Query Only)

Queries the termination value of the acquisition.

Conditions

Should be connected to MSO Query

Group

Fetch commands

Syntax

`FETCh:SIGNalvu:ACQuisition:TERMination?`

Arguments

None

Returns

`<max>::<NRf>` is the maximum phase in degrees.

Examples

`FETCh:SIGNalvu:ACQuisition:TERMination?` might return 153.8, indicating the maximum phase is 153.8 °.

FETCh:SIGNalvu:ACQuisition:MATHchannels

Fetches math inputs available on the oscilloscope.

Conditions

It should be connected to MSO/LPD/DPO7 to set.

Group

Fetch commands

Syntax

`FETCh:SIGNalvu:ACQuisition:MATHchannels`

Related Commands

NA

Arguments

NA

Returns

NA

Example

`FETCh:SIGNalvu:ACQuisition:MATHchannels`, fetches math inputs available on the oscilloscope.

`{{end}}`

FETCh:SPECtrum[:MEASview<y>]:TRACe:BITMap? (Query Only)

Returns trace waveform data of the bitmap trace in the Spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Fetch commands

Syntax

`FETCh:SPECtrum[:MEASview<y>]:TRACe:BITMap?`

Arguments

None

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

A binary block of 32-bit floating point values (IEEE standard single precision floating point format). Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Bitmaps have 201 rows. Data[0] is the first column in the first row, and the following data continues along that row before moving to the next.

Bitmap values are returned in the order of top left pixel first, then the rest of the top row, after that row by row. In other words, the pixels in the bitmap are returned from left to right and top to bottom; one row at a time.

Examples

`FETCH:SPECTRUM:TRACE:BITMAP?` might return #6644004xxxx...

FETCh:SPECtrum[:MEASview<y>]:TRACe<x>? (Query Only)

Returns the trace data in the Spectrum measurement.

The parameter <x> = 1 to 5.

NOTE: TRACe5 (spectrogram) is valid when the spectrum and spectrogram measurements are running.

Conditions

Measurement views: Spectrum

Group

Fetch commands

Syntax

`FETCh:SPECtrum[:MEASview<y>]:TRACe<x>?`

Related Commands

TRACe<x>:SPECtrum (on page 2737)

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude in dBm at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:SPECTRUM:MEASview1:TRACE1?` might return `#43204xxxx...` (3204-byte data) for Trace 1 in the Spectrum measurement.

FETCh:SPURious:CARRier:POWer? (Query Only)

Returns the carrier power in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:CARRier:POWer?`

Arguments

None

Returns

`<NRf>` Carrier power in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:SPURIOUS:CARRIER:POWER?` might return `4.227`, indicating that the carrier power is 4.227 dBm.

FETCh:SPURious:COUNt? (Query Only)

Returns the number of spurious signals in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:COUNt?`

Arguments

None

Returns

`<NRf>` The number of spurious signals.

Examples

`FETCH:SPURIOUS:COUNT?` might return `4`, indicating that the spurious count is 4.

FETCh:SPURious:PASS? (Query Only)

Returns the pass/fail limit test result in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:PASS?`

Arguments

None

Returns

0 (fail) or 1 (pass).

Examples

`FETCH:SPURIOUS:PASS?` might return `1`, indicating that the limit test was successful.

FETCh:SPURious:SPECtrum:X? (Query Only)

Returns the frequencies of the spectrum trace in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPECtrum:X?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)>` is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:SPURIOUS:SPECTRUM:X?` might return `#516020xxxx...` (16020-byte data) for the frequencies of the spectrum trace in the Spurious measurement.

FETCh:SPURious:SPECtrum:XY? (Query Only)

Returns the frequency and amplitude pairs of the spectrum trace in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPECtrum:XY?`

Arguments

None

Returns

#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)><y(n)> is the frequency (Hz) and amplitude (dBm) pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The amplitude unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

FETCH:SPURIOUS:SPECTRUM:XY? might return #516020xxxx... (16020-byte data) for the frequency and amplitude pairs of the spectrum trace in the Spurious measurement.

FETCh:SPURious:SPECtrum[:Y]? (Query Only)

Returns the amplitudes of the spectrum trace in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

FETCh:SPURious:SPECtrum[:Y]?

Arguments

None

Returns

#<num_digit><num_byte><y(1)><y(2)>...<y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<y(n)> is the amplitude (dBm) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

FETCH:SPURIOUS:SPECTRUM:Y? might return #516020xxxx... (16020-byte data) for the amplitudes of the spectrum trace in the Spurious measurement.

FETCh:SPURious:SPUR<x>:AMPLitude:ABSolute? (Query Only)

Returns the absolute amplitude of the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:AMPLitude:ABSolute?`

Arguments

None

Returns

`<NRf>` Absolute amplitude of the specified spurious signal in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:SPURIOUS:SPUR1:AMPLITUDE:ABSOLUTE?` might return `-19.782`, indicating that the absolute amplitude of Spurious #1 is −19.782 dBm.

FETCh:SPURious:SPUR<x>:AMPLitude:RELative? (Query Only)

Returns the relative amplitude of the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:AMPLitude:RELative?`

Arguments

None

Returns

`<NRf>` Relative amplitude of the specified spurious signal in dB. Use the `[SENSe]:SPURious:REFerence` command to set the power reference.

Examples

`FETCH:SPURIOUS:SPUR1:AMPLITUDE:RELATIVE?` might return `-9.782`, indicating that the relative amplitude of Spurious #1 is -9.782 ndB.

FETCh:SPURious:SPUR<x>:FREQuency:ABSolute? (Query Only)

Returns the absolute frequency of the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:FREQuency:ABSolute?`

Arguments

None

Returns

`<NRf>` Absolute frequency of the spurious signal in Hz.

Examples

`FETCH:SPURIOUS:SPUR1:FREQUENCY:ABSOLUTE?` might return `2.235E+9`, indicating that the absolute frequency of Spurious #1 is 2.235 GHz.

FETCh:SPURious:SPUR<x>:FREQuency:RELative? (Query Only)

Returns the relative frequency of the specified spurious signal to the carrier in the Spurious measurement. This command is valid when `[SENSe]:SPURious:REFerence` is set to CARRier.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:FREQuency:RELative?`

Arguments

None

Returns

`<NRf>` Relative frequency of the spurious signal to the carrier in Hz.

Examples

`FETCH:SPURIOUS:SPUR1:FREQUENCY:RELATIVE` might return `3.634E+6`, indicating that the relative frequency of Spurious #1 is 3.634 MHz.

FETCh:SPURious:SPUR<x>:LIMit:ABSolute? (Query Only)

Returns the absolute amplitude of the limit for the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:LIMit:ABSolute?`

Arguments

None

Returns

`<NRf>` Absolute amplitude of the limit for the specified spurious signal in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:SPURIOUS:SPUR1:LIMIT:ABSOLUTE?` might return `-50.0`, indicating that the absolute amplitude of the limit for Spurious #1 is -50 dBm.

FETCh:SPURious:SPUR<x>:LIMit:RELative? (Query Only)

Returns the relative amplitude of the limit for the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:LIMit:RELative?`

Arguments

None

Returns

`<NRf>` Relative amplitude of the limit for the specified spurious signal in dB. Use the `[SENSe]:SPURious:REFerence` command to set the power reference.

Examples

`FETCH:SPURIOUS:SPUR1:LIMIT:RELATIVE?` might return `-10.0`, indicating that the relative amplitude of the limit for Spurious #1 is -10 dB.

FETCh:SPURious:SPUR<x>:LIMit:VIOLation? (Query Only)

Returns whether the specified spurious signal exceeds the limit or not.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:LIMit:VIOLation?`

Arguments

None

Returns

`0` (under the limit) or `1` (over the limit).

Examples

`FETCH:SPURIOUS:SPUR1:LIMIT:VIOLATION?` might return 1, indicating that Spurious #1 exceeds the limit.

FETCh:SPURious:SPUR<x>:RANGe? (Query Only)

Returns the frequency range in which the specified spurious signal occurred.

Conditions

Measurement views: Spurious

Group

Fetch commands

Syntax

`FETCh:SPURious:SPUR<x>:RANGe?`

Arguments

None

Returns

`<string>` "A" to "T" representing Range A to T, respectively.

Examples

`FETCH:SPURIOUS:SPUR1:RANGE` might return `"E"`, indicating that Spurious #1 is in Range E.

FETCh:SQUality[:MEASview<y>]:FREQuency:DEViation? (Query only)

Returns the frequency deviation in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to C4FM, FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:FREQuency:DEViation?

Arguments

None

Returns

<NRf> Frequency deviation in Hz.

Examples

FETCh:SQUality:MEASview1:FREQuency:DEViation? might return 12.68E+3, indicating the frequency deviation is 12.68 kHz for measurement view1.

FETCh:SQUality[:MEASview<y>]:FREQuency:DEViation:TABLe? (Query only)

Returns the number of columns and the values in the frequency deviation table for a signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to C4FM, FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:FREQuency:DEViation:TABLe?

Arguments

None

Returns

<Dev_Num>,{<Freq_dev_Max>,<Freq_dev_Min>,<Freq_dev_Avg>}

Where

<Dev_Num>::<NR1> is the number of columns in the frequency deviation table.

= 2 (2FSK), 4 (4FSK, C4FM), 8 (8FSK), or 16 (16FSK)

<Freq_dev_Max>::<NRf> is the maximum frequency deviation in Hz.

<Freq_dev_Min>::<NRf> is the minimum frequency deviation in Hz.

<Freq_dev_Avg>::<NRf> is the average frequency deviation in Hz.

The dataset <Freq_dev_Max>,<Freq_dev_Min>,<Freq_dev_Avg> is returned for each symbol in ascending order of its level (for example, in order of symbol -3, -1, +1, and +3 for 4FSK).

Examples

FETCh:SQUality:MEASview1FREQuency:DEVIation:TABLe? might return 2,1.257E+3,1.039E+3,1.162E+3,1.586E+3,1.298E+3,1.425E+3 for the frequency signal, populating the results table as follows.

Deviations	-1	+1
Maximum	1.257 kHz	1.586 kHz
Minimum	1.039 kHz	1.298 kHz
Average	1.162 kHz	1.425 kHz

FETCh:SQUality[:MEASview<y>]:FREQuency:ERRor? (Query only)

Returns the frequency error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:FREQuency:ERRor?

Arguments

None

Returns

<NRf> Frequency error in Hz.

Examples

FETCh:SQUality:MEASview1:FREQuency:ERRor? might return 612.043E+3, indicating that the frequency error is 612.043 kHz for measurement view 1.

FETCh:SQUality[:MEASview<y>]:GAIN:IMBalance? (Query only)

Returns the gain imbalance in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:GAIN:IMBalance?`

Arguments

None

Returns

`<NRf>` Gain imbalance in dB.

Examples

`FETCh:SQUality[:MEASview1:GAIN:IMBalance?` might return -57.746E-3, indicating that the gain imbalance is -0.057746 dB for measurement view 1.

FETCh:SQUality[:MEASview<y>]:ORIGin:OFFSet? (Query only)

Returns the origin offset in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:ORIGin:OFFSet?`

Arguments

None

Returns

`<NRf>` Origin offset in dB.

Examples

`FETCh:SQUality:MEASview1:ORIGin:OFFSet?` might return -44.968, indicating that the origin offset is -44.968 dB for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:EVM? (Query only)

Returns the peak EVM (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:EVM?`

Arguments

None

Returns

`<NRf>` Peak EVM in percent (%).

Examples

`FETCh:SQUality:MEASview1:PEAK:EVM?` might return 4.276, indicating that the peak EVM is 4.276% for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:EVM:DB? (Query only)

Returns the peak EVM (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:EVM:DB?`

Arguments

None

Returns

`<NRf>` Peak EVM in dB.

Examples

`FETCh:SQUality:MEASview1:PEAK:EVM:DB?` might return -27.358, indicating that the peak EVM is -27.358 dB for measurement view 1.

FETCh:SQUality[:MEASview<y>]:PEAK:EVM:DB:OFFSet? (Query only)

Returns the peak offset EVM (dB) in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

```
FETCh:SQUality[:MEASview<y>]:PEAK:EVM:DB:OFFSet?
```

Arguments

None

Returns

`<NRf>` Peak offset EVM in dB.

Examples

`FETCh:SQUality:MEASview1:PEAK:EVM:DB:OFFSet?` might return –37.624, indicating the peak offset EVM is -37.624 dB for measurement view 1.

FETCh:SQUality[:MEASview<y>]:PEAK:EVM:LOCation? (Query only)

Returns the time at which the EVM is peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

```
FETCh:SQUality[:MEASview<y>]:PEAK:EVM:LOCation?
```

Arguments

None

Returns

<NRf> The time in symbol number at which the EVM is peak.

The unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

FETCh:SQUality:MEASview1:PEAK:EVM:LOCation? might return 68.000, indicating that the EVM is peak at symbol #68.000 for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:EVM:LOCation:OFFSet? (Query only)

Returns the time at which the offset EVM is peak.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:PEAK:EVM:LOCation:OFFSet?

Arguments

None

Returns

<NRf> The time in symbol number at which the offset EVM is peak.

The unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

FETCh:SQUality:MEASview1:PEAK:EVM:LOCation:OFFSet? might return 123.00, indicating that the offset EVM is peak at symbol #123 for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:EVM:OFFSet? (Query only)

Returns the peak offset EVM (%) in the signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:EVM:OFFSet?`

Arguments

None

Returns

`<NRf>` Peak offset EVM in percent (%).

Examples

`FETCh:SQUality:MEASview1:PEAK:EVM:OFFSet?` might return 1.298, indicating the peak offset EVM is 1.298% for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:FERRor? (Query only)

Returns the peak FSK error in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:FERRor?`

Arguments

None

Returns

`<NRf>` Peak FSK error in percent (%).

Examples

`FETCh:SQUality:MEASview1:PEAK:FERRor?` might return 9.136, indicating the peak FSK error is 9.136% for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:MERRor:DB? (Query only)

Returns the peak magnitude error (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:MERRor:DB?`

Arguments

None

Returns

`<NRf>` Peak magnitude error in dB.

Examples

`FETCh:SQUality:MEASview1:PEAK:EVM:DB?` might return -27.358, indicating that the peak EVM is -27.358 dB for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:MERRor:LOCation? (Query only)

Returns the time at which the magnitude error is peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:MERRor:LOCation?`

Arguments

None

Returns

`<NRf>` The time in symbol number at which the magnitude error is peak.

The unit can be changed by the `[SENSe]:DDEMod:TIMe:UNITs` command.

Examples

`FETCh:SQUality:MEASview1:PEAK:MERRor:LOCation?` might return 68.000, indicating that the magnitude error is peak at symbol #68 for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:MERRor? (Query only)

Returns the peak magnitude error (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:PEAK:MERRor?`

Arguments

None

Returns

`<NRf>` Peak magnitude error in percent (%).

Examples

`FETCh:SQUality:MEASview1:PEAK:MERRor?` might return 3.595, indicating that the peak magnitude error is 3.595% for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:PERRor:LOCation? (Query only)

Returns the time at which the phase error is peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:PEAK:PERRor:LOCation?

Arguments

None

Returns

<NRf> The time in symbol number at which the phase error is peak.

The unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

FETCh:SQUality:MEASview1:PEAK:PERRor:LOCation? might return 68.000, indicating that the phase error is peak at symbol #68 for measurement view1.

FETCh:SQUality[:MEASview<y>]:PEAK:PERRor? (Query only)

Returns the peak phase error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:PEAK:PERRor?

Arguments

None

Returns

<NRf> Peak phase error in degrees.

Examples

FETCh:SQUality:MEASview1:PEAK:PERRor? might return 1.907, indicating that the peak phase error is 1.907 ° for measurement view1.

FETCh:SQUality[:MEASview<y>]:QUADrature:ERRor? (Query only)

Returns the quadrature error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:QUADrature:ERRor?`

Arguments

None

Returns

`<NRf>` Quadrature error in degrees.

Examples

`FETCh:SQUality:MEASview1:QUADrature:ERRor?` might return -14.264E-3, indicating that the quadrature error is -0.014264° for measurement view1.

FETCh:SQUality[:MEASview<y>]:RHO? (Query only)

Returns the ρ (waveform quality) value in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RHO?`

Arguments

None

Returns

`<NRf>` ρ value.

Examples

`FETCh:SQUality:MEASview1:RHO?` might return 998.703E-3, indicating that ρ is 0.998703 for measurement view1.

FETCh:SQUality[:MEASview<y>]:RMS:EVM? (Query only)

Returns the RMS EVM (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:EVM?`

Arguments

None

Returns

`<NRf>` RMS EVM in percent (%).

Examples

`FETCh:SQUality:MEASview1:RMS:EVM?` might return 2.417, indicating that the RMS EVM is 2.417% for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:EVM:DB? (Query only)

Returns the RMS EVM (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:EVM:DB?`

Arguments

None

Returns

`<NRf>` RMS EVM in dB.

Examples

`FETCh:SQUality:MEASview1:RMS:EVM:DB?` might return -32.356, indicating that the RMS EVM is -32.356 dB for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:EVM:DB:OFFSet? (Query only)

Returns the RMS offset EVM (dB) in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:EVM:DB:OFFSet?`

Arguments

None

Returns

`<NRf>` RMS offset EVM in dB.

Examples

`FETCh:SQUality:MEASview1:RMS:EVM:DB:OFFSet?` might return –41.276, indicating the RMS offset EVM is -41.276 dB for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:EVM:OFFSet? (Query only)

Returns the RMS offset EVM (%) in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:EVM:OFFSet?`

Arguments

None

Returns

<NRf> RMS offset EVM in percent (%).

Examples

FETCh:SQUality:MEASview1:RMS:EVM:OFFSet? might return 0.783, indicating the RMS offset EVM is 0.783% for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:FERRor? (Query only)

Returns the RMS FSK error percent in the signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

FETCh:SQUality[:MEASview<y>]:RMS:FERRor?

Arguments

None

Returns

<NRf> RMS FSK error in percent (%).

Examples

FETCh:SQUality:MEASview1:RMS:FERRor? might return 1.815, indicating the RMS FSK error is 1.815% for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:MER:DB? (Query only)

Returns the RMS MER (Modulation Error Ratio) in dB in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:MER:DB?`

Arguments

None

Returns

`<NRf>` RMS MER in dB.

Examples

`FETCh:SQUality:MEASview1:RMS:MER:DB?` might return 27.394, indicating that the RMS MER is 27.394 dB for measurement view1.

FETCh:SQUality[:MEASview<y>]:RMS:MERRor? (Query only)

Returns the RMS magnitude error (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:MERRor?`

Arguments

None

Returns

`<NRf>` RMS magnitude error in percent (%).

Examples

`FETCh:SQUality:MEASview1:RMS:MERRor?` might return 1.837, indicating that the RMS magnitude error is 1.837% for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:MERRor:DB? (Query only)

Returns the RMS magnitude error (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:MERRor:DB?`

Arguments

None

Returns

`<NRf>` RMS MERRor in dB.

Examples

`FETCh:SQUality:MEASview1:RMS:MERRor:DB?` might return -34.706, indicating that the magnitude error is -34.706 dB for measurement view 1.

FETCh:SQUality[:MEASview<y>]:RMS:PERRor? (Query only)

Returns the RMS phase error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

`FETCh:SQUality[:MEASview<y>]:RMS:PERRor?`

Arguments

None

Returns

`<NRf>` RMS phase error in degrees.

Examples

`FETCh:SQUality:MEASview1:RMS:PERRor?` might return 893.472E-3, indicating that the RMS phase error is 0.893472 °.

FETCh:SQUality[:MEASview<y>]:SYMBol:LENGth? (Query only)

Returns the number of analyzed symbols.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Fetch commands

Syntax

```
FETCh:SQUality[:MEASview<y>]:SYMBol:LENGth?
```

Returns

<NR1> Indicates the length of the synch word in symbols.

Examples

`FETCh:SQUality:MEASview1:SYMBol:LENGth?` might return 3, indicating the length is three symbols for measurement view 1.

FETCh:SQUality[:MEASview<y>]:SYMBol:RATE? (Query only)

Returns the value of the calculated symbol rate in Hz.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

It is valid when the modulation type is 2|4|8|16FSK and `[:SENSe]:DDEMod:SYMBol:RATE:SEARch` is ON.

Group

Fetch commands

Syntax

```
FETCh:SQUality[:MEASview<y>]:SYMBol:RATE?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:RATE:SEARch (on page 2097)

Returns

<NRf> is the calculated symbol rate in Hz.

Examples

`FETCh:SQUality:MEASview1:SYMBol:RATE?` might return 95.24E+3, indicating the calculated symbol rate is 95.24 kHz for measurement view 1.

FETCh:SQUality[:MEASview<y>]:SYMBol:RATE:ERRor? (Query only)

Returns the value of the symbol rate error in percent (%).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

It is valid when the modulation type is 2|4|8|16FSK and `[:SENSe]:DDEMod:SYMBol:RATE:SEARch` is ON.

Group

Fetch commands

Syntax

```
FETCh:SQUality[:MEASview<y>]:SYMBol:RATE:ERRor?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:RATE:SEARch (on page 2097)

Returns

`<NRf>` is the symbol error percent (%).

Examples

`FETCh:SQUality:MEASview1:SYMBol:RATE:ERRor?` might return -0.002, indicating that the symbol rate error is -0.002% for measurement view 1.

FETCh:TDIagram[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Trellis diagram measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Trellis diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Trellis diagram).

Group

Fetch commands

Syntax

```
FETCh:TDIagram[:MEASview<y>]:FERRor?
```

Arguments

None

Returns

<freq_error>::<NRf> is the frequency error in Hz.

Examples

FETCh:TDIagram:MEASview2:FERRor? might return -10.7E+3, indicating the frequency error is -10.7 kHz.

FETCh:TDIagram[:MEASview<y>]:TRACe? (Query only)

Returns the Trellis diagram trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Trellis diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Trellis diagram).

Group

Fetch commands

Syntax

FETCh:TDIagram[:MEASview<y>]:TRACe?

Arguments

None

Returns

#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<Y(n)> and <X(n)> is the phase in degrees and the time in (symbols) pair at the n^{th} data point. The 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCh:TDIagram:MEASview2:FDEVIATION? might return #3160xxxx... (160-byte data) for the Trellis diagram trace.

FETCh:TOVerview[:MEASview<y>] (Query Only)

Returns the trace data in the time overview.

Conditions

Measurement views: Time overview with specified Measurement view number

Group

Fetch commands

Syntax

FETCh:TOVerview[:MEASview<y>]?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude in dBm at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`FETCH:TOVERVIEW:MEASVIEW1?` might return #43204xxxx... (3204-byte data) for the trace in the time overview.

FETCh:TXGain:AVERage? (Query Only)

Returns the mean value of the trace.

Conditions

Measurement view: Transmission Gain

Group

Fetch commands

Syntax

`FETCh:TXGain:AVERage?`

Returns

<NRf> is the averaged value of the trace points in dB.

Examples

`FETCH:TXGAIN:AVERAGE?` might return 2.3, indicating that the mean value of the trace is 2.3 dB.

FETCh:TXGain:MAX? (Query Only)

Returns the maximum trace value.

Conditions

Measurement view: Transmission Gain

Group

Fetch commands

Syntax

`FETCh:TXGain:MAX?`

Returns

<NRf> is the maximum value of the trace in dB.

Examples

FETCH:TXGAIN:MAX? might return -3.45, indicating the maximum trace value is -3.45 dB.

FETCh:TXGain:MAXLocation? (Query Only)

Returns the frequency of the maximum trace value.

Conditions

Measurement view: Transmission Gain

Group

Fetch commands

Syntax

FETCh:TXGain:MAXLocation?

Returns

<NRf> is the frequency at the maximum trace value.

Examples

FETCH:TXGAIN:MAXLOCATION? might return 1E9, indicating the maximum trace value is at 1 GHz.

FETCh:TXGain:MIN? (Query Only)

Returns the minimum trace value.

Conditions

Measurement view: Transmission Gain

Group

Fetch commands

Syntax

FETCh:TXGain:MIN?

Returns

<NRf> is the frequency at the minimum trace value in dB.

Examples

FETCH:TXGAIN:MIN? might return -30, indicating the minimum trace value is -30 dB.

FETCh:TXGain:MINLocation? (Query Only)

Returns the frequency of the minimum trace value.

Conditions

Measurement view: Transmission Gain

Group

Fetch commands

Syntax

`FETCh:TXGain:MINLocation?`

Returns

`<NRf>` is the frequency at the minimum trace value.

Examples

`FETCH:TXGAIN:MINLOCATION?` might return `1E6`, indicating the minimum trace value is at 1 MHz.

FETCh:TXGain:TRACe<x>? (Query Only)

Returns the trace data of the selected trace.

Conditions

Measurement view: Transmission Gain Where <x> is the trace 1, 2, or 3.

Group

Fetch commands

Syntax

`FETCh:TXGain:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude in dB at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCh:TXGain:TRACe1?` might return `#43204xxxx...` (3204 byte data) for Trace 1 in the measurement.

FETCh:WLAN:AD:CONSte:DATA:EVM? (Query Only)

Queries the maximum EVM value in data Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:CONSte:DATA:EVM?`

Arguments

None

Returns

<NRf> = EVM value

Examples

FETCH:WLAN:AD:CONSTE:DATA:EVM? might return -42.482, indicating the EVM value present in the analysis data is -42.482 dB.

FETCh:WLAN:AD:CONSte:DATA:EVM:PEAK? (Query Only)

Queries the EVM Peak value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Fetch commands

Syntax

FETCh:WLAN:AD:CONSte:DATA:EVM:PEAK?

Arguments

None

Returns

<NRf> = EVM peak value

Examples

FETCH:WLAN:AD:CONSTE:DATA:EVM:PEAK? might return -35.325, indicating the EVM peak value is –35.325 dB.

FETCh:WLAN:AD:CONSte:DATA:EVM:PEAK:SYMBol? (Query Only)

Queries the EVM peak symbol value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Fetch commands

Syntax

FETCh:WLAN:AD:CONSte:DATA:EVM:PEAK:SYMBol?

Arguments

None

Returns

<NRf> = symbol value

Examples

`FETCH:WLAN:AD:CONSTE:DATA:EVM:PEAK:SYMBOL?` might return `6.312`, indicating the EVM peak symbol value is 6.312.

FETCh:WLAN:AD:CONSte:FERRor? (Query Only)

Queries the frequency Error value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:CONSte:FERRor?`

Arguments

None

Returns

<NR3>= frequency error

Examples

`FETCH:WLAN:AD:CONSTE:FERROR?` might return `3.344+3`, indicating the frequency error value is 3.344 kHz.

FETCh:WLAN:AD:CONSte:IQDC:OFFSet? (Query Only)

Queries IQ Origin Offset value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:CONSte:IQDC:OFFSet?`

Arguments

None

Returns

<NRf> = IQ Origin Offset value

Examples

`FETCH:WLAN:AD:CONSTE:IQDC:OFFSET?` might return `-51.841`, indicating the IQ Origin Offset value is –51.841 dB.

FETCh:WLAN:AD:EVM:TRACe? (Query Only)

Returns the EVM versus time trace data.

Conditions

Measurement views: 802.11ad EVM vs Time

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:EVM:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the EVM value at the nth data point in percent (%),

`<data(n)>` follows 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:WLAN:AD:EVM:TRACE?` might return `#42036xxxx...` (2036-byte data), indicating the EVM versus time trace data.

FETCh:WLAN:AD:SUMMary:AVERage:BURSt:COUNt (Query Only)

Queries the current burst number out of the total burst in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:AVERage:BURSt:COUNt?`

Arguments

None

Returns

<NR1>

Examples

`FETCH:WLAN:AD:SUMMARY:AVERAGE:BURST:COUNT?` might return `1`, indicating the current burst count is 1 out of the total burst.

FETCh:WLAN:AD:SUMMary:AVERage:BURSt:TOTAl:COUNt (Query Only)

Queries the total burst count to be averaged in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:AVERage:BURSt:TOTAl:COUNt?`

Arguments

None

Returns

<NR1>

Examples

`FETCH:WLAN:AD:SUMMARY:AVERAGE:BURST:TOTAL:COUNT?` might return `1`, indicating the total burst count to be averaged is 1.

FETCh:WLAN:AD:SUMMary:ESNR (Query Only)

Returns the value of Estimated SNR value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:ESNR?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:ESNR?` might return `36.856`, indicating the estimated SNR value is 36.856 dB.

FETCh:WLAN:AD:SUMMary:EVM:DATA:AVERage (Query Only)

Queries the Avg EVM (Data) value in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:DATA:AVERage?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:DATA:AVERAGE?` might return `-40.7035275551`, indicating the Avg EVM (Data) value is –40.70.

FETCh:WLAN:AD:SUMMary:EVM:DATA:AVERage:STATus (Query Only)

Queries the Avg EVM (Data) status in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:DATA:AVERage:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not applicable.

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:DATA:AVERAGE:STATUS?` might return `PASS`, indicating the Avg EVM test as passed.

FETCh:WLAN:AD:SUMMary:EVM:DATA:MAX (Query Only)

Queries the maximum EVM (Data) value in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:DATA:MAX?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:DATA:MAX?` might return `922.1968241036E-3`, indicating the maximum EVM (Data) value is 922.1968241036E-3.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:CEF:EVM (Query Only)

Queries the EVM value in the CEF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:CEF:EVM?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:CEF:EVM?` might return `6.9680400193`, indicating the EVM value in the CEF region of the packet is 6.96 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:CEF:PEAK (Query Only)

Queries the peak error value at the given symbol in CEF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:CEF:PEAK?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:CEF:PEAK?` might return `13.7763872743`, indicating the peak error at the given symbol in CEF region of the packet is 13.77 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:CEF:SYMBol (Query Only)

Queries the symbol at which the peak error occurred in the CEF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:CEF:SYMBol?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:CEF:SYMBOL?` might return `7.4020000000E+3`, indicating the peak error occurred in symbol 7.40 in the CEF region of the packet.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:EVM (Query Only)

Queries the EVM value in the DATA region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:EVM?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:DATA:EVM?` might return `-33.5668742100`, indicating the EVM value in the DATA region of the packet is -33.56 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:PEAK (Query Only)

Queries the peak error value at the given symbol in the DATA region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:PEAK?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:DATA:PEAK?` might return `-26.5964736883`, indicating the peak error value is −26.59 dB at the given symbol in DATA region of the packet.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:STATus (Query Only)

Queries the status of the DATA packet in Summary display in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable.

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:DATA:STATUS?` might return `PASS`, indicating the DATA packet test as passed.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:SYMBol (Query Only)

Queries the symbol at which the peak error occurred in the DATA region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:DATA:SYMBol?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:DATA:SYMBOL?` might return `4.6610000000E+3`, indicating that the symbol peak error occurred at 4.66 in the DATA region of the packet.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:GUARd:EVM (Query Only)

Queries the EVM value in Guard region of the Packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:GUARd:EVM?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:GUARD:EVM` might return `-65.4983500315`, indicating the EVM value in the Guard region of the packet is –65.49 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:GUARd:PEAK (Query Only)

Queries the peak error value at the given symbol in the Guard region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:GUARd:PEAK?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:GUARD:PEAK?` might return `-26.5964736883`, indicating the peak error at the given symbol in the Guard region of the packet is –26.59 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:GUARd:SYMBol (Query Only)

Queries the symbol at which the peak error occurred in the Guard region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:GUARd:SYMBol?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:GUARD:SYMBOL?` might return `3.3340000000E+3`, indicating the peak error occurred at symbol 3.33 in the Guard region of the packet.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:HEADer:EVM (Query Only)

Queries the EVM value in the Header region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:HEADer:EVM?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:HEADER:EVM?` might return `-67.1981081169`, indicating the EVM value in the Header region of the packet is –67.19 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:HEADer:PEAK (Query Only)

Queries the peak error at the given symbol in the Header region if the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:HEADer:PEAK?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:HEADER:PEAK?` might return `-60.9603086224`, indicating the peak error at the given symbol is –60.96 dB in the Header region of the packet.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:HEADer:SYMBol (Query Only)

Queries the symbol at which the peak Error occurred in the Header region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:HEADer:SYMBol?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:HEADER:SYMBOL?` might return `3.3970000000E+3`, indicating the symbol peak error occurred is 3.397 in Header region of the packet.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:STF:EVM (Query Only)

Queries the EVM value in the STF region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:EVM:PACKet:STF:EVM?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:STF:EVM?` might return `-22.9729890175`, indicating the EVM value in the STF region of the packet is –22.97 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:STF:PEAK (Query Only)

Queries the peak error value at the given symbol in the STF region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

```
FETCh:WLAN:AD:SUMMary:EVM:PACKet:STF:PEAK?
```

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:STF:PEAK?` might return `38.8123661280`, indicating the peak error at the given symbol in the STF region of the packet is 38.81 dB.

FETCh:WLAN:AD:SUMMary:EVM:PACKet:STF:SYMBol (Query Only)

Queries the symbol at which the peak error occurred in the STF region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

```
FETCh:WLAN:AD:SUMMary:EVM:PACKet:STF:SYMBol?
```

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:EVM:PACKET:STF:SYMBOL?` might return `0.0`, indicating the peak error occurred at the 0.0 symbol in the STF region of the packet.

FETCh:WLAN:AD:SUMMary:FERRor:AVERage (Query Only)

Queries the Avg Frequency Error value in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:FERRor:AVERage?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:FERROR:AVERAGE?` might return `-114.1332879317E-3`, indicating the Avg Frequency error is –114.1332879317E-3 ppm.

FETCh:WLAN:AD:SUMMary:FERRor:AVERage:STATus (Query Only)

Queries the Avg Frequency error status in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:FERRor:AVERage:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not applicable.

Examples

`FETCH:WLAN:AD:SUMMARY:FERROR:AVERAGE:STATUS?` might return `FAIL`, indicating the Avg Frequency error test failed.

FETCh:WLAN:AD:SUMMary:FERRor:HERTz (Query Only)

Queries the Frequency Error value in 802.11ad Summary display in Hz.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:FERRor:HERTz?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:FERROR:HERTZ?` might return `2.875E+3`, indicating the Frequency Error value is 2.875E+3 Hz.

FETCh:WLAN:AD:SUMMary:FERRor:MAX (Query Only)

Queries the Max Frequency error value in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:FERRor:MAX?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:FERROR:MAX?` might return `-114.1332879317E-3`, indicating the max frequency error is -114.1332879317E-3 ppm.

FETCh:WLAN:AD:SUMMary:FERRor:PPM (Query Only)

Queries the Frequency Error value in 802.11ad Summary display in ppm.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:FERRor:PPM?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:FERROR:PPM?` might return `575.023E-3`, indicating the Frequency Error value is 575.023E-3 ppm.

FETCh:WLAN:AD:SUMMary:FERRor:STATus (Query Only)

Queries the Frequency error status in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:FERRor:STATus?`

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not applicable.

Examples

`FETCH:WLAN:AD:SUMMARY:FERROR:STATUS?` might return `PASS`, indicating the frequency error test passed.

FETCh:WLAN:AD:SUMMary:IQ:GAIN:IMBALance (Query Only)

Queries IQ Gain Imbalance value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax
`FETCh:WLAN:AD:SUMMary:IQ:GAIN:IMBALance?`

Arguments
None

Returns
<NRf>

Examples
`FETCH:WLAN:AD:SUMMARY:IQ:GAIN:IMBALANCE?` might return `69.2700818181E-3`, indicating IQ Gain Imbalance value is 69.2700818181E-3% .

FETCh:WLAN:AD:SUMMary:IQ:ORIGin:OFFSet (Query Only)
Queries IQ Origin Offset value in 802.11ad Summary display.

Conditions
Measurement view: 802.11ad Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AD:SUMMary:IQ:ORIGin:OFFSet?`

Arguments
None

Returns
<NRf>

Examples
`FETCH:WLAN:AD:SUMMARY:IQ:ORIGIN:OFFSET?` might return `-160.0000000000`, indicating the IQ Origin Offset value is –160.0 dB.

FETCh:WLAN:AD:SUMMary:IQ:QUADrature:ERROr (Query Only)
Queries IQ Quadrature Error value in 802.11ad Summary display.

Conditions
Measurement view: 802.11ad Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AD:SUMMary:IQ:QUADrature:ERROr?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:IQ:QUADRATURE:ERROR?` might return `-220.5967903137E-3`, indicating IQ Quadrature Error value is -220.5967903137E-3 degrees.

FETCh:WLAN:AD:SUMMary:PACKet:AGGRegation (Query Only)

Queries the value of Aggregation packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:AGGRegation?`

Arguments

None

Returns

<Boolean> 0,1

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:AGGREGATION?` might return `"0"`, indicating the Aggregation packet value is 0.

FETCh:WLAN:AD:SUMMary:PACKet:BTR (Query Only)

Queries the value of Beam Tracking Request packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:BTR?`

Arguments

None

Returns

<Boolean> 0,1

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:BTR?` might return `0`, indicating the Beam Tracking Request packet value is 0.

FETCh:WLAN:AD:SUMMary:PACKet:HCS (Query Only)

Queries the value of HCS packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:HCS?`

Arguments

None

Returns

<String>

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:HCS?` might return `"1001010000001000"`, indicating the HCS packet value is 1001010000001000.

FETCh:WLAN:AD:SUMMary:PACKet:LENGth (Query Only)

Queries the value of Length packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:LENGth?`

Arguments

None

Returns

<String>

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:LENGTH?` might return `"1000"`, indicating the Length packet value is 1000.

FETCh:WLAN:AD:SUMMary:PACKet:MCS (Query Only)

Queries the value of MCS packet information in Summary display in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:MCS?`

Arguments

None

Returns

<NR1> Range is 0 to 12

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:MCS?` might return `5`, indicating the MCS packet value is 5.

FETCh:WLAN:AD:SUMMary:PACKet:PPDU (Query Only)

Queries the value of Additional PPDU packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:PPDU?`

Arguments

None

Returns

<Boolean> 0,1

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:PPDU?` might return `"0"`, indicating the Additional PPDU packet value is 0.

FETCh:WLAN:AD:SUMMary:PACKet:RSSI (Query Only)

Queries the value of Last RSSI packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:RSSI?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:RSSI?` might return `"0000"`, indicating the Last RSSI packet value is 0000.

FETCh:WLAN:AD:SUMMary:PACKet:SCRAmbler:INITialization (Query Only)

Queries the value of Scrambler initialization packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:PACKet:SCRAmbler:INITialization?`

Arguments

None

Returns

<String>

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:SCRAMBLER:INITIALIZATION?` might return `"0101110"`, indicating the Scrambler Initialization packet value is 0101110.

FETCh:WLAN:AD:SUMMary:PACKet:TAROUND (Query Only)

Queries the value of the Turnaround packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax
`FETCh:WLAN:AD:SUMMary:PACKet:TAROUND?`

Arguments
None

Returns
<Boolean> 0,1

Examples
`FETCH:WLAN:AD:SUMMARY:PACKET:TAROUND?` might return `"1"`, indicating the Turnaround packet value is 1.

FETCh:WLAN:AD:SUMMary:PACKet:TLEN (Query Only)
Queries the value of Training Length packet information in 802.11ad Summary display.

Conditions
Measurement view: 802.11ad Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AD:SUMMary:PACKet:TLEN?`

Arguments
None

Returns
<NRf>

Examples
`FETCH:WLAN:AD:SUMMARY:PACKET:TLEN?` might return `21`, indicating the Training Length packet value is 21.

FETCh:WLAN:AD:SUMMary:PACKet:TYPE (Query Only)
Queries the value of Packet Type information in 802.11ad Summary display.

Conditions
Measurement view: 802.11ad Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AD:SUMMary:PACKet:TYPE?`

Arguments
None

Returns

<Boolean> 0,1

Examples

`FETCH:WLAN:AD:SUMMARY:PACKET:TYPE?` might return `"0"`, indicating the Packet Type value is 0.

FETCh:WLAN:AD:SUMMary:RCPI (Query Only)

Queries the RCPI value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:RCPI?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:RCPI?` might return `207.0000000000`, indicating the RCPI is 207.

FETCh:WLAN:AD:SUMMary:RF:POWer (Query Only)

Queries the RF Output Power value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AD:SUMMary:RF:POWer?`

Arguments

None

Returns

<NRf>

Examples

`FETCH:WLAN:AD:SUMMARY:RF:POWER?` might return `-6.3434391022`, indicating the RF Output Power is -6.3434391022 dBm.

FETCh:WLAN:AY:CONSte:DATA:EVM:PEAK? (Query Only)

Query the Data Peak Error value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:CONSte:DATA:EVM:PEAK?`

Returns

`<NRf>`

You must select the units in the EVM tab.

Examples

`FETC:WLAN:AY:CONS:DATA:EVM:PEAK?` may return `-35.325`, which means -35.325 is the Data Peak Error value.

FETCh:WLAN:AY:CONSte:DATA:EVM:PEAK:SYMBol? (Query Only)

Query the Symbol position that contains the maximum Data EVM value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:CONSte:DATA:EVM:PEAK:SYMBol?`

Returns

`<NRf>`

Examples

`FETC:WLAN:AY:CONS:DATA:EVM:PEAK:SYMB?` may return `6.312e+0003`, which indicates that the 6312 Symbol contains the maximum Data EVM value.

FETCh:WLAN:AY:CONSte:DATA:EVM? (Query Only)

Query the maximum EVM value present in the analysis data in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:CONSte:DATA:EVM?`

Returns

`<NRf>`

You must select the units in the EVM tab.

Examples

`FETC:WLAN:AY:CONS:DATA:EVM?` may return `-42.482`, which means the maximum EVM value in the analysis data is -42.482.

FETCh:WLAN:AY:CONSte:FERRor? (Query Only)

Query the Frequency Error value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:CONSte:FERRor?`

Returns

`<NRf>`

Units: Hz

Examples

`FETC:WLAN:AY:CONS:FERR?` may return `0.0000`, which indicates that the Frequency Error value is 0.0000 Hz.

FETCh:WLAN:AY:CONSte:FREQuency:ERROr? (Query Only)

Query the Frequency Error value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:CONSte:FREQuency:ERROr?`

Returns

`<NRf>`

Units: Hz

Examples

`FETC:WLAN:AY:CONS:FREQ:ERRO?` may return `0.0000`, which means the Frequency Error value is 0.0000 Hz.

FETCh:WLAN:AY:CONSte:IQDC:OFFSet? (Query Only)

Query the IQ Origin Offset value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:CONSte:IQDC:OFFSet?`

Returns

`<NRf>`

Units: dB

Examples

`FETC:WLAN:AY:CONS:IQDC:OFFS?` may return `-51.841`, which indicates that the IQ Origin Offset value is -51.841 dB.

FETCh:WLAN:AY:EVM:TRACe? (Query Only)

Query the EVM versus Time trace data after doing a single run.

Conditions

Measurement views: 802.11ay Analysis EVM

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:EVM:TRACe?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the EVM value at the n^{th} data point in percentage (%).

`<data(n)>` follows 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`FETC:WLAN:AY:EVM:TRAC?` may return `#42036xxxx...` (2036-byte data) for the EVM versus time trace.

FETCh:WLAN:AY:SUMMary:AVERage:BURSt:COUNt? (Query Only)

Query the current Burst Count in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:AVERage:BURSt:COUNt?`

Returns

`<NR1>`

Examples

`FETC:WLAN:AY:SUMM:AVER:BURS:COUN?` may return `1`, which indicates that the current Burst Count is 1.

FETCh:WLAN:AY:SUMMary:AVERage:BURSt:TOTAl:COUNt? (Query Only)

Query the Total Burst Count to be averaged.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:AVERage:BURSt:TOTAl:COUNt?`

Returns

`<NR1>`

Examples

`FETC:WLAN:AY:SUMM:AVER:BURS:TOTA:COUN?` may return `1`, which indicates that the Total Burst Count to be averaged is 1.

FETCh:WLAN:AY:SUMMary:ESNR? (Query Only)

Query the Estimated SNR (Signal-to-Noise Ratio) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:ESNR?`

Returns
`<NRf>`

Units: dB

Examples
`FETC:WLAN:AY:SUMM:ESNR?` may return `34.50`, which indicates that the Estimated SNR value is 34.50 dB.

FETCh:WLAN:AY:SUMMary:EVM:DATA:AVERage? (Query Only)
Query the Average EVM (Data) value in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:EVM:DATA:AVERage?`

Returns
`<NRf>`

Units: dB or % (based on the selected EVM unit)

Examples
`FETC:WLAN:AY:SUMM:EVM:DATA:AVER?` may return `-40.7035275551`, which indicates that the Average EVM (Data) value is -40.7035275551%.

FETCh:WLAN:AY:SUMMary:EVM:DATA:AVERage:STATus? (Query Only)
Query the Average EVM (Data) Status in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:EVM:DATA:AVERage:STATus?`

Returns
<string>

Examples

FETC:WLAN:AY:SUMM:EVM:DATA:AVER:STAT? may return PASS, FAIL, or NA.

FETCh:WLAN:AY:SUMMary:EVM:DATA:MAX? (Query Only)

Query the Maximum EVM (Data) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:DATA:MAX?

Returns

<NRf>

Units: dB or % (based on the selected EVM unit)

Examples

FETC:WLAN:AY:SUMM:EVM:DATA:MAX? may return 922.1968241036e-3, which indicates that the Maximum EVM (Data) value is 922.1968241036e-3 dB.

FETCh:WLAN:AY:SUMMary:EVM:DATA:SIGma? (Query Only)

Query the Standard Deviation (1-Sigma) of the EVM Data.

When the EVM unit is in dB, it queries the Standard Deviation after converting evm values to the dB scale.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:DATA:SIGma?

Returns

<NRf>

Units: dB

Examples

FETC:WLAN:AY:SUMM:EVM:DATA:SIG? may return 1.8950, which indicates that the 1-Sigma EVM Data value is 1.8950 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:EVM? (Query Only)

Query the EVM value that occurs in the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:EVM?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:DATA:EVM?` may return `-33.5668742100`, which indicates that the EVM value is -33.5668742100%.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:PEAK? (Query Only)

Query the value of the Peak Error that occurs at the given Symbol in the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:PEAK?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:DATA:PEAK?` may return `-26.5964736883`, which indicates that the value of the Peak Error is -26.5964736883 at the given Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:STATus? (Query Only)

Query the status of the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:STATus?

Returns

<string>

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:DATA:STAT? may return PASS, FAIL, or NA.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:DATA:SYMBol?

Returns

<NRf>

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:DATA:SYMB? may return 4.6610000000e+3, which indicates that the Peak Error occurs at the 4.6610000000e+3 Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:EVM? (Query Only)

Query the EVM value in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:EVM?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:EDMG:CEF:EVM? may return 6.9680400193, which indicates that the EVM value is -6.9680400193 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in the 11ay 2.16 GHz BW and EDMG CEF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:PEAK?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:EDMG:CEF:PEAK? may return 13.7763872743, which indicates that the Peak Error value is 13.7763872743% at the given Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the 11ay 2.16 GHz BW and EDMG CEF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:SYMBol?

Returns

<NRf>

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:EDMG:CEF:SYMB? may return 7.4020000000e+3, which indicates that the Peak Error occurs at the 7.4020000000e+3 Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:EVM? (Query Only)

Query the EVM value in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:EVM?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:EDMG:STF:EVM?` may return `-22.9729890175`, which indicates that the EVM value is -22.9729890175 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:PEAK?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:EDMG:STF:PEAK?` may return `38.8123661280`, which indicates that the Peak Error value is 38.8123661280% at the given Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:SYMBol?`

Returns

`<NRf>`

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:EDMG:STF:SYMB?` may return `0.0000`, which indicates that the Peak Error occurs at the 0.0000 Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:GUARd:EVM? (Query Only)

Query the EVM value in the Guard Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:GUARd:EVM?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:GUAR:EVM?` may return `-65.4983500315`, which indicates that the value of the EVM is -65.4983500315 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:GUARd:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in the Guard Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:GUARd:PEAK?`

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:GUAR:PEAK?` may return `-26.5964736883`, which indicates that the value of the Peak Error is -26.5964736883 at the given Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:GUARd:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the Guard Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:GUARd:SYMBol?`

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:GUAR:SYMB?` may return `3.3340000000e+3`, which indicates that the Peak Error occurs at the 3.3340000000e+3 Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:HEADer:EVM? (Query Only)

Query the EVM value in the Header Region of the packet (excluding GI symbols) in the Summary display. This command is not applicable for 11ay 4.32 GHz BW and the value can be ignored.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:HEADer:EVM?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:HEAD:EVM? may return -67.1981081169, which indicates that the EVM value in the Header Region is -67.198108116 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:HEADer:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in Header Region (excluding GI symbols) of the packet in the Summary display. This command is not applicable for 11ay 4.32 GHz BW and the value can be ignored.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:HEADer:PEAK?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

FETC:WLAN:AY:SUMM:EVM:PACK:HEAD:PEAK? may return -60.9603086224, which indicates that the Peak Error value is -60.9603086224 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:HEADer:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the Header Region of the packet (excluding GI symbols) in the Summary display. This command is not applicable for 11ay 4.32 GHz BW and the value can be ignored.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:EVM:PACKet:HEADer:SYMBol?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:HEAD:SYMB?` may return `3.3970000000e+3`, which indicates that the peak error occurs at the 3.3970000000e+3 Symbol.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg: A1Header:EVM? (Query

Query the value of the Pre-EDGM1 Header-A EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:A1Header:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE1E:A1H:EVM?` may return `-34.3702`, which indicates that the value of the Pre-EDGM1 Header-A EVM packet is -34.3702 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg: CEF1:EVM? (Query Only)

Query the value of the Pre-EDMG1 CEF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:CEF1:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE1E:CEF1:EVM?` may return `-34.5666`, which indicates that the value of the Pre-EDMG1 CEF EVM packet is -34.5666 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg: GUARd1:EVM? (Query

Query the value of the Pre-EDMG1 EVM Guard region of the packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:GUARd1:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE1ELGUAR1:EVM?` may return `-34.1327`, which indicates that the value of the Pre-EDMG1 EVM Guard Region is -34.1327 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg :HEADer1:EVM? (Query

Query the value of the Pre-EDMG1 L-Header EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:HEADer1:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVMPACK:PRE1E:HEAD1:EVM?` may return `-34.4326`, which indicates that the value of the Pre-EDMG1 L-Header EVM packet is -34.4326 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:STF1:EVM? (Query Only)

Query the value of the Pre-EDMG1 STF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:STF1:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE1E:STF1:EVM?` may return `-33.6325`, which indicates that the value of the Pre-EDMG1 STF1 EVM packet is -33.6325 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:A2Header:EVM? (Query

Query the value of the Pre-EDMG2 EDMG Header-A EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:A2Header:EVM?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE2E:A2H:EVM?` may return `-34.37`, which indicates that the value of the Pre-EDMG2 EDMG-Header-A EVM packet is -34.37 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:CEF2:EVM? (Query Only)

Query the value of the Pre-EDMG2 CEF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:CEF2:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE2E:CEF2:EVM?` may return `-34.5665`, which indicates that the value of the Pre-EDMG2 CEF EVM packet is -34.5665 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:GUARd2:EVM? (Query

Query the value of the Pre-EDMG2 Guard EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:GUARd2:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE2E:GUAR:EVM?` may return `-33.137`, which indicates that the value of the Pre-EDMG2 Guard EVM packet is -33.137 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:HEADer2:EVM? (Query

Query the value of the Pre-EDMG2 L-Header EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:HEADer2:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE2E:HEAD2:EVM?` may return `-34.4321`, which indicates that the value of the Pre-EDMG2 L-Header EVM packet is -34.4321 dB.

FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg: STF2:EVM? (Query Only)

Query the value of the Pre-EDMG2 STF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:STF2:EVM?`

Returns

<string>

Units: dB or % (based on the EVM unit selected)

Examples

`FETC:WLAN:AY:SUMM:EVM:PACK:PRE2E:STF2:EVM?` may return `-33.6324`, which indicates that the value of the Pre-EDMG2 STF2 EVM packet is -33.6324 dB.

FETCh:WLAN:AY:SUMMary:FERRor:AVERage? (Query Only)

Query the Average Frequency Error value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:FERRor:AVERage?`

Returns

`<NRf>`

Units: ppm

Examples

`FETC:WLAN:AY:SUMM:FERR:AVER?` may return `-114.1332879317e-3`, which indicates that the Average Frequency Error value is -114.1332879317e-3 ppm.

FETCh:WLAN:AY:SUMMary:FERRor:AVERage:STATus? (Query Only)

Query the Average Frequency Error status in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:FERRor:AVERage:STATus?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:FERR:AVER:STAT?` may return `PASS`, `FAIL`, or `NA`.

FETCh:WLAN:AY:SUMMary:FERRor:HERTz? (Query Only)

Query the Frequency Error value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:FERRor:HERTz?`

Returns

`<NRf>`

Units: Hz or kHz

Examples

`FETC:WLAN:AY:SUMM:FERR:HERT?` may return `2.875e+3`, which indicates that the Frequency Error value is 2.875 kHz.

FETCh:WLAN:AY:SUMMary:FERRor:MAX? (Query Only)

Query the Maximum Frequency Error value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:FERRor:MAX?`

Returns
`<NRf>`

Units: ppm

Examples
`FETC:WLAN:AY:SUMM:FERR:MAX?` may return `-114.1332879317e-3`, which indicates that the Maximum Frequency Error is -114.1332879317e-3 ppm.

FETCh:WLAN:AY:SUMMary:FERRor:PPM? (Query Only)
Query the Frequency Error value in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:FERRor:PPM?`

Returns
`<NRf>`

Units: ppm

Examples
`FETC:WLAN:AY:SUMM:FERR:PPM?` may return `575.023e-3`, which indicates that the Frequency Error value is 575.023e-3 ppm.

FETCh:WLAN:AY:SUMMary:FERRor:STATus? (Query Only)
Query the Frequency Error status in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:FERRor:STATus?`

Returns
`<string>`

Examples
`FETC:WLAN:AY:SUMM:FERR:STAT?` may return `PASS`, `FAIL`, or `NA`.

FETCh:WLAN:AY:SUMMary:IQ:GAIN:IMBALance? (Query Only)

Query the IQ Gain Imbalance value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

```
FETCh:WLAN:AY:SUMMary:IQ:GAIN:IMBALance?
```

Returns

<NRf>

Units: dB

Examples

`FETC:WLAN:AY:SUMM:IQ:GAIN:IMBAL?` may return `69.2700818181e-3`, which indicates that the IQ Gain Imbalance value is 69.2700818181e-3 dB.

FETCh:WLAN:AY:SUMMary:IQ:ORIGin:OFFSet? (Query Only)

Query the IQ Origin Offset value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

```
FETCh:WLAN:AY:SUMMary:IQ:ORIGin:OFFSet?
```

Returns

<NRf>

Units: dB

Examples

`FETC:WLAN:AY:SUMM:IQ:ORIG:OFFS?` may return `-160.0000000000`, which indicates that the IQ Origin Offset value is -160.0000000000 dB.

FETCh:WLAN:AY:SUMMary:IQ:QUADrature:ERROr? (Query Only)

Query the IQ Quadrature Error value (degrees) in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:IQ:QUADrature:ERROr?`

Returns
<NRf>

Units: degrees

Examples
`FETC:WLAN:AY:SUMM:IQ:QUAD:ERRO?` may return `-220.5967903137e-3`, which indicates that the IQ Quadrature Error value is -220.5967903137e-3 degrees.

FETCh:WLAN:AY:SUMMary:PACKet:AGGRegation? (Query Only)
Query the value of the Aggregation packet information in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:PACKet:AGGRegation?`

Returns
`<string>`

Examples
`FETC:WLAN:AY:SUMM:PACK:AGGR?` may return `1111`, which indicates that the Aggregation value is 1111.

FETCh:WLAN:AY:SUMMary:PACKet:BEAMformed? (Query Only)
Query the value of the Beamformed packet information in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Fetch commands

Syntax
`FETCh:WLAN:AY:SUMMary:PACKet:BEAMformed?`

Returns
`<string>`

Examples
`FETC:WLAN:AY:SUMM:PACK:BEAM?` may return `0`, which indicates that the value of the Beamformed packet is 0.

FETCh:WLAN:AY:SUMMary:PACKet:BWBitmap? (Query Only)

Query the value of the Bandwidth BitMap packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:BWBitmap?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:PACK:BWB?` may return `11000000`, which indicates that the value of the Bandwidth BitMap packet is 11000000.

FETCh:WLAN:AY:SUMMary:PACKet:COMPbw? (Query Only)

Query the value of the Compressed BW packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:COMPbw?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:PACK:COMP?` may return `2`, which indicates that the value of the Compressed BW packet is 2.

FETCh:WLAN:AY:SUMMary:PACKet:CRC? (Query Only)

Query the value of the CRC packet information in the Summary display.

Conditions

Measurement view 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:PACKet:CRC?

Returns

<string>

Examples

FETC:WLAN:AY:SUMM:PACK:CRC? may return 0110001001011010, which indicates that the value of the CRC packet is 0110001001011010.

FETCh:WLAN:AY:SUMMary:PACKet:EDMGmcs? (Query Only)

Query the value of the EDMG MCS packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:PACKet:EDMGmcs?

Returns

<NRf>

Examples

FETC:WLAN:AY:SUMM:PACK:EDMG? may return 5, which indicates that the value of the EDMG MCS packet is 5.

FETCh:WLAN:AY:SUMMary:PACKet:LDPCcwlen? (Query Only)

Query the value of the additional LPDC CW Length packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:PACKet:LDPCcwlen?

Returns

<string>

Examples

FETC:WLAN:AY:SUMM:PACK:LDPC? may return 0, which indicates that the value of the LDPC CW Length packet is 0.

FETCh:WLAN:AY:SUMMary:PACKet:PRIMarychannel? (Query Only)

Query the value of the Primary Channel packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:PRIMarychannel?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:PACK:PRIM?` may return `0`, which indicates that the value of the Primary Channel packet is 0.

FETCh:WLAN:AY:SUMMary:PACKet:PSDUlen? (Query Only)

Query the Length value of the packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:PSDUlen?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:PACK:PSDU?` may return `1000`, which indicates that the Length value of the packet is 1000.

FETCh:WLAN:AY:SUMMary:PACKet:RSSI? (Query Only)

Query the value of the last RSSI packet information in the Summary display.

The first 2 bits of the last RSSI will fetch the Guard Interval type for EDMG (00/01/10 - Short/Normal/Long).

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:RSSI?`

Returns

<string>

Examples

FETC:WLAN:AY:SUMM:PACK:RSSI? may return 0000, which indicates that the last value of the RSSI packet is 0000.

FETCh:WLAN:AY:SUMMary:PACKet:SCRAmbler:INITialization? (Query Only)

Query the value of the Scrambler Initialization packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:PACKet:SCRAmbler:INITialization?

Returns

<string>

Examples

FETC:WLAN:AY:SUMM:PACK:SCRA:INIT? may return 0101110, which indicates that the value of the Scrambler Initialization packet is 0101110.

FETCh:WLAN:AY:SUMMary:PACKet:SPATialstreams? (Query Only)

Query the value of the Spatial Streams packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:PACKet:SPATialstreams?

Returns

<string>

Examples

FETC:WLAN:AY:SUMM:PACK:SPAT? may return 0, which indicates that the value of the Spatial Streams packet is 0.

FETCh:WLAN:AY:SUMMary:PACKet:STBCapplied? (Query Only)

Query the value of the STBC Applied packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:STBCapplied?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:PACK:STBC?` may return `0`, which indicates that the value of the STBC Applied packet is 0.

FETCh:WLAN:AY:SUMMary:PACKet:TRNLen ? (Query Only)

Query the value of the EDMG TRN Length packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:PACKet:TRNLen?`

Returns

`<string>`

Examples

`FETC:WLAN:AY:SUMM:PAC:TRNL?` may return `0`, which indicates that the value of the EDMG TRN Length packet is 0.

FETCh:WLAN:AY:SUMMary:RCPI? (Query Only)

Query the RCPI (Received Channel Power Indicator) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

`FETCh:WLAN:AY:SUMMary:RCPI?`

Returns

<NR1>

Examples

FETC:WLAN:AY:SUMM:RCPI? may return 207.0000000000, which indicates that the RCPI value is 207.0000000000.

FETCh:WLAN:AY:SUMMary:RF:POWer? (Query Only)

Query the Radio Frequency (RF) Output Power value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:RF:POWer?

Returns

<NRf>

You must select the units in the Units tab.

Examples

FETC:WLAN:AY:SUMM:RF:POW? may return -6.3434391022, which indicates that the Radio Frequency Output Power value is -6.3434391022.

FETCh:WLAN:AY:SUMMary:SIG:QUAlity? (Query Only)

Query the Signal Quality value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Fetch commands

Syntax

FETCh:WLAN:AY:SUMMary:SIG:QUAlity?

Returns

<NRf>

Units: rho

Examples

FETC:WLAN:AY:SUMM:SIG:QUA? may return 999.6323e-3, which indicates that the Signal Quality value is 999.6323e-3 rho.

FETCh:WLAN:CONSte:MAGNitude? (Query Only)

Returns the magnitude data for the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:CONSte:MAGNitude?`

Returns

Returned data is in the form

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>` where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

`FETC:WLAN:CONS:MAGN?` might return `#510400..` (10400-byte data) for the measurement.

FETCh:WLAN:CONSte:PHASe? (Query Only)

Returns the phase values for the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:CONSte:PHASe?`

Returns

Returned data is in the form

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

`FETCH:WLAN:CONS:PHAS?` might return `#510400..` (10400-byte data) for the measurement.

FETCh:WLAN:CONSte:TYPE? (Query Only)

Returns the type (context) for the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:CONSte:TYPE?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in 16-bit little endian integers. The integers must be translated to the proper context as listed below.

Integer value Type (context):

- 1 Pilot
- 2 Data

Examples

`FETCH:WLAN:CONS:TYPE?` might return `#41352..` (1352-byte data) for the measurement. The actual data must be decoded to the context type using the table above.

FETCh:WLAN:CONSte:VALue? (Query Only)

Returns the value (decoded symbol) for the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:CONSte:VALue?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in 16-bit little endian integers.

Examples

FETCH:WLAN:CONSTE:VALUE? might return #41352 indicating 1352 bytes of data for the measurement.

FETCh:WLAN:CRESponse:MAGNitude? (Query Only)

Returns the magnitude data of the WLAN Channel Response measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:CRESponse:MAGNitude?

Returns

Returned data is in the form

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

FETC:WLAN:CRES:MAGN? might return #510400.. (10400-byte data) for the measurement.

FETCh:WLAN:CRESponse:PHASe? (Query Only)

Returns the phase data of the WLAN Channel Response measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:CRESponse:PHASe?

Returns

Returned data is in the form

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

FETCH:WLAN:CRES:PHAS? might return #510400.. (10400-byte data) representing the phase data for the measurement.

FETCh:WLAN:EVM:TRACe<x>? (Query Only)

Returns the trace data for the selected WLAN EVM trace. When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbol. When <x> is 3, the parameter is Average versus Subcarrier

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:EVM:TRACe<x>?

Returns

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

Where:

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:WLAN:EVM:TRAC2? might return #510400.. (10400-byte data) for the measurement.

FETCh:WLAN:FLATness:PASS? (Query Only)

Queries whether the average power level values of the subcarriers across the signal bandwidth on the WLAN Spectral Flatness display remain within the limits defined for a particular standard.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:FLATness:PASS?

Returns

Returns "1" in the case that all data remains within the defined limits, and "0" otherwise.

Examples

FETCH:WLAN:FLAT:PASS? might return 1, which means that the average power level values of the subcarriers across the signal bandwidth remain within the defined limits.

FETCh:WLAN:FLATness:RESult? (Query Only)

Returns the summary results of each segment of the WLAN Spectral Flatness display.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:FLATness:RESult?

Returns

The data is returned as 12 comma delineated text values. The specific values are :

- minimum subcarrier within segment 1
- minimum subcarrier average energy deviation from the global average within segment 1
- deviation the of minimum subcarrier average from the allowed value in segment 1
- maximum subcarrier within segment 1
- maximum subcarrier average energy deviation from the global average within segment 1
- deviation of the maximum subcarrier average from the allowed value in segment 1
- minimum subcarrier within segment 2
- minimum subcarrier average energy deviation from the global average within segment 2
- deviation the of minimum subcarrier average from the allowed value in segment 2
- maximum subcarrier within segment 2
- maximum subcarrier average energy deviation from the global average within segment 2
- deviation of the maximum subcarrier average from the allowed value in segment 2

Examples

FETCH:WLAN:FLAT:RES? might return -6.0000000000,-17.0626174659E-3,3.9829373825,12.0000000000,19.979260, which represents the summary results of each segment of the WLAN Spectral Flatness display.

FETCh:WLAN:FLATness:TRACe<x>? (Query Only)

Returns the WLAN Spectral Flatness trace data. When <x> is 1, the parameter is Matrix (symbol deviation per subcarrier). When<x> is 2, the parameter is Average Deviation vs Subcarrier.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:FLATness:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:WLAN:FLAT:TRACE2?` might return `#510400..` (10400-byte data) for the measurement.

FETCh:WLAN:MERRor:TRACe<x>? (Query Only)

Returns the trace data for the selected WLAN Magnitude Error trace.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbol.

When <x> is 3, the parameter is Average versus Subcarrier

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:MERRor:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:WLAN:MERR:TRAC2? might return #510400.. (10400-byte data) for the measurement.

FETCh:WLAN:PERRor:TRACe<x>? (Query Only)

Returns the trace data for the selected WLAN Phase Error trace.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbol.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:PERRor:TRACe<x>?

Returns

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

Where:

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

FETCH:WLAN:PERR:TRAC2? might return #510400.. (10400-byte data) for the measurement.

FETCh:WLAN:PVTime:BURSt:POWer? (Query Only)

Returns the average power of the burst packet, in dBm, for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:PVTime:BURSt:POWer?

Returns

Floating point number that represents the average power of the burst packet, in dBm.

Examples

`FETCH:WLAN:PVT:BURST:POWER?` might return `-1.99`, which represents the value of the average power of the burst packet of -1.99 dBm.

FETCh:WLAN:PVTime:BURSt:WIDTh? (Query Only)

Returns the value of the measured time width of the burst packet from Power-On to Power-Down (or end of waveform, if that occurs before Power-Down), in seconds, for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:BURSt:WIDTh?`

Returns

Floating point number which represents the value of the measured time width of the burst packet from Power-On to Power-Down (or end of waveform, if that occurs before Power-Down), in seconds.

Examples

`FETCH:WLAN:PVT:BURST:WIDTH?` might return `156.0000000000E-6`, which represents a width of the burst packet of 156 µS.

FETCh:WLAN:PVTime:FALL:TIME? (Query Only)

Returns the value of the width of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:FALL:TIME?`

Returns

Floating point number which represents the value of the width of the falling edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:FALL:TIME?` might return `7e-6`, which indicates the width of the falling edge is 7 µs.

FETCh:WLAN:PVTime:FALL:TIME:STARt? (Query Only)

Returns the value of the start time of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:FALL:TIME:STARt?`

Returns

Floating point number which represents the value of the start time of the falling edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:FALL:TIME:STAR?` might return `6e-6`, which indicates that the start time of the falling edge is at 6 µs.

FETCh:WLAN:PVTime:FALL:TIME:STOP? (Query Only)

Returns the value of the stop time of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:FALL:TIME:STOP?`

Returns

Floating point number which represents the value of the stop time of the falling edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:FALL:TIME:STOP?` might return `7e-6`, which indicates the stop time of the falling edge is at 7 µs.

FETCh:WLAN:PVTime:FTIMe? (Query Only)

Returns the value of the width of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:PVTime:FTIMe?

Returns

Floating point number which represents the value of the width of the falling edge of the burst, in seconds.

Examples

FETCH:WLAN:PVT:FALL:TIME? might return 7e-6, which indicates the width of the falling edge is 7 µs.

FETCh:WLAN:PVTime:RISE:TIME? (Query Only)

Returns the value of the width of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:PVTime:RISE:TIME?

Returns

Floating point number which represents the value of the width of the rising edge of the burst, in seconds.

Examples

FETCH:WLAN:PVT:RISE:TIME? might return 7e-6, which indicates the width of the rising edge is 7 µs.

FETCh:WLAN:PVTime:RISE:TIME:STARt? (Query Only)

Returns the value of the start time of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

FETCh:WLAN:PVTime:RISE:TIME:STARt?

Returns

Floating point number which represents the value of the start time of the rising edge of the burst, in seconds.

Examples

FETCH:WLAN:PVT:RISE:TIME:STAR? might return 6e-6, which indicates the start time of the rising edge is at 6 µs.

FETCh:WLAN:PVTime:RISE:TIME:STOP? (Query Only)

Returns the value of the stop time of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:RISE:TIME:STOP?`

Returns

Floating point number which represents the value of the stop time of the rising edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:RISE:TIME:STOP?` might return `7e-6`, which indicates the stop time of the rising edge is at 7 µs.

FETCh:WLAN:PVTime:RTIMe? (Query Only)

Returns the value of the width of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:RTIMe?`

Returns

Floating point number which represents the value of the width of the rising edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:RISE:TIME?` might return `7e-6`, which indicates the width of the rising edge is 7 µs.

FETCh:WLAN:PVTime:TRACe:X? (Query Only)

Returns the horizontal values (time in seconds) for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:TRACe:X?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:WLAN:PVT:TRAC:X` might return `#43204` (3204-byte data), which represents the time in seconds (horizontal values) for the WLAN Power vs. Time trace.

FETCh:WLAN:PVTime:TRACe:XY? (Query Only)

Returns the horizontal value (time in seconds) and vertical value (power) for the WLAN Power vs. Time trace.

<x(n)><y(n)> is the horizontal value and vertical value pair at the nth data point.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:TRACe:XY?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:WLAN:PVT:TRAC:XY?` might return `#43204` (3204-byte data), which represents the horizontal value (time in seconds) and vertical value (power) pair at the nth data point.

FETCh:WLAN:PVTime:TRACe[:Y]? (Query Only)

Returns the vertical values (power) for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:PVTime:TRACe[:Y]?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:WLAN:PVT:TRAC:Y?` might return `#43204` (3204-byte data), which represents the vertical values (power) for the WLAN Power vs. Time trace.

FETCh:WLAN:STABle:VALUe? (Query Only)

Returns the number of bytes in the symbol table for the WLAN measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

`FETCh:WLAN:STABle:VALUe?`

Returns

#<num_digit><num_byte>

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

Examples

`FETCH:WLAN:STABLE:VALUE?` might return `#43848` indicating that there are 3848 bytes of data in the symbol table.

FETCh:WLAN:SUMMary:BURSt:INDex? (Query Only)

Returns the index of the analyzed packet within the analysis record.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:BURSt:INDex?
```

Arguments

None

Returns

<NRf>

FETCh:WLAN:SUMMary:BURSt:POWer? (Query Only)

Returns the average power of all symbols in the packet, including Preamble and Data segments.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:BURSt:POWer?
```

Arguments

None

Returns

<NRf> data in dBm.

FETCh:WLAN:SUMMary:BURSt:POWer:CFACtor? (Query Only)

Returns the peak-to-average burst power factor in the WLAN measurement. The ratio of the highest instantaneous signal power level to the average signal power.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:BURSt:POWer:CFACtor?
```

Arguments

None

Returns

<NRf> data in dB.

FETCh:WLAN:SUMMary:CERRor? (Query Only)

Returns the symbol clock error in the WLAN measurement. Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:CERRor?
```

Arguments

None

Returns

<NRf> data in parts per million.

FETCh:WLAN:SUMMary:CPE? (Query Only)

Returns the RMS magnitude error of the pilots over all data symbols.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:CPE?
```

Arguments

None

Returns

<NRf> data in percent.

FETCh:WLAN:SUMMary:EVM:PEAK:ALL? (Query Only)

Returns the peak EVM value for all subcarriers in the WLAN measurement or for all chips depending on the selected standard.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:ALL?
```

Arguments

None

Returns

<NRf> data in dB.

FETCh:WLAN:SUMMary:EVM:PEAK:CHIP:ALL? (Query Only)

Returns the chip at which the reported peak EVM value occurred. Available only for 802.11b

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:CHIP:ALL?
```

Arguments

None

Returns

<NR1>

FETCh:WLAN:SUMMary:EVM:PEAK:CHIP:ONEKchips? (Query Only)

Returns the chip at which the reported peak EVM value over the first 1000 chips occurred.

Only available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:CHIP:ONEKchips?
```

Arguments

None

Returns

<NR1>

FETCh:WLAN:SUMMary:EVM:PEAK:DATA? (Query Only)

Returns the peak EVM value for the data subcarriers in the WLAN measurement. Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:DATA?
```

Arguments

None

Returns

<NRf> data in dB.

FETCh:WLAN:SUMMary:EVM:PEAK:ONEKchips? (Query Only)

Returns the peak EVM value measured over the first 1000 chips. Available only for 802.11b.

Conditions

Measurement view: WLAN

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:ONEKchips?
```

Arguments

None

Returns

<NRf> data in dB.

FETCh:WLAN:SUMMary:EVM:PEAK:PILots? (Query Only)

Returns the peak EVM value for the pilots in the WLAN measurement. Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:PILots?
```

Arguments

None

Returns

<NRf> data in dB.

FETCh:WLAN:SUMMary:EVM:PEAK:SCARrier:ALL? (Query Only)

Returns the subcarrier on which the ALL peak EVM value occurred.

Conditions

Measurement view: WLAN

Syntax

```
FETCh:WLAN:SUMMary:EVM:PEAK:SYMBol:PILots?
```

Arguments

None

Returns

<NR1>

FETCh:WLAN:SUMMary:EVM:RMS:ALL? (Query Only)

Returns the RMS EVM data for all subcarriers in the WLAN measurement and for all chips for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:RMS:ALL?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

FETCh:WLAN:SUMMary:EVM:RMS:AVERage? (Query Only)

Returns the average RMS EVM value in the WLAN measurement over the selected number of bursts.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:RMS:AVERage?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

FETCh:WLAN:SUMMary:EVM:RMS:DATA? (Query Only)

Returns the RMS EVM data for the data subcarriers in the WLAN measurement. Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:RMS:DATA?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

FETCh:WLAN:SUMMary:EVM:RMS:MAXimum? (Query Only)

Returns the maximum RMS EVMvalue in the WLAN measurement over the selected number of bursts.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:RMS:MAXimum?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

FETCh:WLAN:SUMMary:EVM:RMS:ONEKchips? (Query Only)

Returns the EVM RMSdata for the 1k chips in the WLAN measurement measured over the first 1000 chips.

Only available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:RMS:ONEKchips?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

FETCh:WLAN:SUMMary:EVM:RMS:PILots? (Query Only)

Returns the RMS EVM data for the pilot subcarriers in the WLAN measurement. Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:EVM:RMS:PILots?
```

Arguments

None

Returns

<NRf> data in percent.

FETCh:WLAN:SUMMary:FERRor? (Query Only)

Returns the frequency difference between the measured carrier frequency of the signal and the measurement frequency setting.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:FERRor?
```

Arguments

None

Returns

<NRf> data in kHz.

FETCh:WLAN:SUMMary:HEADer? (Query Only)

Returns the received packet header information for the WLAN measurement. Applies to the 802.11b standard only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:HEADer?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

FETCh:WLAN:SUMMary:HTSig? (Query Only)

Returns the decimal values of the received packet HT-SIGNAL. Applies to the 802.11n standard only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:HTSig?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

FETCh:WLAN:SUMMary:IQOFfset? (Query Only)

Returns the average magnitude of the DC subcarrier level relative to total signal power.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:IQOFfset?
```

Arguments

None

Returns

<NRf> data in dB.

FETCh:WLAN:SUMMary:LSIG? (Query Only)

Returns the decimal values of the received packet (legacy) SIGNAL symbols

fields. Applies to the 802.11n standard only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:LSIG?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

FETCh:WLAN:SUMMary:PACKet? (Query Only)

Returns the type and number of symbols, EVM-RMS and average power of the Preamble and Data portions of the packet.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:PACKet?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

FETCh:WLAN:SUMMary:PACKet:DMODulation? (Query Only)

Returns the modulation used in the Data symbols.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:PACKet:DMODulation?
```

Returns

<string> The data modulation being used.

FETCh:WLAN:SUMMary:PACKet:FORMat? (Query Only)

Returns the packet format setting for the WLAN measurement

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:PACKet:FORMat?
```

Arguments

None

Returns

<string> The packet format setting.

FETCh:WLAN:SUMMary:PACKet:GUARd? (Query Only)

Returns the packet guard interval used by the DATA symbols. Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax

```
FETCh:WLAN:SUMMary:PACKet:GUARd?
```

Arguments

None

Returns

<NRf> The packet guard interval, 1/4 or 1/8.

FETCh:WLAN:SUMMary:SIG? (Query Only)

Returns the decimal values of the received packet SIGNAL symbols fields. Available only for 802.11agjp.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Fetch commands

Syntax
```
FETCh:WLAN:SUMMary:SIG?
```

Arguments
None

Returns
Results are returned in the same left-to-right order in which they are presented in the display.

FETCh:WLAN:SUMMary:VHTSig:A? (Query Only)
Returns the decimal values of the received packet VHT-SIGNAL(A) symbols fields.

Available only for 802.11ac.

Conditions
Measurement view: WLAN

This command requires WLAN Measurements

Group
Fetch commands

Syntax
```
FETCh:WLAN:SUMMary:VHTSig:A?
```

Arguments
None

Returns
Results are returned in the same left-to-right order in which they are presented in the display.

FETCh:WLAN:SUMMary:VHTSig:B? (Query Only)
Returns the decimal values of the received packet VHT-SIGNAL(B) symbols fields.

Available only for 802.11ac.

Conditions
Measurement view: WLAN

This command requires WLAN Measurements

Group
Fetch commands

Syntax
```
FETCh:WLAN:SUMMary:VHTSig:B?
```

Arguments
None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

*IDN? (Query Only)

Returns the analyzer identification code.

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

```
*IDN?
```

Arguments

None

Returns

The analyzer identification code in the following format

`TEKTRONIX,RSAXXXXX,<serial_number>,<firmware_version>`

Where

`TEKTRONIX` indicates that the manufacturer is Tektronix.

`RSAXXXXX` is the model number (RSA5103B, RSA5106B, RSA5115B, or RSA5126B).

`<serial_number>` is the serial number.

`<firmware_version>` is the firmware version.

Examples

`*IDN?` might return the response

`TEKTRONIX,RSA5126B,B000111,FV2.6.1500`

INITiate:CONTinuous

Determines whether to place the analyzer in the single or the continuous acquisition mode.

Conditions

Measurement views: All

Group

Initiate commands

Syntax

```
INITiate:CONTinuous { OFF | ON | 0 | 1 }
INITiate:CONTinuous?
```

Related Commands

INITiate:RESume (on page 1531)

INITiate[:IMMediate] (on page 1531)

Arguments

OFF or 0 places the analyzer in the single acquisition mode. To initiate the acquisition, use the INITiate[:IMMediate] command. To stop acquisition when a trigger is not present, and to avoid a 2.7 hour time-out, send the free-run trigger command, TRIGger:SEQuence:STATus 0. Then, send the command INITiate:CONTinuous OFF. This sequence ensures a minimal delay before the INIT:CONT OFF command completes.

ON or 1 places the analyzer in the continuous acquisition mode. To initiate the acquisition, use the INITiate[:IMMediate] command. To stop the acquisition in the continuous mode, send the following command: INITiate:CONTinuous OFF

Returns

See Arguments.

Examples

INITIATE:CONTINUOUS ON places the analyzer in the continuous acquisition mode.

INITiate[:IMMediate] (No Query Form)

Starts input signal acquisition.

NOTE: It is an overlapped command, which does not finish executing before the next command starts executing. Use the *OPC(?) and *WAI commands to synchronize all pending operations to the execution of this command.

Conditions

Measurement views: All

Group

Initiate commands

Syntax

INITiate[:IMMediate]

Related Commands

*OPC (on page 1594)

*TRG (on page 2757)

*WAI (on page 2795)

INITiate:CONTinuous (on page 1530)

Arguments

None

Examples

INITIATE:IMMEDIATE starts input signal acquisition.

INITiate:RESume (No Query Form)

Restarts signal processing.

Resume is only applicable when FastFrame is enabled, and when the instrument is stopped while analyzing the frames. When the instrument is stopped, measurements will finish processing and the system might stop before all of the frames of an acquisition are processed (when acquisition is stopped, the system stops as soon as all measurements say they are finished processing the current acquisition). However, the instrument saves all of the frames to the Acquisition History (Data Cache), and when INITiate:RESume is sent, it will begin processing at the first frame of the last acquisition that was not processed (the one after the last frame processed), and process all of these remaining frames before starting a new acquisition. If INITiate is sent instead, any remaining frames are discarded and a new acquisition is started immediately. If FastFrame is off, or there are no remainder frames, or the acquisition was aborted rather than stopped, then INITiate:RESume and INITiate are the same.

Conditions

Measurement views: All

FastFrame enabled

Group

Initiate commands

Syntax

```
INITiate:RESume
```

Related Commands

*OPC (on page 1594)

*TRG (on page 2757)

*WAI (on page 2795)

INITiate:CONTinuous (on page 1530)

INITiate[:IMMediate] (on page 1531)

Arguments

None

Examples

INITIATE:RESUME (on page 1531) restarts input signal acquisition.

Input commands

INPut:CORRection:EXTernal:EDIT<x>:INTerpolation

Sets or queries the interpolation setting to use with the indicated external gain table.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:EDIT<x>:INTerpolation { LINear | LOGarithmic }
INPut:CORRection:EXTernal:EDIT<x>:INTerpolation
```

Related Commands

INPut:CORRection:EXTernal:EDIT<x>:NEW (on page 1533)

Arguments

`LINear` select when the frequency scale of the spectrum or spurious measurements are linear.

`LOGarithmic` select when the frequency scale of the spectrum is logarithmic.

Examples

`INPut:CORRection:EXTernal:EDIT1:INTerpolation LINear` uses linear interpolation when applying External correction Table one (1) to the chosen waveforms.

INPut:CORRection:EXTernal:EDIT<x>:LABel

Sets or queries the name of the external loss table.

The parameter <x> = 1 to 3 represent the External Loss Table 1 to 3, respectively.

NOTE: This command has replaced `CALIbration:CORRection:EXTernal:EDIT<x>:LABEL`

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:EDIT<x>:LABel name
INPut:CORRection:EXTernal:EDIT<x>:LABel?
```

Arguments

`name::=<string>` specifies the name of the external loss table.

Examples

`INPut:CORRection:EXTernal:EDIT<x>:LABel 'Sample Table 1'` names the External Loss Table 1 "Sample Table 1".

INPut:CORRection:EXTernal:EDIT<x>:NEW

Creates the indicated external loss table from a series of frequency and gain value pairs.

NOTE: This command has replaced `CALIbration:CORRection:EXTernal:EDIT<x>:NEW`

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:EDIT<x>:NEW
   <freq(1)>,<gain(1)>,<freq(2)>,<gain(2)>,...,<freq(n)>,<gain(n)>
```

```
INPut:CORRection:EXTernal:EDIT<x>:NEW?
```

Related Commands

INPut:CORRection:EXTernal:TYPE (on page 1536)

Arguments

`<freq(n)>,<gain(n)>` specifies a pair of frequency (`<NR3>` in Hz) and gain (+ | −`<NR3>` in dB) in the external correction table.

NOTE: Do not include a unit suffix (such as Hz, dBm, or dB) with the arguments for this command.

The setting range is:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Loss: -50 to +30 dB. Negative values indicate loss and positive values indicate gain. Resolution is 0.1 dB.

Examples

`INPut:CORRection:EXTernal:EDIT?:NEW` 1.0E+9,-2.2,-1.5E+9,–2.3 creates the External correction Table specifying a loss of 2.2 dB at 1 GHz and a loss of 2.3 dB at 1.5 GHz.

INPut:CORRection:EXTernal:EDIT<x>:STATe

Determines whether to enable or disable the external loss table.

The parameter <x> = 1 to 3 represent the External Loss Table 1 to 3, respectively.

NOTE: This command has replaced `CALIbration:CORRection:EXTernal:EDIT<x>:STATe`

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:EDIT<x>:STATe { OFF | ON | 0 | 1 }
INPut:CORRection:EXTernal:EDIT<x>:STATe?
```

Arguments

`OFF` or `0` disables the external loss table.

`ON` or `1` enables the external loss table.

NOTE: You can enable one or more tables at the same time.

Examples

`INPut:CORRection:EXTernal:EDIT3:STATe?` ON enables the External Loss Table 3.

INPut:CORRection:EXTernal:GAIN[:MAGNitude]

Sets or queries the external gain value. It can be enabled or disabled using the `INPut:CORRection:EXTernal:GAIN:STATe` command.

NOTE: This command has replaced `CALIbration:CORRection:EXTernal:GAIN[:MAGNitude]`

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:GAIN[:MAGNitude] <value>
INPut:CORRection:EXTernal:GAIN[:MAGNitude]?
```

Arguments

`<value>::=<NRf>` specifies the external gain value. Range: -50 to +30 dB.

Examples

`INPut:CORRection:EXTernal:GAIN[:MAGNitude] <value>` -10 sets the external gain to -10 dB.

INPut:CORRection:EXTernal:GAIN:STATe

Determines whether to enable or disable the external gain value.

NOTE: This command has replaced `CALIbration:CORRection:EXTernal:GAIN:STATe`.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:GAIN:STATe { OFF | ON | 0 | 1 }
INPut:CORRection:EXTernal:GAIN:STATe?
```

Related Commands

INPut:CORRection:EXTernal:GAIN[:MAGNitude] (on page 1535)

Arguments

OFF or 0 disables the external gain value.

ON or 1 enables the external gain value.

Examples

`INPut:CORRection:EXTernal:GAIN:STATe ON` enables the external gain value.

INPut:CORRection:EXTernal:TYPE

Sets or queries the data type to use when applying the external loss table corrections.

NOTE: This command has replaced `CALIbration:CORRection:EXTernal:TYPE`.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:CORRection:EXTernal:TYPE { TRACe | DATA }
INPut:CORRection:EXTernal:TYPE
```

Related Commands

INPut:CORRection:EXTernal:EDIT<x>:NEW (on page 1533)

Arguments

`TRACe` selects traces in the Spectrum, Spectrogram, Spurious, and Amplitude versus Time views. Selecting `TRACe` disables the `INPut:CORRection:EXTernal:GAIN:STATe` command.

`DATA` selects all acquired data. Selecting `DATA` enables the `INPut:CORRection:EXTernal:GAIN:STATe` command.

Examples

`INPUT:CORRECTION:EXTERNAL:TYPE TRACe` selects traces to apply the external loss table corrections.

INPut:{MLEVel|RLEVel}

Sets or queries the reference level.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut:{MLEVel|RLEVel} <value>
INPut:{MLEVel|RLEVel}?
```

Arguments

`<value>::<NRf>` specifies the reference level. Range: -170 to +50 dBm.

Examples

`INPUT:RLEVEL` -10 sets the reference level to -10 dBm.

INPut[:RF]:ATTenuation

Sets or queries the input attenuation. Programming a specified attenuation sets `INPut[:RF]:ATTenuation:AUTO` OFF.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut[:RF]:ATTenuation <value>
INPut[:RF]:ATTenuation?
```

Related Commands

INPut[:RF]:ATTenuation:AUTO (on page 1537)

Arguments

`<value>::<NR1>` specifies the input attenuation.

Range: 0 to 75 dB in 5 dB steps.

Examples

`INPUT:RF:ATTENUATION 20` sets the input attenuation to 20 dB.

INPut[:RF]:ATTenuation:AUTO

Determines whether to set the input attenuation automatically or manually.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut[:RF]:ATTenuation:AUTO { OFF | ON | 0 | 1 }
INPut[:RF]:ATTenuation:AUTO?
```

Arguments

`OFF` or 0 specifies that the input attenuation is set manually. To set it, use the `INPut[:RF]:ATTenuation` command.

`ON` or 1 specifies that the input attenuation is set automatically according to the reference level.

Examples

`INPUT:RF:ATTENUATION:AUTO ON` specifies that the input attenuation is set automatically.

INPut[:RF]:ATTenuation:MONitor:STATe

Determines whether to enable or disable to monitor attenuator use.

Conditions

Measurement views: All

Group

Input commands

Syntax

```
INPut[:RF]:ATTenuation:MONitor:STATe { OFF | ON | 0 | 1 }
INPut[:RF]:ATTenuation:MONitor:STATe?
```

Arguments

`OFF` or `0` disables to monitor attenuator use.

`ON` or `1` enables to monitor attenuator use.

Examples

`INPUT:RF:ATTENUATION:MONITOR:STATE ON` enables to monitor attenuator use.

INPut[:RF]:GAIN:STATe

Determines whether to enable or disable the internal preamp.

Conditions

Measurement views: All (Option 50 or 51 only)

Group

Input commands

Syntax

```
INPut[:RF]:GAIN:STATe { OFF | ON | 0 | 1 }
INPut[:RF]:GAIN:STATe?
```

Arguments

`OFF` or `0` disables the internal preamp.

`ON` or `1` enables the internal preamp.

Examples

`INPUT:RF:GAIN:STATE ON` enables the internal preamp.

INPut:TYPE

Sets or queries the source type.

Condition

Measurement views: All

Group

Input commands

Syntax

```
INPut:TYPE <value> {RFSDdc | RFBSm | RF | IQ | DIFFiq}
INPut:TYPE?
```

Arguments

`<value>::<NRf>` specifies the source type.

Examples

`INPUT:TYPE RF` will set the source type to RF.

Memory commands

MMEMory:{AM|FM|PM}:LOAD:TRACe (No Query Form)

Loads the AM/FM/PM measurement trace data from the specified file.

Conditions

Measurement views: AM, FM, PM

Group

Mass Memory commands

Syntax

```
MMEMory:{AM|FM|PM}:LOAD:TRACe <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.The file extension is .AmVsTime (AM), .FmVsTime (FM), or .PmVsTime (PM). You can omit the extension.

Examples

`MMEMORY:AM:LOAD:TRACE "Sample1"` loads the trace data from the *Sample1.AmVsTime* file in the AM measurement.

MMEMory:{AM|FM|PM}:SHOW:TRACe<x>

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: AM, FM, PM

Group

Mass Memory commands

Syntax

```
MMEMory:{AM|FM|PM}:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:{AM|FM|PM}:SHOW:TRACe<x>?
```

Related Commands

MMEMory:{AM|FM|PM}:LOAD:TRACe (on page 1539)

Arguments

`OFF` or 0 disables display of the recalled trace.

`ON` or 1 enables display of the recalled trace.

Examples

`MMEMORY:FM:SHOW:TRACE2 ON` enables display of the recalled data loaded in Trace2.

MMEMory:{AM|FM|PM}:STORe:TRACe (No Query Form)

Stores the AM/FM/PM measurement trace data in the specified file.

Conditions

Measurement views: AM, FM, PM

Group

Mass Memory commands

Syntax

`MMEMory:{AM|FM|PM}:STORe:TRACe <file_name>`

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.The file extension is .AmVsTime (AM), .FmVsTime (FM), or .PmVsTime (PM). You can omit the extension.

Examples

`MMEMORY:AM:STORE:TRACE "Sample1"` stores the trace data in the *Sample1.AmVsTime* file in the AM measurement.

MMEMory:AUDio:LOAD:FILTer (No Query Form)

Loads a user-defined audio filter from the specified file.

Conditions

Measurement views: Audio Spectrum

Group

Mass Memory commands

Syntax

`MMEMory:AUDio:LOAD:FILTer <file_name>`

Related Commands

[SENSe]:AUDio:FILTer:SOURce? (on page 2021)

Arguments

`<file_name> ::= <string>` specifies the filter file to load.

Examples

`MMEMORY:AUDIO:LOAD:FILTER "filter4"` loads the user-defined filter4 file for the measurement.

MMEMory:AVTime[:MEASview<y>]:LOAD:TRACe<x> (No Query Form)

Loads the Amplitude versus Time trace data from the specified file. The parameter `<x>` = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:AVTime[:MEASview<y>]:LOAD:TRACe<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.The file extension is .AmplVsTime. You can omit the extension.

The parameter `<x>` = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:AVTIME:MEASVIEW1:LOAD:TRACE1 "Sample1"` loads Trace 1 data on Amplitude versus Time Measurement View 1 from the *Sample1.AmplVsTime* file.

MMEMory:AVTime[:MEASview<y>]:SHOW:TRACe<x>

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: Amplitude versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:AVTime[:MEASview<y>]:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:AVTime[:MEASview<y>]:SHOW:TRACe<x>?
```

Related Commands

MMEMory:AVTime[:MEASview<y>]:LOAD:TRACe<x> (on page 1540)

Arguments

`OFF` or `0` disables display of the recalled trace.

`ON` or `1` enables display of the recalled trace.

The parameter `<x>` = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:AVTIME:MEASVIEW1:SHOW:TRACE2 ON` enables display of the recalled data loaded in Trace2 from Amplitude versus Time Measurement View 1.

MMEMory:AVTime[:MEASview<y>]:STORe:PLOT

Stores the Amplitude versus Time trace data in the specified file. The parameter <x> = 1 to 4; All traces are valid.

Conditions

Measurement views: Amplitude versus Time

Group

Mass Memory commands

Syntax

`MMEMory:AVTime[:MEASview<y>]:STORe:PLOT<file_name>`

Arguments

`<file_name>::<string>` specifies the file in which to store trace data.The file extension is .AmplVsTime. You can omit the extension.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:AVTIME:MEASVIEW1:STORE:PLOT "Sample1"` stores Trace 1 data from Amplitude versus Time Measurement View 1 in the *Sample1.AmplVsTime* file.

MMEMory:AVTime[:MEASview<y>]:STORe:PLOT:DONe

Stores the Amplitude versus Time trace data in the specified file. The parameter <x> = 1 to 4; All traces are valid.

Conditions

Measurement views: Amplitude versus Time

Group

Mass Memory commands

Syntax

`MMEMory:AVTime[:MEASview<y>]:STORe:PLOT:DONe <file_name>`

Arguments

`<file_name>::<string>` specifies the file in which to store trace data.The file extension is .AmplVsTime. You can omit the extension.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:AVTIME:MEASVIEW1:STORE:PLOT:DONE "Sample1"` stores Trace 1 data from Amplitude versus Time Measurement View 1 in the *Sample1.AmplVsTime* file.

MMEMory:AVTime[:MEASview<y>]:STORe:TRACe<x> (No Query Form)

Stores the Amplitude versus Time trace data in the specified file. The parameter <x> = 1 to 4; All traces are valid.

Conditions

Measurement views: Amplitude versus Time

Group

Mass Memory commands

Syntax

`MMEMory:AVTime[:MEASview<y>]:STORe:TRACe<x> <file_name>`

Arguments

`<file_name>::<string>` specifies the file in which to store trace data.The file extension is .AmplVsTime. You can omit the extension.

The parameter `<x>` = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:AVTIME:MEASVIEW1:STORE:TRACE1 "Sample1"` stores Trace 1 data from Amplitude versus Time Measurement View 1 in the *Sample1.AmplVsTime* file.

MMEMory:CALibration:LOAD:CORRection:EXTernal:EDIT<x> (No Query Form)

Loads the external loss table from a specified file.

The parameter `<x>` = 1 to 3 represent External Loss Table 1 to 3, respectively.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:CALibration:LOAD:CORRection:EXTernal:EDIT<x> <file_name>`

Arguments

`<file_name>::<string>` specifies the file to load the external loss table from.The file extension is .csv. You can omit the extension.

Examples

`MMEMORY:CALIBRATION:LOAD:CORRECTION:EXTERNAL:EDIT1 "Table1"` loads the External Loss Table 1 from the *Table1.csv* file.

MMEMory:CALibration:STORe:CORRection:EXTernal:EDIT<x> (No Query Form)

Stores the external loss table to a specified file.

The parameter `<x>` = 1 to 3 represent External Loss Table 1 to 3, respectively.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

```
MMEMory:CALibration:STORe:CORRection:EXTernal:EDIT<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file to store the external loss table to.The file extension is .csv. You can omit the extension.

Examples

`MMEMORY:CALIBRATION:STORE:CORRECTION:EXTERNAL:EDIT1 "Table1"` stores the External Loss Table 1 to the *Table1.csv* file.

MMEMory:CCDF:LOAD:TRACe<x> (No Query Form)

Loads the CCDF trace data from the specified file.

Conditions

Measurement views: CCDF

Group

Mass Memory commands

Syntax

```
MMEMory:CCDF:LOAD:TRACe<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.The file extension is .CCDF. You can omit the extension.

Examples

`MMEMORY:CCDF:LOAD:TRACE1 "Sample1"` loads Trace 1 data from the *Sample1.CCDF* file.

MMEMory:CCDF:SHOW:TRACe<x>

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: CCDF

Group

Mass Memory commands

Syntax

```
MMEMory:CCDF:SHOW:TRACe<x> { OFF | ON | 0 | 1 } MMEMory:CCDF:SHOW:TRACe<x>?
```

Related Commands

MMEMory:CCDF:LOAD:TRACe<x> (on page 1544)

Arguments

OFF or 0 disables display of the recalled trace.

ON or 1 enables display of the recalled trace.

Examples

MMEMORY:CCDF:SHOW:TRACE2 ON enables display of the recalled data loaded in Trace2.

MMEMory:CCDF:STORe:TRACe<x> (No Query Form)

Stores the CCDF trace data in the specified file.

Conditions

Measurement views: CCDF

Group

Mass Memory commands

Syntax

MMEMory:CCDF:STORe:TRACe<x> <file_name>

Arguments

<file_name>::<string> specifies the file in which to store trace data.The file extension is .CCDF. You can omit the extension.

Examples

MMEMORY:CCDF:STORE:TRACE1 "Sample1" stores Trace 1 data in the *Sample1.CCDF* file.

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:MEASurement:UOTHer (No query form)

Loads a user-defined measurement filter from the specified file of the measurement source.

Group

Mass Memory commands

Syntax

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:MEASurement:UOTHer <file_name>

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence (on page 2083)

[SENSe]:DDEMod[:SOURce<x>]:FILTer:MEASurement (on page 2082)

Arguments

<x> = 1 to 8, representing Range of Source.

<file_name>::<string> specifies the filter file to load.

Examples

MMEMORY:DDEMOD:SOURCE1:LOAD:FILTER:MEASUREMENT:UOTHER "Table2" loads User other filter from the file Table2.csv of the measurement source 1.

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:MEASurement:USER<y> (No query form)

Loads the user-defined measurement filter from the specified file of the measurement source. The parameter <y> specifies one of the User Meas Filters 1 to 3. The filter file must have a .csv file extension, though you may omit the file extension in the command line.

Group

Mass Memory commands

Syntax

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:MEASurement:USER<y> <file_name>

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence (on page 2083)

[SENSe]:DDEMod[:SOURce<x>]:FILTer:MEASurement (on page 2082)

Arguments

<x> = 1 to 8, representing Range of Source.

<file_name>::<string> specifies the filter file to load.

Examples

MMEMORY:DDEMOD:SOURCE1:LOAD:FILTER:MEASUREMENT:USER1 "Table1" loads User Meas Filter 1 from the file Table1.csv of the measurement source 1.

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:REFerence:UOTHer (No query form)

Loads the specified user-defined reference filter, UOTHer, from a specified file of the measurement source.

Group

Mass Memory commands

Syntax

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:REFerence:UOTHer <file_name>

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence (on page 2083)

[SENSe]:DDEMod[:SOURce<x>]:FILTer:MEASurement (on page 2082)

Arguments

<x> = 1 to 8, representing Range of Source.

<file_name>::<string> specifies the reference filter file to load. The file extension is type .csv.

Examples

`MMEMORY:DDEMOD:SOURCE1:LOAD:FILTER:REFERENCE:UOTHER "FinalFilt"` loads the filter file `FinalFilt.csv` into the filter reference UOTHER of the measurement source 1.

MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:REFerence:USER<y> (No query form)

Loads the specified user-defined reference filter, USER1 | 2 | 3 from a specified file of the measurement source.

Group

Mass Memory commands

Syntax

`MMEMory:DDEMod[:SOURce<x>]:LOAD:FILTer:REFerence:USER<y> <file_name>`

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence (on page 2083)

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<file_name>::<string>` specifies the reference filter file to load. The file extension is type .csv.

Examples

`MMEMORY:DDEMOD:SOURCE1:LOAD:FILTER:REFERENCE:USER2 "DUTFilt2"` loads the filter file *DUTfilt2.csv* into the filter reference USER2 of the measurement source 1.

MMEMory:DDEMod[:SOURce<x>]:LOAD:SYMBol:MAP (No query form)

Loads the specified symbol map filename of the measurement source. The setting correlates to the field, User Symbol Map (per Modulation Type) on the Advanced Params tab in the Digital Modulation settings.

Group

Mass Memory commands

Syntax

`MMEMory:DDEMod[:SOURce<x>]:LOAD:SYMBol:MAP <file_name>`

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE (on page 2087)

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<file_name>::<string>` specifies the symbol map file to load. The file extension is type .txt.

Examples

`MMEMORY:DDEMOD:SOURCE1:LOAD:SYMBOL:MAP "C:\usymmap.txt"` identifies the file to load for the symbol map of the measurement source 1.

MMEMory:DPX:LOAD:TRACe<x> (No Query Form)

Loads the DPX spectrum trace data from the specified file.

The parameter <x> = 1, 2, 3, or 5; TRACe4 (math trace) is invalid.

Conditions

Measurement views: DPX spectrum

Group

Mass Memory commands

Syntax

```
MMEMory:DPX:LOAD:TRACe<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data. The file extension is .dpt. You can omit the extension.

Examples

`MMEMORY:DPX:LOAD:TRACE1 "Sample1"` loads Trace 1 data from the *Sample1.dpt* file.

MMEMory:DPX:SHOW:TRACe<x>

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: DPX spectrum

Group

Mass Memory commands

Syntax

```
MMEMory:DPX:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:DPX:SHOW:TRACe<x>?
```

Related Commands

MMEMory:DPX:LOAD:TRACe<x> (on page 1548)

Arguments

`OFF` or 0 disables display of the recalled trace.

`ON` or 1 enables display of the recalled trace.

Examples

`MMEMORY:DPX:SHOW:TRACE2 ON` enables display of the recalled data loaded in Trace2.

MMEMory:DPX:STORe:TRACe<x>

Stores the DPX spectrum trace data in the specified file. The parameter <x> = 1 to 5; All traces are valid.

Conditions

Measurement views: DPX spectrum

Group

Mass Memory commands

Syntax

`MMEMory:DPX:STORe:TRACe<x> <file_name>`

Arguments

`<file_name>::<string>` specifies the file in which to store trace data.The file extension is .dpt. You can omit the extension.

Examples

`MMEMORY:DPX:STORE:TRACE1 "Sample1"` stores Trace 1 data in the *Sample1.dpt* file.

MMEMory:DPX:TDM:FREQuency:TXBer:LOAD:PATTern (No Query Form)

Loads the Tx BER User data pattern from the specified file.

Conditions

Measurement views: DPX:Frequency

Group

Mass Memory commands

Syntax

`MMEMory:DPX:TDM:FREQuency:TXBer:LOAD:PATTern <file_name>`

Related Commands

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern (on page 2120)

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REPeat (on page 2121)

Arguments

`<file_name>::<string>` that specifies the file (path) from which to load the User data pattern. The file type containing the data pattern must be in CSV format. See the instrument Help for details on creating a user pattern file.

Examples

`MMEMORY:DPX:TDM:FREQUENCY:TXBER:LOAD:PATTERN "C:\RSA5100B Files\Example Files\SampleUserPattern.csv"` loads the user pattern defined in *SampleUserPattern.csv*.

MMEMory:EMC:ACCEssory<x>:LOAD:TABLe (No Query Form)

Loads the loss table of the specified accessory from the specified file in the EMC view.

`<x>` = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:ACCEssory<x>:LOAD:TABLe <file name>`

Arguments

`<file name> = <String>` specifies the file to load the loss table with extension as .emcemi

Returns

None

Examples

`MMEMory:EMC:ACCEssory1:LOAD:TABLe "C:\SignalVu-PC Files\table.csv"` loads the loss table for accessory 1 from the table *.csv* file.

MMEMory:EMC:ACCEssory<x>:STORe:TABLe (No Query Form)

Stores the loss table of the specified accessory into the specified file in the EMC view.

`<x>` = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:ACCEssory<x>:STORe:TABLe <file name>`

Arguments

`<file name> = <String>` specifies the file to store the loss table with extension as .csv

Returns

None

Examples

`MMEMory:EMC:ACCEssory2:STORe:TABLe "C:\SignalVu-PC Files\sample.csv"` stores the loss table for the accessory 2 in the sample.csv file.

MMEMory:EMC:AMBient:TRACe:FILE (No Query Form)

Recalls the ambient trace from the file in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:AMBIent:TRACe:FILE <file name>`

Arguments

`<file name> = <String>` specifies the file with extension as .emcemi to recall the ambient trace.

Returns

None

Examples

`MMEMORY:EMC:AMBIENT:TRACE:FILE "C:\SignalVu-PC Files\ambient.emcemi"` recalls the ambient trace from the ambient.emcemi file.

MMEMory:EMC:AMBIent:TRACe:SHOW (No Query Form)

Sets or queries to enable or disable show recalled trace checkbox of ambient trace in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

```
MMEMory:EMC:AMBIent:TRACe:SHOW {0 | OFF | 1 | ON}
MMEMory:EMC:AMBIent:TRACe:SHOW?
```

Arguments

`0` or OFF disable the show recalled trace check box of ambient trace

`1` or ON enable the show recalled trace check box of ambient trace

Returns

`<Boolean>` 0,1

Examples

`MMEMORY:EMC:AMBIENT:TRACE:SHOW?` might return `1`, indicating that the show recalled trace check box of ambient trace is enabled.

MMEMory:EMC:AMBIent:TRACe:STORe (No Query Form)

Stores the ambient trace into the specified file in the EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:AMBIent:TRACe:STORe <file name>`

Arguments

`<file name> = <String>` specifies the file to store the ambient trace with extension as .emcemi

Returns

None

Examples

`MMEMORY:EMC:AMBIENT:TRACE:STORE "C:\SignalVu-PC Files\ambient.emcemi"` stores the ambient trace in the ambient.emcemi file.

MMEMory:EMC:MATH:TRACe:FILE (No Query Form)

Recalls the math trace from the file in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

```
MMEMory:EMC:MATH:TRACe:FILE <file name>
```

Arguments

`<file name> = <String>` specifies the file with extension as .emcemi to recall the math trace.

Returns

None

Examples

`MMEMORY:EMC:MATH:TRACE:FILE "C:\SignalVu-PC Files\math.emcemi"` recalls the math trace from the math.emcemi file.

MMEMory:EMC:MATH:TRACe:SHOW

Sets or queries to enable and disable the show recalled trace check box of math trace in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

```
MMEMory:EMC:MATH:TRACe:SHOW {0 | OFF | 1 | ON}
MMEMory:EMC:MATH:TRACe:SHOW?
```

Arguments

`0` or OFF disable the show recalled trace check box of math trace

1 or ON enable the show recalled trace check box of math trace

Returns

<Boolean> 0,1

Examples

MMEMORY:EMC:MATH:TRACE:SHOW might return 0, indicating that show recalled trace check box of math trace is disabled.

MMEMory:EMC:MATH:TRACe:STORe (No Query Form)

Stores the math trace into the specified file in the EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

```
Syntax
MMEMory:EMC:MATH:TRACe:STORe <file name>
```

Arguments

<file name> = <String> specifies the file to store the math trace with extension as .emcemi

Returns

None

Examples

MMEMORY:EMC:MATH:TRACE:STORE "C:\SignalVu-PC Files\math.emcemi" stores the math trace in the math.emcemi file.

MMEMory:EMC:RANGe:LOAD:TABLe (No Query Form)

Loads the Ranges table from the specified file in the EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

```
MMEMory:EMC:RANGe:LOAD:TABLe <file name>
```

Arguments

<file name> = <String> specifies the file to load the range table with extension as .csv

Returns

None

Examples

`MMEMORY:EMC:RANGE:LOAD:TABLE "C:\SignalVu-PC Files\table.csv"` loads the ranges table from the table.csv file.

MMEMory:EMC:RANGe:STORe:TABLe (No Query Form)

Stores the Ranges table into the specified file in the EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:RANGe:STORe:TABLe <file name>`

Arguments

`<file name> = <String>` specifies the file to store the range table with extension as .csv

Returns

None

Examples

`MMEMORY:EMC:RANGE:STORE:TABLE "C:\SignalVu-PC Files\sample.csv"` stores the ranges table in the sample.csv file.

MMEMory:EMC:RECAll:TRACe<x>:FILE (No Query Form)

Recalls the specified trace from the file in EMC view.

<x> = <NR1> Either 1,2,3,4,5 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

`Syntax`
`MMEMory:EMC:RECAll:TRACe<x>:FILE <file name>`

Arguments

`<file name> = <String>` specifies the file with extension as .emcemi to recall the trace.

Returns

None

Examples

`MMEMory:EMC:RECAll:TRACe1:FILE "C:\SignalVu-PC Files\sampletrace.emcemi"` recalls the trace 1 from the sampletrace.emcemi file.

MMEMory:EMC:RECAll:TRACe<x>:SHOW (No Query Form)

Sets or queries to show or hide the specified recalled trace in EMC view.

<x> = <NR1> Either 1,2,3,4,5 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

```
MMEMory:EMC:RECAll:TRACe<x>:SHOW {0 | OFF | 1 | ON}
MMEMory:EMC:RECAll:TRACe<x>:SHOW?
```

Arguments

`0` or OFF disables the show check box and hides the recalled trace

`1` or ON enables the show check box and displays the recalled trace

Returns

`<Boolean>` 0,1

Examples

`MMEMory:EMC:RECAll:TRACe2:SHOW` might return `0`, indicating recalled trace 2 is hidden.

MMEMory:EMC:REPOrt:GENerate:FINAl (No Query Form)

Generates the report and saves the report file in the specified format under specified location in EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

```
MMEMory:EMC:REPOrt:GENerate:FINAl <file_name>
```

Arguments

`<file name> = <String>` specifies the file and format to store the report.

Returns

None

Examples

`MMEMORY:EMC:REPORT:GENERATE:FINAL "C:\SignalVu-PC Files\report.pdf"` generates and stores the report in pdf format with file named report.pdf.

MMEMory:EMC:REPOrt:HISTory:DELete:ALL (No Query Form)

Deletes all the saved test results in history list of report setup in EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:REPOrt:HISTory:DELete:ALL`

Arguments

None

Returns

None

Examples

`MMEMORY:EMC:REPORT:HISTORY:DELETE:ALL` deletes all the saved test results in the history list of report setup.

MMEMory:EMC:REPOrt:SAVE:RUN (No Query Form)

Saves the test results and adds to the history list of report setup in EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:REPOrt:SAVE:RUN`

Arguments

None

Returns

None

Examples

`MMEMORY:EMC:REPORT:SAVE:RUN` saves the test results and adds to the history list.

MMEMory:EMC:SCAN:TRACe<x>:STORe (No Query Form)

Stores the specified live scan trace into the specified file in the EMC view.

<x> = <NR1> Trace number

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:SCAN:TRACe<x>:STORe <file name>`

Arguments

`<file name> = <String>` specifies the file to store the scan trace with extension as .emcemi

Returns

None

Examples

`MMEMory:EMC:SCAN:TRACe1:STORe "C:\SignalVu-PC Files\sample.emcemi"` stores the scan trace 1 in the sample.emcemi file.

MMEMory:EMC:SPOT:TRACe<x>:STORe (No Query Form)

Stores the specified live spot trace into the specified file in the EMC view.

<x> = <NR1> Trace number

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

`MMEMory:EMC:SPOT:TRACe<x>:STORe <file name>`

Arguments

`<file name> = <String>` specifies the file to store the spot trace with extension as .emcemi

Returns

None

Examples

`MMEMory:EMC:SPOT:TRACe2:STORe "C:\SignalVu-PC Files\trace.emcemi"` stores the spot trace 2 in the trace.emcemi file.

[MMEMory:{FSETtling|PSETtling}:LOAD:TRACe<x>

Loads the Frequency or Phase Settling Time trace data from the specified file. The parameter <x> = 1 or 2; only Trace1 and Trace2 are used for settling time measurements.

Conditions

Measurement views: Frequency or Phase Settling

Group

Mass Memory commands

Syntax

```
[MMEMory:{FSETtling|PSETtling}:LOAD:TRACe<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.

Examples

`MMEMORY:PSETTLING:LOAD:TRACE1 "Wfm1"` loads Trace1 data from the Wfm1 file.

[MMEMory:{FSETtling|PSETtling}:SHOW:TRACe<x>

Enables display of a recalled Frequency or Phase Settling trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Trace control panel.

Conditions

Measurement views: Frequency and Phase Settling

Group

Mass Memory commands

Syntax

```
[MMEMory:{FSETtling|PSETtling}:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
[MMEMory:{FSETtling|PSETtling}:SHOW:TRACe<x>?
```

Related Commands

[MMEMory:{FSETtling|PSETtling}:LOAD:TRACe<x> (on page 1557)

Arguments

`OFF` or 0 disables display of the recalled trace.

`ON` or 1 enables display of the recalled trace.

Examples

`MMEMORY:PSETTLING:SHOW:TRACE1 ON` enables display of the recalled data loaded in Trace1.

[MMEMory:{FSETtling|PSETtling}:STORe:TRACe<x>

Stores the Frequency or Phase Settling trace data in the specified file. The parameter <x> = 1 or 2; only Trace1 and Trace2 are used for Frequency and Phase Settling.

Conditions

Measurement views: Phase noise

Group

Mass Memory commands

Syntax

```
[MMEMory:{FSETtling|PSETtling}:STORe:TRACe<x> <file_name>
```

Arguments

<file_name>::<string> specifies the file in which to store trace data.

Examples

MMEMORY:PNOISE:STORE:TRACE1 "TRACE1" stores Trace 1 data in the TRACE1 file.

MMEMory:FVTime[:MEASview<y>]:LOAD:TRACe (No Query Form)

Loads the Frequency versus Time trace data from the specified file.

Conditions

Measurement views: Frequency versus Time

Group

Mass Memory commands

Syntax

MMEMory:FVTime[:MEASview<y>]:LOAD:TRACe <file_name>

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<file_name>::<string> specifies the file from which to load trace data.The file extension is .FreqVsTime. You can omit the extension.

Examples

MMEMORY:FVTIME:MEASview1:LOAD:TRACE"Sample1" loads the Frequency versus Time trace data from the *Sample1.FreqVsTime* file.

MMEMory:FVTIME[:MEASview<y>]:SHOW:TRACe<x>

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: Frequency versus Time

Group

Mass Memory commands

Syntax

MMEMory:FVTIME[:MEASview<y>]:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:FVTIME:SHOW:TRACe<x>?

Related Commands

MMEMory:FVTime[:MEASview<y>]:LOAD:TRACe (on page 1559)

Arguments

OFF or 0 disables display of the recalled trace.

ON or 1 enables display of the recalled trace.

Examples

MMEMORY:FVTIME:MEASview1:SHOW:TRACE2 ON enables display of the recalled data loaded in Trace2.

MMEMory:FVTime[:MEASview<y>]:STORe:TRACe (No Query Form)

Stores the Frequency versus Time trace data in the specified file.

Conditions

Measurement views: Frequency versus Time

Group

Mass Memory commands

Syntax

MMEMory:FVTime[:MEASview<y>]:STORe:TRACe <file_name>

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<file_name>::<string> specifies the file in which to store trace data.The file extension is .FreqVsTime. You can omit the extension.

Examples

MMEMORY:FVTIME:MEASview1:STORE:TRACE"Sample1" stores the Frequency versus Time trace data in the *Sample1.FreqVsTime* file.

MMEMory:IQVTime[:MEASVIEW<y>]:LOAD:TRACe:I (No Query Form)

Loads I trace data from the specified file.

Conditions

Measurement views: RF I&Q versus Time

Group

Mass Memory commands

Syntax

MMEMory:IQVTime[:MEASVIEW<y>]:LOAD:TRACe:I <file_name>

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<file_name>::<string> specifies the file from which to load trace data.The file extension is .RFIQVsTime. You can omit the extension.

Examples

MMEMORY:IQVTIME:MEASVIEW1:LOAD:TRACE:I "Sample1" loads the I trace data from the *Sample1.RFIQVsTime* file.

MMEMory:IQVTime[:MEASVIEW<y>]:LOAD:TRACe:Q (No Query Form)

Loads Q trace data from the specified file.

Conditions

Measurement views: RF I&Q versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:IQVTime[:MEASVIEW<y>]:LOAD:TRACe:Q <file_name>
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<file_name>::<string> specifies the file from which to load trace data.The file extension is .RFIQVsTime. You can omit the extension.

Examples

MMEMORY:IQVTIME:MEASVIEW1:LOAD:TRACE:Q "Sample2" loads the I trace data from the *Sample2.RFIQVsTime* file.

MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe:I

Enables display of a recalled trace file in Trace. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: RF I&Q versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe:I { OFF | ON | 0 | 1 }
MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe:I?
```

Related Commands

MMEMory:IQVTime[:MEASVIEW<y>]:LOAD:TRACe:I (on page 1560)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 disables display of the recalled trace.

ON or 1 enables display of the recalled trace.

Examples

MMEMORY:IQVTIME:MEASVIEW1:SHOW:TRACE:I ON enables display of the recalled data loaded in the Trace.

MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe<x>:Q

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: RF I&Q versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe<x>:Q { OFF | ON | 0 | 1 }
MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe<x>:Q?
```

Related Commands

MMEMory:IQVTIME[:MEASVIEW<y>]:SHOW:TRACe<x>:Q (on page 1562)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 disables display of the recalled trace.

ON or 1 enables display of the recalled trace.

Examples

MMEMORY:IQVTIME:MEASVIEW1:SHOW:TRACE3:Q ON enables display of the recalled data loaded in Trace3.

MMEMory:IQVTime[:MEASVIEW<y>]:STORe:TRACe:I (No Query Form)

Stores I trace data in the specified file.

Conditions

Measurement views: RF I&Q versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:IQVTime[:MEASVIEW<y>]:STORe:TRACe:I <file_name>
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<file_name>::<string> specifies the file in which to store trace data.The file extension is .RFIQVsTime. You can omit the extension.

Examples

MMEMORY:IQVTIME:MEASVIEW1:STORE:TRACE:I"Sample1" stores the I trace data in the *Sample1.RFIQVsTime* file.

MMEMory:IQVTime[:MEASVIEW<y>]:STORe:TRACe:Q (No Query Form)

Stores Q trace data in the specified file.

Conditions

Measurement views: RF I&Q versus Time

Group

Mass Memory commands

Syntax

`MMEMory:IQVTime[:MEASVIEW<y>]:STORe:TRACe:Q <file_name>`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<file_name>::<string>` specifies the file in which to store trace data.The file extension is .RFIQVsTime. You can omit the extension.

Examples

`MMEMORY:IQVTIME:MEASVIEW1:STORE:TRACE:Q "Sample2"` stores the Q trace data in the *Sample2.RFIQVsTime* file.

MMEMory:LOAD:IQ (No Query Form)

Loads time domain IQ waveform into the acquisition memory from a file.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:LOAD:IQ <file_name>`

Arguments

`<file_name>::<string>` specifies the file to load IQ data from. The file extension .tiq is for non-multichannel tiq files and .tiqm for multichannel tiq files. You can omit the extension.

Examples

`MMEMORY:LOAD:IQ "IQ1"` loads IQ data from the *IQ1.tiq* file.

MMEMory:LOAD:STATe (No Query Form)

Loads the instrument setup from a specified file for the currently selected view.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:LOAD:STATe <file_name>`

Arguments

`<file_name>::<string>` specifies the file to load the instrument setup from.The file extension is .setup. You can omit the extension.

Examples

`MMEMORY:LOAD:STATE "STATE1"` loads the instrument setup from the *STATE1.setup* file.

MMEMory:LOAD:TRACe (No Query Form)

Loads the trace data from a specified file for the currently selected view.

Conditions

Measurement views (See the table below)

Group

Mass Memory commands

Syntax

`MMEMory:LOAD:TRACe <file_name>`

Related Commands

MMEMory:STORe:TRACe (on page 1587)

Arguments

`<file_name>::<string>` specifies the file to load the trace data from. The file extension is named for the measurement view as shown in the following table.The trace file is not available in some views which are indicated by "NA" in the file extension column.

For the views that allow multiple-trace display, select the trace to load or store using the command listed in the trace selection column in the following table. You can load the specified trace with any trace data that you saved in the view if the traces have the same units. For example, you can load Trace 2 with Trace 1 data that you saved.

Trace file extension and trace selection command

Display group	Measurement view	File extension	Trace selection
General signal viewing	Spectrum	Specan	TRACe<x>:SPECtrum:SELect
	DPX spectrum	dpt	TRACe<x>:DPX:SELect
	Amplitude versus Time	AmplVsTime	TRACe<x>:AVTime:SELect
	Frequency versus Time	FreqVsTime	NA
	Phase versus Time	PhaseVsTime	NA
	RF I&Q versus Time	RFIQVsTime	NA
	Spectrogram	Sogram	NA
	Time overview	NA	NA
General purpose analog modulation (Option 21 only)	AM	AmVsTime	NA
	FM	FmVsTime	NA
	PM	PmVsTime	NA
General purpose digital modulation (Option 21 only)	Constellation	NA	NA
	Demodulated I & Q versus Time	NA	NA
	Eye Diagram	NA	NA
	EVM versus Time	NA	NA
	Frequency Deviation versus Time	NA	NA
	Magnitude error versus Time	NA	NA
	Phase error versus Time	NA	NA
	Signal quality	NA	NA
	Symbol table	NA	NA
	Trellis Diagram	NA	NA

Display group	Measurement view	File extension	Trace selection
RF measurements	CCDF	CCDF	TRACe<x>:CCDF:SELect
	Channel power and ACPR	NA	NA
	MCPR	NA	NA
	Occupied Bandwidth	NA	NA
	Phase noise (Option 11 only)	PhaseNoise	TRACe<x>: {FSETtling|PSETtling}:SELect
	Spurious	NA	NA
Pulsed RF	Pulse statistics	NA	NA
	Pulse table	NA	NA
	Pulse trace	NA	NA

Examples

`MMEMORY:LOAD:TRACE "TRACE1"` loads the trace data from the `TRACE1.Specan` file when the spectrum view is selected.

MMEMory:LTE:ACLR:LOAD:TABLe (No Query Form)

Loads the LTE ACLR table containing the limits for enabled ranges from the specified .cvs file.

Conditions

Measurement view: LTE ACLR

Group

Mass Memory commands

Syntax

`MMEMory:LTE:ACLR:LOAD:TABLe <string>`

Arguments

`<file_name>::<string>` specifies the file from which to load the LTE ACLR table. The file extension is `.csv`. You can omit the extension.

Examples

`MMEMORY:LTE:ACLR:LOAD:TABLE "Table1"` loads the LTE ACLR table from the *Table1.csv* file.

MMEMory:LTE:ACLR:STORe:TABLe (No Query Form)

Stores the LTE ACLR table containing the limits for enabled ranges in a specified

.cvs file, allowing you to export the file into Microsoft Excel or other database system.

Conditions

Measurement view: LTE ACLR

Group

Mass Memory commands

Syntax

```
MMEMory:LTE:ACLR:STORe:TABLe <string>
```

Arguments

`<file_name>::<string>` specifies the file in which to store the LTE ACLR table.

The file extension is *.csv*. You can omit the extension.

Examples

`MMEMORY:LTE:ACLR:STORE:TABLE "Table1"` stores the LTE ACLR table in the Table1.csv file.

MMEMory:MAPit:LOAD (No Query Form)

Loads the MapIt measurement results from the specified file.

Conditions

Measurement views: Spectrum, DPX, Spectrogram, Amplitude vs Time, Channel Power, Occupied Bandwidth

Group

Mass Memory commands

Syntax

```
MMEMory:MAPit:LOAD <filename>
```

Arguments

`<filename>::<string>` the name of the file from which to load the MapIt data.

Examples

`MMEMORY:MAPIT:LOAD "C:\SignalVu-PC files\MapIt_results1"` Loads the MapIt measurement results in the MapIt_results1 file from the C:SignalVu-PC files folder.

MMEMory:MAPit:STORe (No Query Form)

Save the selected MapIt measurement results to a file. The results to save are selected by the <result_index>. The saved files are compressed .zip files.

Conditions

Measurement views: Spectrum, DPX, Spectrogram, Amplitude vs Time, Channel Power, Occupied Bandwidth

Group

Mass Memory commands

```
Syntax
MMEMory:MAPit:STORe <filename>, <result_index> [,<result_index]
```

Arguments

<filenam>::<string> the name of the file in which to store the MapIt measurement results.

<result_index>::<NRf>. The 1-based index of the MapIt result to load. See the MapIt editor for the list of results. index 1 is the first result at the top of the list.

Examples

MMEMORY:MAPIT:STORE ??

MMEMory:MAPit:STORe:ALL (No Query Form)

Saves all of the MapIt measurement results from memory to the specified file.

Conditions

Measurement views: Spectrum, DPX, Spectrogram, Amplitude vs Time, Channel Power, Occupied Bandwidth

Group

Mass Memory commands

Syntax

MMEMory:MAPit:STORe:ALL <filename>

Arguments

<filename>::<string> the name of the file in which to store the MapIt measurement results.

Examples

MMEMORY:MAPIT:STORE:ALL "C:\SignalVu-PC files\MapIt_results1" stores the MapIt measurement results in the MapIt_results1 file in the C:SignalVu-PC files folder.

MMEMory:NOISe:GAIN:LOAD:TRACe (No Query Form)

Loads the Noise Gain trace data from the specified file.

Conditions

Measurement view: Gain

Group

Mass Memory commands

Syntax

MMEMory:NOISe:GAIN:LOAD:TRACe <file_name>

Related Commands

MMEMory:NOISe:GAIN:STORe:TRACe (on page 1569)

Arguments

<file_name> = the file from which to load trace data.

Examples

MMEMORY:NOISE:GAIN:LOAD:TRACE trace1 will load the trace1 data file.

MMEMory:NOISe:GAIN:SHOW:TRACe

Show or hide the Noise Gain trace from the specified file.

Conditions

Measurement view: Gain display

Group

Mass Memory commands

Syntax

```
MMEMory:NOISe:GAIN:SHOW:TRACe { OFF | ON | 0 | 1 }
MMEMory:NOISe:GAIN:SHOW:TRACe
```

Arguments

`OFF` or 0 sets the trace to hide from the specified file.

`ON` or 1 sets the trace to show from the specified file.

Returns

`0` means the trace is hidden.

`1` means the trace is showing.

Examples

`MMEMORY:NOISE:GAIN:SHOW:TRACE?` might return `1`, indicating that the trace is set to show from the specified file.

MMEMory:NOISe:GAIN:STORe:TRACe (No Query Form)

Stores the Noise Gain trace data in the specified file.

Conditions

Measurement view: Gain display

Group

Mass Memory commands

Syntax

```
MMEMory:NOISe:GAIN:STORe:TRACe <file_name>
```

Related Commands

MMEMory:NOISe:GAIN:LOAD:TRACe (on page 1568)

Arguments

`<file_name>` = the file in which to store trace data.

Examples

```
MMEMORY:NOISE:GAIN:STORE:TRACE
```

MMEMory:Noise:LOAD:ENRCALibration (No Query Form)

Loads the specified Noise Figure ENR table.

Conditions

Measurement view: Noise display

Group

Mass Memory commands

Syntax

```
MMEMory:Noise:LOAD:ENRCALibration <filename>
```

Arguments

`<file_name>` = the file from which to load ENR calibration data.

Examples

```
MMEMORY:NOISE:LOAD:ENRCALIBRATION
```

MMEMory:Noise:LOAD:FREQTABle (No Query Form)

Loads the specified Noise Figure Frequency table.

Conditions

Measurement view: Noise display

Group

Mass Memory commands

Syntax

```
MMEMory:Noise:LOAD:FREQTABle <filename>
```

Arguments

`<filename>` = the file from which to load the frequency table data.

Examples

```
MMEMORY:NOISE:LOAD:FREQTABLE
```

MMEMory:Noise:STORe:ENRCALibration (No Query Form)

Saves the Noise Figure ENR table to the specified location.

Conditions

Measurement view: Noise display

Group

Mass Memory commands

Syntax

```
MMEMory:Noise:STORe:ENRCALibration <filename>
```

Arguments

`<filename>` = the file in which to store ENR calibration data.

Examples

```
MMEMORY:NOISE:STORE:ENRCALIBRATION
```

MMEMory:Noise:STORe:FREQTABle (No Query Form)

Saves the Noise Figure Frequency table to the specified location.

Conditions

Measurement view: Noise display

Group

Mass Memory commands

Syntax

```
MMEMory:Noise:STORe:FREQTABle <filename>
```

Arguments

`<filename>` = the file in which to store the frequency table data.

Examples

```
MMEMORY:NOISE:STORE:FREQTABLE
```

MMEMory:OFDM:CONSte:LOAD:TRACe (No Query Form)

Loads the OFDM constellation trace data from the specified file.

Conditions

Measurement views: OFDM

Group

Mass Memory commands

Syntax

```
MMEMory:OFDM:CONSte:LOAD:TRACe <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load the trace data.

Examples

`MMEMORY:OFDM:CONSTE:LOAD:TRACE "Sample1"` loads the trace data from the file with the OFDM Constellation measurement.

MMEMory:OFDM:CONSTe:SHOW:TRACe

Enables the display of a recalled trace.

Conditions

Measurement views: OFDM

Group

Mass Memory commands

Syntax

```
MMEMory:OFDM:CONSTe:SHOW:TRACe{ OFF | ON | 0 | 1 }
MMEMory:OFDM:CONSTe:SHOW:TRACe?
```

Arguments

`OFF` or 0 disables display of the recalled trace.

`ON` or 1 enables display of the recalled trace.

Examples

`MMEMORY:OFDM:CONSTE:SHOW:TRACE ON` enables the display of the recalled data loaded in the trace.

MMEMory:OFDM:CONSte:STORe:TRACe (No Query Form)

Stores the OFDM constellation measurement trace data in the specified file.

Conditions

Measurement views: OFDM

Group

Mass Memory commands

Syntax

```
MMEMory:OFDM:CONSte:STORe:TRACe <file_name>
```

Arguments

`<file_name>::<string>` specifies the file in which to store the trace data.

Examples

`MMEMORY:OFDM:CONSTE:STORE:TRACE "Sample1"` stores the trace data in the Sample1 file in the OFDM Constellation measurement.

MMEMory:PHVTime[:MEASVIEW<y>]:LOAD:TRACe (No Query Form)

Loads the Phase versus Time trace data from the specified file.

Conditions

Measurement views: Phase versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:PHVTime[:MEASVIEW<y>]:LOAD:TRACe <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.The file extension is .PhaseVsTime. You can omit the extension.

Examples

MMEMORY:PHVTIME:MEASVIEW1:LOAD:TRACE "Sample1" loads the Phase versus Time trace data from the *Sample1.PhaseVsTime* file.

MMEMory:PHVTime[:MEASview<y>]:SHOW:TRACe

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: Phase versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:PHVTime[:MEASview<y>]:SHOW:TRACe { OFF | ON | 0 | 1 }
MMEMory:PHVTime:SHOW:TRACe?
```

Related Commands

MMEMory:PHVTime[:MEASview<y>]:LOAD:TRACe (on page 1572)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 disables display of the recalled trace.

ON or 1 enables display of the recalled trace.

Examples

MMEMORY:PHVTIME:MEASview1:SHOW:TRACE ON enables display of the recalled data loaded in the Trace.

MMEMory:PHVTime[:MEASVIEW<y>]:STORe:TRACe (No Query Form)

Stores the Phase versus Time trace data in the specified file.

Conditions

Measurement views: Phase versus Time

Group

Mass Memory commands

Syntax

```
MMEMory:PHVTime[:MEASVIEW<y>]:STORe:TRACe <file_name>
```

Arguments

<file_name>::<string> specifies the file in which to store trace data.The file extension is .PhaseVsTime. You can omit the extension.

Examples

`MMEMORY:PHVTIME:MEASVIEW1:STORE:TRACE "Sample1"` stores the Phase versus Time trace data in the *Sample1.PhaseVsTime* file.

MMEMory:PNOise:LOAD:TRACe<x> (No Query Form)

Loads the Phase Noise trace data from the specified file. The parameter <x> = 1 or 2; only Trace1 and Trace2 are used for Phase Noise measurement.

Conditions

Measurement views: Phase noise

Group

Mass Memory commands

Syntax

```
MMEMory:PNOise:LOAD:TRACe<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.

Examples

`MMEMORY:PNOISE:LOAD:TRACE1 "Wfm1"` loads Trace1 data from the Wfm1 file.

MMEMory:PNOise:SHOW:TRACe<x>

Enables display of a recalled Phase Noise trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: Phase noise

Group

Mass Memory commands

Syntax

```
MMEMory:PNOise:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:PNOise:SHOW:TRACe<x>?
```

Related Commands

MMEMory:PNOise:LOAD:TRACe<x> (on page 1574)

Arguments

`OFF` or 0 disables display of the recalled trace.

`ON` or 1 enables display of the recalled trace.

Examples

`MMEMORY:PNOISE:SHOW:TRACE1 ON` enables display of the recalled data loaded in Trace1.

MMEMory:PNOise:STORe:TRACe<x> (No Query Form)

Stores the Phase Noise trace data in the specified file. The parameter <x> = 1 or 2; only Trace1 and Trace2 are used for Phase Noise measurement.

Conditions

Measurement views: Phase noise

Group

Mass Memory commands

Syntax

`MMEMory:PNOise:STORe:TRACe<x> <file_name>`

Arguments

`<file_name>::<string>` specifies the file in which to store trace data.

Examples

`MMEMORY:PNOISE:STORE:TRACE1 "WFM1"` stores Trace 1 data in the WFM1 file.

MMEMory:SEM:LOAD:TABLe (No Query Form)

Loads the Spectral Emissions Mask table containing the limits for enabled ranges from the specified file.

Conditions

Measurement views: Spectral Emissions Mask

Group

Mass Memory commands

Syntax

`MMEMory:SEM:LOAD:TABLe <file_name>`

Arguments

`<file_name>::<string>` specifies the file to load the SEM table from.The file extension is **.csv**. You can omit the extension.

Examples

`MMEMORY:SEM:LOAD:TABLE "Table1"` loads the SEM table from the *Table1.csv* file.

MMEMory:SEM:STORe:TABLe (No Query Form)

Stores the Spectral Emissions Mask table containing the limits for enabled ranges in a specified file in the CSV format, allowing you to export the file into Microsoft Excel or other database systems.

Conditions

Measurement views: Spectral Emissions Mask

Group

Mass Memory commands

Syntax

```
MMEMory:SEM:STORe:TABLe <file_name>
```

Arguments

`<file_name>::<string>` specifies the file to store the SEM table in.The file extension is .csv. You can omit the extension.

Examples

`MMEMORY:SEM:STORE:TABLE "Table1"` stores the SEM table in the *Table1.csv* file.

MMEMory:SGRam[:MEASview<y>]:LOAD:TRACe (No Query Form)

Loads the Spectrogram trace data from the specified file. No trace number is needed or allowed.

Conditions

Measurement views: Spectrogram

Group

Mass Memory commands

Syntax

```
MMEMory:SGRam[:MEASview<y>]:LOAD:TRACe <file_name>
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`<file_name>::<string>` specifies the file from which to load trace data.The file extension is .sogram. You can omit the extension.

Examples

`MMEMory:SGRam:MEASview1:LOAD:TRACe5 "Spec2"` loads Trace5 data from the file *Spec2.sogram*.

MMEMory:SGRam[:MEASview<y>]:SHOW:TRACe

Enables display of a recalled trace file in Trace. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: Spectrogram

Group

Mass Memory commands

Syntax

```
MMEMory:SGRam[:MEASview<y>]:SHOW:TRACe { OFF | ON | 0 | 1 }
MMEMory:SGRam[:MEASview<y>]:SHOW:TRACe?
```

Related Commands

MMEMory:SGRam[:MEASview<y>]:LOAD:TRACe (on page 1576)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

OFF or 0 disables display of the recalled trace.

ON or 1 enables display of the recalled trace.

Returns

{ OFF | ON | 0 | 1 }

Examples

MMEMory:SGRam:MEASview1:SHOW:TRACe ON enables display of the recalled data loaded in Trace.

MMEMory:SGRam[:MEASview<y>]:STORe:TRACe (No Query Form)

Stores the Spectrogram trace data in the specified file. No trace number is needed or allowed.

NOTE: Only valid when the spectrum or spectrogram measurements are running.

Conditions

Measurement views: Spectrogram

Group

Mass Memory commands

Syntax

MMEMory:SGRam[:MEASview<y>]:STORe:TRACe <file_name>

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<file_name>::<string> specifies the file in which to store trace data.The file extension is .sogram. You can omit the extension.

Examples

MMEMory:SGRam:MEASview1:STORe:TRACe "Spec2" stores Trace data in the *Spec2.sogram* file.

MMEMory:SGRam[:MEASview<y>]:STORe:PLOT

Stores the spectrogram plot data into a specified location and file.

Conditions

Measurement views: Spectrogram

Group

Mass Memory commands

Syntax

MMEMory:SGRam[:MEASview<y>]:STORe:PLOT <file_name>

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<file_name> = <String> specifies the file location and file name to which the plot to be saved.

Returns

None

Examples

MMEMory:SGRam:MEASview1:STORe:PLOT "C:\SignalVu-PC Files\Sample1.Specan" saves the plot in Sample1.Specan file.

MMEMory:SGRam[:MEASview<y>]:STORe:PLOT:DONe (Query only)

Determines whether the spectrogram plot data is saved or not saved.

Conditions

Measurement views: Spectrogram

Group

Mass Memory commands

Syntax

MMEMory:SGRam[:MEASview<y>]:STORe:PLOT:DONe?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<Boolean> 0, 1

1 indicates the spectrogram plot data is saved.

0 indicates the spectrogram plot data is not saved.

Examples

MMEMory:SGRam:MEASview1:STORe:PLOT:DONe? might return 1, indicating the spectrogram plot data is saved.

MMEMory:SPECtrum:MEASview<y>:LOAD:TRACe (No Query Form)

Loads the spectrum trace data from the specified file.

The parameter <x> = 1 to 4; Trace 5 (spectrogram) is not valid.

Conditions

Measurement views: Spectrum

Group

Mass Memory commands

Syntax

MMEMory:SPECtrum:MEASview<y>:LOAD:TRACe <file_name>

Arguments

`<file_name>::<string>` specifies the file from which to load trace data. The file extension is .Specan. You can omit the extension.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMory:SPECtrum:MEASview2:LOAD:TRACe "C:\SignalVu-PC Files\Sample1.Specan"` loads Trace 1 data from Sample1.Specan file

MMEMory:SPECtrum[:MEASview<y>]:SHOW:TRACe<x>

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views: Spectrum

Group

Mass Memory commands

Syntax

```
MMEMory:SPECtrum[:MEASview<y>]:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:SPECtrum[:MEASview<y>]:SHOW:TRACe<x>?
```

Related Commands

MMEMory:SPECtrum[:MEASview<y>]:LOAD:TRACe (on page 1578)

Arguments

`OFF` or `0` disables display of the recalled trace.

`ON` or `1` enables display of the recalled trace.

The parameter <x> = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:SPECTRUM:MEASVIEW2:SHOW:TRACE2 ON` enables display of the recalled data loaded in Trace2.

MMEMory:SPECtrum[:MEASview<y>]:STORe:PLOT (No Query Form)

Stores the spectrum plot data into a specified location and file.

Conditions

Measurement view: Spectrum

Group

Mass Memory commands

Syntax

MMEMory:SPECtrum[:MEASview<y>]:STORe:PLOT <file_name>

Arguments

<file_name> = <String> specifies the file location and file name to which the plot to be saved.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

None

Examples

MMEMORY:SPECTRUM:MEASVIEW2:STORE:PLOT "C:\SignalVu-PC Files\Sample1.Specan" saves the plot in Sample1.Specan file

MMEMory:SPECtrum[:MEASview<y>]:STORe:PLOT:DONe (Query Only)

Determines whether the spectrum plot data is saved or not saved.

Conditions

Measurement view: Spectrum

Group

Mass Memory commands

Syntax

MMEMory:SPECtrum[:MEASview<y>]:STORe:PLOT:DONe?

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<Boolean> 0, 1

1 indicates the spectrum plot data is saved

0 indicates the spectrum plot data is not saved

Examples

MMEMORY:SPECTRUM:MEASVIEW2:STORE:PLOT:DONE might return 1, indicating the spectrum plot data is saved

MMEMory:SPECtrum[:MEASview<y>]:STORe:TRACe (No Query Form)

Stores the spectrum trace data in the specified file. The parameter <x> = 1 to 5; All traces are valid.

NOTE: TRACe5 (spectrogram) is valid when the spectrum and spectrogram measurements are running.

Conditions

Measurement views: Spectrum

Group

Mass Memory commands

Syntax

`MMEMory:SPECtrum[:MEASview<y>]:STORe:TRACe <file_name>`

Arguments

`<file_name>::<string>` specifies the file in which to store trace data.The file extension is .Specan. You can omit the extension.

The file extension is named for the measurement view as shown in the table (Click here for Trace file extension and trace selection command) The trace file is not available in some views which are indicated by "NA" in the file extension column. For the views that allow multiple-trace display, select the trace to load or store using the command listed in the trace selection column.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`MMEMORY:SPECTRUM:MEASview2:STORE:TRACE "TRACE1"` stores the trace data in the TRACE1.Specan file when the spectrum view is selected.

MMEMory:SPURious:LOAD:TABLe (No Query Form)

Loads the spurious table containing the limits for enabled ranges from the specified file.

Conditions

Measurement views: Spurious

Group

Mass Memory commands

Syntax

`MMEMory:SPURious:LOAD:TABLe <file_name>`

Arguments

`<file_name>::<string>` specifies the file to load the spurious table from.The file extension is `.csv`. You can omit the extension.

Examples

`MMEMORY:SPURIOUS:LOAD:TRACE1 "Table1"` loads the spurious table from the *Table1.csv* file.

MMEMory:SPURious:RECAll:TRACe (No Query Form)

Recalls the spurious trace data from the specified file and trace number.

Conditions

Measurement view: Spurious Display

Group

Mass Memory commands

Syntax

```
MMEMory:SPURious:RECAll:TRACe <x> <file_name>
```

Arguments

<x> = 1,2,3,4 is the trace `<file_name> = <String>` specifies the file location and file name to which the trace data to be Recalled

Returns

None

Examples

`MMEMORY:SPURIOUS:RECALL:TRACE "C:\SignalVu-PC Files\Sample1.spurious"` recalls the Trace 3 data from the Sample1.spurious file.

MMEMory:SPURious:SHOW:TRACe (No Query Form)

Displays the spurious trace data from the specified file and trace number.

Conditions

Measurement view: Spurious Display

Group

Mass Memory commands

Syntax

```
MMEMory:SPURious:SHOW:TRACe <x> <file_name>
```

Arguments

`<x>` = 1,2,3,4 is the trace

`<file_name> = <String>` specifies the file location and file name to which the trace data to be displayed.

Returns

None

Examples

`MMEMORY:SPURIOUS:SHOW:TRACE "C:\SignalVu-PC Files\Sample1.spurious"` displays the Trace 2 data from Sample1.spurious file.

MMEMory:SPURious:STORe:TABLe (No Query Form)

Stores the spurious table containing the limits for enabled ranges in a specified file in the CSV (Comma Separated Values) format, allowing you to export the file into Microsoft Excel or other database systems.

Conditions

Measurement views: Spurious

Group

Mass Memory commands

Syntax

`MMEMory:SPURious:STORe:TABLe <file_name>`

Arguments

`<file_name>::<string>` specifies the file to store the spurious table in.The file extension is .csv. You can omit the extension.

Examples

`MMEMORY:SPURIOUS:STORE:TABLE "Table1"` stores the spurious table in the *Table1.csv* file.

MMEMory:SPURious:STORe:TRACe (No Query Form)

Stores the specified spurious trace data into a specified location and file.

Conditions

Measurement view: Spurious Display

Group

Mass Memory commands

Syntax

`MMEMory:SPURious:STORe:TRACe <x> <file_name>`

Arguments

<x> = 1,2,3,4 is the trace

`<file_name> = <String>` specifies the file location and file name to which the trace data to be saved.

Returns

None

Examples

`MMEMORY:SPURIOUS:STORE:TRACE "C:\SignalVu-PC Files\Sample1.spurious"` saves the Trace 1 data in Sample1.spurious file.

MMEMory:STORe:IQ (No Query Form)

Saves time-domain IQ waveform in the acquisition memory to a specified file.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:STORe:IQ <file_name>`

Arguments

`<file_name>::<string>` specifies the file to save IQ data.

The file extension .tiq is for non-multichannel setup and .tiqm for multichannel setup. You can omit the extension.

Examples

`MMEMORY:STORE:IQ "IQ1"` saves IQ data to the *IQ1.tiq* file.

MMEMory:STORe:IQ:CSV (No Query Form)

Saves time-domain IQ waveform in the acquisition memory to a specified file in the CSV (Comma Separated Values) format, allowing you to export the file into Microsoft Excel or other database systems.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:STORe:IQ:CSV <file_name>`

Arguments

`<file_name>::<string>` specifies the file to save IQ data.The file extension is .csv. You can omit the extension.

Examples

`MMEMORY:STORE:IQ:CSV "IQ2"` saves IQ data to the *IQ2.cs(less t eq)* file.

MMEMory:STORe:IQ:MAT (No Query Form)

Saves time-domain IQ waveform in the acquisition memory to a specified file in the MATLAB format, allowing you to export the file into the MATLAB technical computing environment.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:STORe:IQ:MAT <file_name>`

Arguments

`<file_name>::<string>` specifies the file to save IQ data.The file extension is .mat. You can omit the extension.

Examples

`MMEMORY:STORE:IQ:MAT "IQ3"` saves IQ data to the *IQ3.mat* file.

MMEMory:STORe:IQ:SELEct:DATA

Sets or queries the data type stored when saving acquisition data files.

Conditions

Measurement views

Group

Mass Memory commands

Syntax

```
MMEMory:STORe:IQ:SELEct:DATA { IQ | SPECtra | ALL }
```

NOTE: Although the command includes IQ as part of the command, the command applies to all the data stored in the file, not only IQ data.

Arguments

`IQ` specifies that IQ data be saved in the data file.

`SPECtra` specifies that DPX spectra be saved in the data file.

`ALL` specifies that both IQ and DPX spectra be saved in the data file.

Examples

`MMEMORY:STORE:IQ:SELECT:DATA SPECTRA` sets the data type to DPX Spectra.

MMEMory:STORe:IQ:SELEct:FRAMes

Sets or queries which frames are saved when saving TIQ acquisition data files.

Conditions

Measurement views

Group

Mass Memory commands

Syntax

```
MMEMory:STORe:IQ:SELEct:FRAMes { ACQuisition | HISTory | SELected | ALL }
```

Arguments

`ACQuisition` saves the entire acquisition that contains the current frame.

`HISTory` saves the current frame.

`SELected` saves only selected frames.

`ALL` saves all acquired frames.

MMEMory:STORe:IQ:SELEct:LENGth

Sets or queries what portion of each record is saved when saving acquisition data.

Conditions

Measurement views

Group

Mass Memory commands

Syntax

```
MMEMory:STORe:IQ:SELEct:LENGth { ENTire | LENGth }
MMEMory:STORe:IQ:SELEct:LENGth?
```

Arguments

`ENTire` saves the entire record

`LENGth` saves the portion of the record being analyzed.

MMEMory:STORe:MSTate (No Query Form)

Stores the measurement parameters to a specified file in the ASCII text format for the currently selected view, allowing you to export the file into other applications.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:STORe:MSTate <file_name>`

Arguments

`<file_name>::<string>` specifies the file to store the measurement parameters. The file extension is .txt. You can omit the extension.

Examples

`MMEMORY:STORE:MSTATE "MSTATE1"` stores the measurement parameters to the *MSTATE1.txt* file.

MMEMory:STORe:RESults (No Query Form)

Stores the measurement results including measurement parameters and trace data to a specified file in the CSV (Comma Separated Values) format for the currently selected view, allowing you to export the file into Microsoft Excel or other database systems.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

`MMEMory:STORe:RESults <file_name>`

Arguments

`<file_name>::<string>` specifies the file to store the measurement results.

The file extension is *.csv*. You can omit the extension.

Examples

`MMEMORY:STORE:RESULTS "RESULT1"` stores the measurement results to the *RESULT1.csv* file.

MMEMory:STORe:SCReen (No Query Form)

Stores the current display as a bitmap image file in one of several standard formats. When no format is specified, the system uses the default, .png.

Conditions

Measurement views: All

Group

Mass Memory commands

```
Syntax
MMEMory:STORe:SCReen <file_name>{ .bmp | .jpg | .png }
```

Arguments

`<file_name>::<string>` specifies the file to store the screen image.

Examples

`MMEMORY:STORE:SCREEN "RESULT1.png"` stores the current screen image into the file*RESULT1.png*.

MMEMory:STORe:STATe (No Query Form)

Stores the instrument setup to a specified file for the currently selected view.

Conditions

Measurement views: All

Group

Mass Memory commands

Syntax

```
MMEMory:STORe:STATe <file_name>
```

Arguments

`<file_name>::<string>` specifies the file to store the instrument setup.The file extension is setup. You can omit the extension.

Examples

`MMEMORY:STORE:STATE "STATE1"` stores the instrument setup in the *STATE1.setup* file.

MMEMory:STORe:TRACe (No Query Form)

Stores the trace data in a specified file for the currently selected view.

Conditions

Measurement views (See MMEMory:LOAD:TRACe (on page 1564).)

Group

Mass Memory commands

Syntax

MMEMory:STORe:TRACe <file_name>

Related Commands

MMEMory:IQVTIME:SHOW:TRACe:I (on page 1560)

Arguments

<file_name>::<string> specifies the file to store the trace data in.

The file extension is named for the measurement view as shown in the table in MMEMory:LOAD:TRACe. The trace file is not available in some views which are indicated by "NA" in the file extension column. For the views that allow multiple-trace display, select the trace to load or store using the command listed in the trace selection column.

Examples

MMEMORY:STORE:TRACE "TRACE1" stores the trace data in the *TRACE1.Specan* file when the spectrum view is selected.

MMEMory:TOVerview[:MEASview<y>]:LOAD:TRACe1 (No Query Form)

Loads the trace data from a specified file into Trace1. Refer to MMEMory:LOAD:TRACe (on page 1564) for the correct file extensions for each trace type.

Conditions

Measurement views

Group

Mass Memory commands

Syntax

MMEMory:TOVerview[:MEASview<y>]:LOAD:TRACe1 <file_name>

Related Commands

MMEMory[:MEASview<y>]:STORe:TRACe (on page 1587)

Arguments

<file_name>::<string> specifies the file path and name to load the trace data from. The file extension is named for the measurement view. See the table in MMEMory:LOAD:TRACe.

Most trace file types are compatible with only one Measurement view.

Examples

MMEMORY:TOVERVIEW:MEASVIEW1:LOAD:TRACE1 "TrialB" loads the trace data from the file *TRIALB.TOV* when the spectrum view is selected.

MMEMory:TOVerview[:MEASview<y>]:SHOW:TRACe1

Enables display of a recalled trace file in Trace<x>. The result is the same as selecting “Show recalled trace” in the Recall traces dialog box or selecting Show in the Trace Overview display.

Conditions

Measurement views

Group

Mass Memory commands

Syntax

```
MMEMory:TOVerview[:MEASview<y>:SHOW]:TRACe1 { OFF | ON | 0 | 1 }
MMEMory:TOVerview[:MEASview<y>]:SHOW:TRACe1?
```

Related Commands

MMEMory:TOVerview[:MEASview<y>]:LOAD:TRACe1 (on page 1588)

Arguments

`OFF` or `0` disables display of the recalled trace.

`ON` or `1` enables display of the recalled trace.

Examples

`MMEMORY:TOVERVIEW:MEASVIEW1:SHOW:TRACE1 ON` enables display of the recalled data loaded in Trace2.

MMEMory:TOVerview[:MEASview<y>]:STORe:TRACe1 (No Query Form)

Stores the trace data for Trace1 into the specified file.

Conditions

Measurement views

Group

Mass Memory commands

Syntax

```
MMEMory:TOVerview[:MEASview<y>]:STORe:TRACe1 <file_name>
```

Related Commands

MMEMory[:MEASview<y>]:STORe:TRACe (on page 1587)

Arguments

`<file_name>::<string>` specifies the file to store the trace data in.

The file extension is named for the measurement view as shown in the table (See MMEMory:LOAD:TRACe (on page 1564).) The trace file is not available in some views which are indicated by "NA" in the file extension column. For the views that allow multiple-trace display, select the trace to load or store using the command listed in the trace selection column.

Examples

`MMEMORY:TOVERVIEW:MEASVIEW1:STORE:TRACE1 "TrialB"` stores the Trace1 data into the file *TRIALB.TOV* when a spectrum view is selected.

MMEMory:TXGain:LOAD:TRACe<x> (No Query Form)

Load the specified saved trace from a file.

Conditions

Measurement view: Transmission Gain Where <x> is the trace 1, 2, or 3.

Group

Mass Memory commands

Syntax

```
MMEMory:TXGain:LOAD:TRACe<x> <file_name>
```

Arguments

`<file_name>::<string>` specifies the file from which to load trace data.

Examples

`MMEMory:TXGain:LOAD:TRACe1 "sample1"` loads the trace data from the sample1.tgt file.

MMEMory:TXGain:SHOW:TRACe<x>

Displays a saved trace instead of a live trace.

Conditions

Measurement view: Transmission Gain Where <x> is the trace 1, 2, or 3.

Group

Mass Memory commands

Syntax

```
MMEMory:TXGain:SHOW:TRACe<x> { OFF | ON | 0 | 1 }
MMEMory:TXGain:SHOW:TRACe<x>?
```

Arguments

`OFF` or `0` disables display of the recalled trace. ON or 1 enables display of the recalled trace.

Returns

OFF or 0 means that display of the recalled trace is disabled. ON or 1 means that display of the recalled trace is enabled.

Examples

`MMEMory:TXGain:SHOW:TRACe2 ON` enables display of the recalled data loaded in Trace 2.

MMEMory:TXGain:STORe:TRACe<x> (No Query Form)

Saves the selected trace to a file for later recall and analysis.

Conditions

Measurement view: Transmission Gain Where <x> is the trace 1, 2, or 3.

Group

Mass Memory commands

Syntax

```
MMEMory:TXGain:STORe:TRACe<x> <file_name>
```

Arguments

<file_name>::<string> specifies the file in which to store trace data. The file extension is .tgt. You can omit the extension.

Examples

MMEMory:TXGain:STORE:TRACe1 "Sample1" stores Trace 1 data in the Sample1.tgt file.

MMEMory:WLAN:AD:SUMMary:LIMIt:TABLe:LOAD (No Query Form)

Loads the Summary Limit table containing the limits for enabled ranges from the specified file in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Mass Memory commands

Syntax

MMEMory:WLAN:AD:SUMMary:LIMIt:TABLe:LOAD <file name>

Arguments

<file name>= <String> specifies the file to load the Summary Limit table from the file extension as *.csv*

Returns

None

Examples

MMEMORY:WLAN:AD:SUMMARY:LIMIT:TABLE:LOAD "Table1" loads the Summary Limit table from the Table1 *.csv* file.

MMEMory:WLAN:AD:SUMMary:LIMIt:TABLe:SAVE (No Query Form)

Stores the Summary Limit table containing the limits for enabled ranges in a specified file in the cvs format, allowing you to export the file into Microsoft Excel or other database systems in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Mass Memory commands

Syntax

MMEMory:WLAN:AD:SUMMary:LIMIt:TABLe:SAVE <file_name>

Arguments

<file_name>=<string> specifies the file to store the SEM table in the file extension as .csv.

Returns

None

Examples

`MMEMORY:WLAN:AD:SUMMARY:LIMIT:TABLE:SAVE "Table1"` stores the SEM table in the *Table1.csv file.*

MMEMory:WLAN:AY:SUMMary:LIMIt:TABLe:LOAD (No Query Form)

Loads the Summary Limit Table containing limits for enabled ranges from the specified *.csv* file.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Mass memory commands

Syntax

`MMEMory:WLAN:AY:SUMMary:LIMIt:TABLe:LOAD <file_name>`

Arguments

`<file_name>::=<string>` specifies the file to load the Summary Limit Table from a *.csv* file.

NOTE: You can omit the file extension.

Examples

`MMEM:WLAN:AY:SUMM:LIMI:TABL:LOAD "Table1"` loads the Summary Limit Table from file *Table1.csv*.

MMEMory:WLAN:AY:SUMMary:LIMIt:TABLe:SAVE (No Query Form)

Stores the Summary Limit Table containing limits for enabled ranges in a specified *.csv* file, allowing you to export the file into Microsoft Excel or other database systems.

This command will save both enabled and disabled entities.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Mass memory commands

Syntax

`MMEMory:WLAN:AY:SUMMary:LIMIt:TABLe:SAVE <file_name>`

Arguments

`<file_name>::=<string>` specifies the *.csv* file to store the SEM table.

NOTE: You can omit the file extension.

Examples

`MMEM:WLAN:AY:SUMM:LIMI:TABL:SAVE "Table2"` stores the SEM table in the file *Table2.csv*.

MMEMory:WLAN:CRESponse:LOAD:TRACe<x> (No Query Form)

Loads the selected WLAN Channel Response trace data from the specified file.

<x> is the selected trace, 1 or 2. 1 is the magnitude trace. 2 is the phase trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Mass Memory commands

Syntax

```
MMEMory:WLAN:CRESponse:LOAD:TRACe<x> <QString>
```

Arguments

Quoted string that specifies the file from which to load trace data.

Examples

`MMEMORY:WLAN:CRESPONSE:LOAD:TRACE2 "Sample1"` loads the WLAN Channel Response trace data from the Sample1 file into Trace 2 (phase trace).

MMEMory:WLAN:CRESponse:SHOW:TRACe<x>

Enables the display of a recalled WLAN Channel Response trace.

<x> is the selected trace, 1 or 2. 1 is the magnitude trace. 2 is the phase trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Mass Memory commands

Syntax

```
MMEMory:WLAN:CRESponse:SHOW:TRACe<x> {0|1|OFF|ON}
MMEMory:WLAN:CRESponse:SHOW:TRACe<x>?
```

Arguments

`ON` or `1` turns on the display of a recalled trace.

`OFF` or `0` turns off the display of a recalled trace.

Examples

`MMEMORY:WLAN:CRESPONSE:SHOW:TRACE2 ON` turns on the display of recalled trace 2.

MMEMory:WLAN:CRESponse:STORe:TRACe<x> (No Query Form)

Stores the WLAN Channel Response measurement trace data in the specified file.

<x> is the selected trace, 1 or 2. 1 is the magnitude trace. 2 is the phase trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Mass Memory commands

Syntax

```
MMEMory:WLAN:CRESponse:STORe:TRACe<x> <QString>
```

Arguments

Quoted string that specifies the file in which to store the trace data.

Examples

`MMEMORY:OFDM:CRESPONSE:STORE:TRACE2 "Sample1"` stores the trace data from Trace 2 into the Sample1 file.

TEST

Resets the trigger system and places all trigger sequences in the idle state. Any actions related to the trigger system that are in progress, such as a sweep or acquiring a measurement is also aborted.

To start data acquisition, use the INITiate commands.

Conditions

Measurement views: All

Group

Abort commands

Syntax

```
TEST
```

Related Commands

INITiate:CONTinuous (on page 1530)

INITiate:RESume (on page 1531)

Arguments

None

Examples

TEST resets the trigger system and stops data acquisition.

*OPC

Generates the operation complete message in the Standard Event Status Register (SESR) when all pending operations finish. The *OPC? query places the **ASCII** character "1" into the output queue when all pending operations are finished. The *OPC? response is not available to read until all pending operations finish.

The *OPC command allows you to synchronize the operation of the analyzer with your application program. Refer to Synchronizing execution (on page 2804) for the details.

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

```
*OPC
*OPC?
```

Arguments

None

*OPT? (Query Only)

Returns a list of options installed in your analyzer.

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

```
*OPT?
```

Arguments

None

Returns

The numbers of all the options installed in the analyzer, separated by commas. If no options have been installed, 0 is returned. The following table lists the options for the RSA Series analyzers.

Instrument options

Option	Description
09	Enhanced real time
10	Audio analysis
11	Phase noise and jitter measurement
12	Settling time measurement (frequency and phase)
21	General purpose modulation analysis
22	Flexible OFDM analysis
23	WLAN 802.11a/b/g/j/p analysis
24	WLAN 802.11n analysis
25	WLAN 802.11ac analysis

Option	Description
B25	25 MHz real-time capture bandwidth
B40	40 MHz real-time capture bandwidth
B85	85 MHz real-time capture bandwidth
B16x	165 MHz real-time capture bandwidth
50	1 MHz to 3/6.2 GHz pre-amplifier (RSA5103B/RSA5106B only)
51	1 MHz to 315/26.5 GHz pre-amplifier (RSA5115B/RSA5126B only)
53	Memory 4 GB acquisition memory total
56	Removable hard disk drive (not compatible with Option 59)
59	Internal hard disk drive, incompatible with Option 56
65	Digital I and Q outputs
66	Zero-span output
6566	Digital I and Q outputs and Zero-span output
PFR	Precision frequency reference
PFR50	Precision frequency reference and internal preamp (RSA5103B/RSA5126B only)
SSD	Includes additional solid-state drive for units equipped with Option 56. Minimum disk capacity is 480 GB. The Microsoft Windows 7 operating system and instrument software is preinstalled.

Examples

`*OPT?` might return 10,21,22, indicating that Option 10, 21, and 22 are currently installed in the analyzer.

Output commands

OUTPut:IF:{BANDwidth|BWIDth}

Sets or queries the IF output filter when `OUTPut:IF[:STATe]` is set to ON.

Conditions

Measurement views: All (Option 05 only)

Group

Output commands

Syntax

```
OUTPut:IF:{BANDwidth|BWIDth} { FLATtop | GAUSsian }
OUTPut:IF:{BANDwidth|BWIDth}?
```

Arguments

`FLATtop` selects the flattop filter.

`GAUSsian` selects the Gaussian filter.

Examples

`OUTPUT:IF:BANDWIDTH GAUSSIAN` selects the Gaussian filter for the IF output.

OUTPut:IF[:STATe]

Determines whether to turn on or off the 500 MHz IF Out on the rear panel.

Conditions

Measurement views: All (Option 05 only)

Group

Output commands

Syntax

```
OUTPut:IF[:STATe] { OFF | ON | 0 | 1 }
OUTPut:IF[:STATe]?
```

Related Commands

OUTPut:IF:{BANDwidth|BWIDth} (on page 1596)

Arguments

`OFF` or 0 turns off IF Out.

`ON` or 1 turns on IF Out.

Examples

`OUTPUT:IF:STATE ON` turns on IF Out.

OUTPut:IQ[:STATe]

Determines whether to enable or disable the digital IQ output data stream from the rear panel connectors.

Conditions

Measurement views: All (Option 05 only)

Group

Output commands

Syntax

```
OUTPut:IQ[:STATe] { 0 | 1 | OFF | ON }
OUTPut:IQ[:STATe]?
```

Arguments

OFF or 0 disables the digital IQ output.

ON or 1 enables the digital IQ output.

At *RST, this value is set to OFF.

Examples

OUTP:IQ:STAT ON enables the digital IQ output.

OUTP:IQ:STAT? may return OFF or 0, which means the digital IQ output is disabled.

OUTPut:NOISe[:STATe]

Determines whether to turn on or off the +28 V DC Out on the rear panel.

Conditions

Measurement views: All

Group

Output commands

Syntax

```
OUTPut:NOISe[:STATe] { OFF | ON | 0 | 1 }
OUTPut:NOISe[:STATe]?
```

Arguments

OFF or 0 turns off +28 V DC Out.

ON or 1 turns on +28 V DC Out.

Examples

OUTPUT:NOISE:STATE ON turns on +28 V DC Out.

OUTPut:IQ:SOURce

ets or queries the IQ data transfer state via the LVDS card in the CTRL7100A with option 05.

Conditions

Measurement views: All (Option 05 only for RSA7100A)

Group

Output commands

Syntax

```
OUTPut:IQ:SOURce { OFF | NORMal | CTP }
OUTPut:IQ:SOURce?
```

Arguments

OFF sets the IQ data transfer via LVDS to Off. This means that no streaming of data is occurring.

NORMal sets the IQ data transfer via LVDS to On. This means that streaming of data, if available, is occurring.

CTP sets the IQ data transfer via LVDS to Test (Count Pattern). This means the system is validating that the LVDS system connections are correct by sending a known counting pattern from the CTRL7100A LVDS card to the receiving LVDS card. Check the counting pattern on the receiving end to verify valid data transfer.

Examples

`OUTPUT:IQ:SOURCE?` might return NORMAL, indicating that IQ data transfer via LVDS is set to On and occurring if data is available.

OUTPut:TGen:BRIDge:MODE

Sets or queries the tracking generator bridge mode.

Conditions

Requires Option 04 in a RSA500A series or RSA600A series instrument.

Group

Output commands

Syntax

```
OUTPut:TGen:BRIDge:MODE { REFerence | CROSSover | REFLection| DISabled }
OUTPut:TGen:BRIDge:MODE
```

Arguments

Returns

Examples

```
OUTPUT:TGEN:BRIDGE:MODE
```

OUTPut:TGen:ENABle

Sets or queries the power state of the tracking generator.

Conditions

Requires Option 04 in a RSA500A series or RSA600A series instrument.

Group

Output commands

Syntax

```
OUTPut:TGen:ENABle { OFF | ON | 0 | 1 }
OUTPut:TGen:ENABle?
```

Arguments

Returns

Examples

```
OUTPUT:TGEN:ENABLE
```

OUTPut:TGen:FREQuency

Sets or queries the tracking generator frequency in Hz. The spectrum analyzer center frequency will also be set to match (track) the tracking generator frequency.

Conditions

Requires Option 04 in a RSA500A series or RSA600A series instrument.

Group

Output commands

Syntax

```
OUTPut:TGen:FREQuency <value>
OUTPut:TGen:FREQuency?
```

Arguments

Returns

Examples

```
OUTPUT:TGEN:FREQUENCY
```

OUTPut:TGen:INSTalled? (Query Only)

Queries for the presence of the tracking generator hardware.

Conditions

Requires Option 04 in a RSA500A series or RSA600A series instrument.

Group

Output commands

Syntax

```
OUTPut:TGen:INSTalled?
```

Returns

Examples

```
OUTPUT:TGEN:INSTALLED?
```

OUTPut:TGen:LEVel

Sets or queries the tracking generator output level in dBm.

Conditions

Requires Option 04 in a RSA500A series or RSA600A series instrument.

Group

Output commands

Syntax

```
OUTPut:TGen:LEVel <value>
OUTPut:TGen:LEVel?
```

Related Commands

Arguments

Returns

Examples

```
OUTPUT:TGEN:LEVEL
```

OUTPut:ZS:{BANDwidth|BWIDth}

Sets or queries the resolution bandwidth RBW filter for the Zero Span output on the rear panel connector.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:{BANDwidth|BWIDth} <value>
OUTPut:ZS:{BANDwidth|BWIDth}?
```

Arguments

`<value>::<NRf>` specifies the resolution bandwidth.

OUTPut:ZS:{BANDwidth|BWIDth}:AUTO

Determines whether to set the Zero Span resolution bandwidth manually or automatically.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:{BANDwidth|BWIDth}:AUTO { OFF | ON | 0 | 1 }
OUTPut:ZS:{BANDwidth|BWIDth}:AUTO?
```

Arguments

`OFF` or 0 manually sets the Zero Span output.

`ON` or 1 automatically sets the Zero Span output.

Examples

`OUTPUT:ZS:BANDWIDTH:AUTO ON` specifies that the Zero Span output will be set automatically.

OUTPut:ZS:{BANDwidth|BWIDth}:STATe

Sets or queries the state of the resolution bandwidth filter for the output connector on the rear panel.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:{BANDwidth|BWIDth}:STATe { Auto | Manual | None }
OUTPut:ZS:{BANDwidth|BWIDth}:STATe?
```

Arguments

`Auto` sets the resolution bandwidth filter to automatic mode.

`Manual` sets the resolution bandwidth filter to manual mode.

`None` bypasses the resolution bandwidth filter.

OUTPut:ZS:DELay? (Query Only)

Queries the delay from the input connector to the Zero Span output. The delay includes the propagation time through the entire system including filters and digital processing.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:DELay?
```

Arguments

None

Returns

`<NRf>` The actual delay of the signal through the system.

OUTPut:ZS:FILTer:STATe

Sets or queries the signal path of the filter to the Zero Span output.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:FILTer:STATe { AUTO | HIGH | LOW }
OUTPut:ZS:FILTer:STATe?
```

Arguments

`AUTO` The filter path is calculated internally.

`HIGH` Uses the high-band 10 MHz filter.

LOW Uses the low-band 100 kHz filter.

OUTPut:ZS[:STATe]

Determines whether to enable or disable the Zero Span output from the rear panel connector.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS[:STATe] { OFF | ON | 0 | 1 }
OUTPut:ZS[:STATe]?
```

Arguments

OFF or 0 disables the Zero Span output

ON or 1 enables the Zero Span output

Examples

OUTPUT:ZS:STATE ON enables on the Zero Span output.

OUTPut:ZS:VOLTage

Sets or queries the voltage level at the Zero Span output on the rear panel connector.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:VOLTage <value>
OUTPut:ZS:VOLTage?
```

Arguments

<value>::<NRf> voltage level at the Zero Span output connector.

OUTPut:ZS:VOLTage:AUTO

Sets or queries or queries how the output voltage is referenced.

Conditions

Measurement views: DPX, Spectrum

Group

Output commands

Syntax

```
OUTPut:ZS:VOLTage:AUTO { OFF | ON | 0 | 1 }
OUTPut:ZS:VOLTage:AUTO?
```

Arguments

`ON` or 1 sets the output voltage referenced to 1.0 V.

`OFF` or 0 allows users to scale down the output voltage from 0.5 V to 1.0 V.

Read commands

READ:ACPower? (Query Only)

Returns the Channel power and ACPR measurement results for all available channels.

Conditions

Measurement views: Channel power and ACPR

Group

Read commands

Syntax

```
READ:ACPower?
```

Arguments

None

Returns

`<chan_power>,<acpr_lower(1)>,<acpr_upper(1)>,`

`<acpr_lower(2)>,<acpr_upper(2)>,...`

`<acpr_lower(n)>,<acpr_upper(n)>`

Where

`<chan_power>` is the average power of the main channel as the power reference in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

`<acpr_lower(n)>` is the ACPR for the lower channel #n in dB.

`<acpr_upper(n)>` is the ACPR for the upper channel #n in dB.

The number of n depends on the setting of the `[SENSe]:ACPower:CHANnel:PAIRs` command.

Examples

`READ:ACPOWER?` might return 4.227,-28.420,-23.847,-22.316,-29.225, indicating

(average power of the main channel) = 4.227 dBm,

(ACPR for the lower channel 1) = -28.420 dB,

(ACPR for the upper channel 1) = -23.847 dB,

(ACPR for the lower channel 2) = -22.316 dB, and

(ACPR for the upper channel 2) = -29.225 dB.

READ:ACPower:CHANnel:POWer? (Query Only)

Returns the average power of the main channel (power reference) in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Read commands

Syntax

`READ:ACPower:CHANnel:POWer?`

Arguments

None

Returns

`<chan_power>::<NRf>` is the average power of the main channel in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:ACPOWER:CHANNEL:POWER?` might return 4.227, indicating that the average power of the main channel is 4.227 dBm.

READ:ACPower:SPECtrum? (Query Only)

Returns spectrum trace data of the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Read commands

Syntax

`READ:ACPower:SPECtrum?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the spectrum trace data in dBm for the point n, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:ACPOWER:SPECTRUM?` might return #43204xxxx... (3204-byte data) for the spectrum trace data of the Channel power and ACPR measurement.

READ:{AM|FM|PM}? (Query Only)

Returns the trace data in the AM/FM/PM measurement.

Conditions

Measurement views: AM, FM, PM

Group

Read commands

Syntax

`READ:{AM|FM|PM}?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the modulation factor in percent (AM), frequency deviation in Hz (FM), or phase deviation in degrees (PM) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:AM` might return #3156xxxx... (156-byte data) for the AM measurement trace.

READ:AM:AMINdex? (Query Only)

Returns the modulation index which is (positive peak modulation factor - negative peak modulation factor)/2, returned as a percentage (%).

Conditions

Measurement views: AM

Group

Read commands

Syntax

`READ:AM:AMINdex?`

Arguments

None

Returns

<value>::<NRf> the modulation index.

Examples

READ:AM:AMINDEX? might return 36.48, indicating the modulation index is 36.48%.

READ:AM:AMNegative? (Query Only)

Returns the negative peak modulation factor (−AM) in the AM measurement.

Conditions

Measurement views: AM

Group

Read commands

Syntax

READ:AM:AMNegative?

Arguments

None

Returns

<-AM>::<NRf> is the negative peak modulation factor in percent (%).

Examples

READ:AM:AMNEGATIVE? might return -23.4, indicating the negative peak modulation factor is −23.4%.

READ:AM:AMPositive? (Query Only)

Returns the positive peak modulation factor (+AM) in the AM measurement.

Conditions

Measurement views: AM

Group

Read commands

Syntax

READ:AM:AMPositive?

Arguments

None

Returns

<+AM>::<NRf> is the positive peak modulation factor in percent (%).

Examples

READ:AM:AMPOSITIVE? might return 43.8, indicating the positive peak modulation factor is 43.8%.

READ:AM:RESult? (Query Only)

Returns the AM measurement results.

Conditions

Measurement views: AM

Group

Read commands

Syntax

`READ:AM:RESult?`

Arguments

None

Returns

`<+AM>,<-AM>,<Total AM>`

Where

`<+AM>::<NRf>` is the positive peak modulation factor in percent (%).

`<-AM>::<NRf>` is the negative peak modulation factor in percent (%).

`<Total AM>::<NRf>` is the (peak to peak modulation factor)/2 in percent (%).

Examples

`READ:AM:RESULT?` might return `62.63,-50.89,56.76`.

READ:AUDio:FERRor? (Query Only)

Returns the carrier frequency error in the audio measurement. This command is only available for FM and PM measurements.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:FERRor?`

Arguments

None

Returns

`<value> ::= <NRf>` the carrier frequency error.

Examples

`READ:AUDIO:FERROR?` might return 419.9529809622 indicating that the audio frequency error is approximately 420 Hz.

READ:AUDio:FREQuency? (Query Only)

Returns the audio frequency.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:FREQuency?`

Arguments

None

Returns

`<value> ::= <NRf>` the audio frequency.

Examples

`READ:AUDIO:FREQUENCY?` might return 5.8239462705E+3 indicating that the audio frequency is 5.824 kHz.

READ:AUDio:HARMonic:COUNt? (Query Only)

Returns the number of harmonics in the audio spectrum measurement. The number of harmonics appear in the results table in the audio spectrum view.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:HARMonic:COUNt?`

Related Commands

READ:AUDio:NHARmonic:COUNt? (on page 1613)

Arguments

None

Returns

`<count> ::= <NR1>` the number of harmonics in the measurement view.

Examples

`READ:AUDIO:HARMONIC:COUNT?` might return 3 indicating that there are three harmonics in the measurement.

READ:AUDio:HARMonic<x>:AMPLitude? (Query Only)

Returns the amplitude of the specified harmonic in the audio spectrum measurement.

The value <x> represents the specific harmonic, from 1 to the value specified by the **CALCulate:AUDio:HARMonic:HNUMber** command.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:HARMonic<x>:AMPLitude?`

Related Commands

CALCulate:AUDio:HARMonic:HNUMber (on page 400)

Arguments

None

Returns

`<value> ::= <NRf>` the amplitude of the specified harmonic in dBc.

Examples

`READ:AUDio:HARMonic3:AMPLitude?` might return -2.861 indicating that amplitude of the third harmonic is -2.86 dBc.

READ:AUDio:HARMonic<x>:FREQuency? (Query Only)

Returns the frequency of the specified harmonic in the audio spectrum measurement.

The value <x> represents the specific harmonic, from 1 to the value specified by the `CALCulate:AUDio:HARMonic:HNUMber` command.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:HARMonic<x>:FREQuency?`

Related Commands

CALCulate:AUDio:HARMonic:HNUMber (on page 400)

Arguments

None

Returns

<value> ::= <NRF> the frequency of the specified harmonic.

Examples

READ:AUDio:HARMonic3:FREQuency? might return 17.4718007813E+3 indicating that the frequency of the third harmonic is 17.472 kHz.

READ:AUDio:HNOise? (Query Only)

Returns the difference between the current RMS modulation value and the reference value.

This information is only available when the Hum & Noise is measurement is enabled; see the [SENSe]:AUDio:HNOise:ENABle command. The reference value is stored after capturing the reference by pressing the Capture Reference button or by enabling the [SENSe]:AUDio:HNOise:REFerence command.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

READ:AUDio:HNOise?

Related Commands

[SENSe]:AUDio:HNOise:ENABle (on page 2023)

[SENSe]:AUDio:HNOise:REFerence (on page 2024)

Arguments

None

Returns

<value> ::= <NRF> specifies the difference between the Hum & Noise reference and the actual signal in dB.

Examples

READ:AUDIO:HNOISE? might return 0.00 dB indicating that there is no difference between the Hum & Noise reference and the actual signal.

READ:AUDio:HNREFerence? (Query Only)

Returns the Hum and Noise RMS modulation reference value.

The value is stored after capturing the reference by pressing the Capture Reference button or by enabling the [SENSe]:AUDio:HNOise:REFerence command. This information is only available when the Hum & Noise measurement is enabled; see the [SENSe]:AUDio:HNOise:ENABle command.

For AM signal types, the reference represents modulation depth. For FM signal types, the reference represents frequency deviation. For PM signal types the reference represents phase. For Direct signal types the reference represents power.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

```
READ:AUDio:HNREFerence?
```

Related Commands

[SENSe]:AUDio:HNOise:ENABle (on page 2023)

[SENSe]:AUDio:HNOise:REFerence (on page 2024)

Arguments

None

Returns

`<value> ::= <NRf>` the Hum & Noise reference frequency.

Examples

`READ:AUDIO:HNREFERENCE?` might return 20.581121E+3 indicating that the Hum & Noise reference frequency is 20.58 kHz.

READ:AUDio:HPTPeak? (Query Only)

Returns the half peak-to-peak modulation excursion (where the modulation excursion depends on the signal type).

For AM signal types, the modulation excursion is “% Modulation Depth.” For FM signal types, the modulation excursion is “Frequency Deviation.” For PM signal types, the modulation excursion is “Phase Deviation.” For Direct signal types, there is no modulation excursion; it is actually “signal excursion.”

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

```
READ:AUDio:HPTPeak?
```

Arguments

None

Returns

`<value> ::= <NRF>` specifies the half peak modulation excursion.

Examples

`READ:AUDIO:HPTPEAK?` might return 125.28231E+3 indicating that the half peak modulation excursion is 125.28 kHz.

READ:AUDio:MODDist? (Query Only)

Returns the modulation distortion for the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:MODDist?`

Arguments

None

Returns

`<value> ::= <NRf>` specifies the modulation distortion.

Examples

`READ:AUDIO:MODDIST?` might return 98.6282113 indicating that the modulation distortion is 98.628%.

READ:AUDio:NHARmonic:COUNt? (Query Only)

Returns the number of non-harmonics in the audio spectrum measurement.

The number of non-harmonics appear in the results table in the audio spectrum view.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:NHARmonic:COUNt?`

Related Commands

READ:AUDio:HARMonic:COUNt? (on page 1609)

Arguments

None

Returns

`<count> ::= <NR1>` the number of non-harmonics in the measurement view.

Examples

`READ:AUDIO:NHARMONIC:COUNT?` might return 7 indicating that there are seven harmonics in the measurement.

READ:AUDio:NHARmonic<x>:AMPLitude? (Query Only)

Returns the amplitude of the specified non-harmonic in the audio spectrum measurement.

The value <x> represents the specific non-harmonic, from 1 to the value specified by the `CALCulate:AUDio:HARMonic:NHNumber` command.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:NHARmonic<x>:AMPLitude?`

Related Commands

CALCulate:AUDio:HARMonic:NHNumber (on page 401)

Arguments

None

Returns

`<value> ::= <NRf>` the amplitude of the specified non-harmonic in dBc.

Examples

`READ:AUDio:NHARMonic3:AMPLitude?` might return -2.861 indicating that amplitude of the third non-harmonic is -2.86 dBc.

READ:AUDio:NHARmonic<x>:FREQuency? (Query Only)

Returns the frequency of the specified non-harmonic in the audio spectrum measurement.

The value <x> represents the specific non-harmonic, from 1 to the value specified by the **CALCulate:AUDio:HARMonic:NHNumber** command.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:NHARmonic<x>:FREQuency?`

Related Commands

CALCulate:AUDio:HARMonic:NHNumber (on page 401)

Arguments

None

Returns

`<value> ::= <NRF>` the frequency of the specified non-harmonic.

Examples

`READ:AUDio:NHARMonic3:FREQuency?` might return 17.4718007813E+3 indicating that the frequency of the third non-harmonic is 17.472 kHz.

READ:AUDio:PNEGative? (Query Only)

Returns the minus peak modulation excursion (where the modulation excursion depends on the signal type).

For AM signal types, the modulation excursion is “% Modulation Depth.” For FM signal types, the modulation excursion is “Frequency Deviation.” For PM signal types, the modulation excursion is “Phase Deviation.” For Direct signal types, there is no modulation excursion; it is actually “signal excursion.”

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:PNEGative?`

Arguments

None

Returns

Examples

`READ:AUDIO:PNEGATIVE?` might return -196.04321E+3 indicating that the minus peak modulation excursion is -196.04 kHz.

READ:AUDio:POWer? (Query Only)

Returns the carrier power or signal power depending the signal type.

If the signal type is Direct, the returned value is the average power of the input signal. If the signal type is AM, FM, or PM, the returned value is the carrier power; the average power of the carrier signal with the modulation removed.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:POWer?`

Arguments

None

Returns

`<value> ::= <NRf>` specifies the carrier or signal power in dBm.

Examples

`READ:AUDIO:POWER?` might return -22.231123 indicating that the carrier power is -22.23 dBm.

READ:AUDio:PPOSitive? (Query Only)

Returns the positive peak modulation excursion (where the modulation excursion depends on the signal type).

For AM signal types, the modulation excursion is “% Modulation Depth.” For FM signal types, the modulation excursion is “Frequency Deviation.” For PM signal types, the modulation excursion is “Phase Deviation.” For Direct signal types, there is no modulation excursion; it is actually “signal excursion.”

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:PPOSitive?`

Arguments

None

Returns

`<value> ::= <NRf>` specifies the positive peak modulation excursion.

Examples

`READ:AUDIO:PPOSITIVE?` might return 215.04321E+3 indicating that the positive peak modulation excursion is -215.04 kHz.

READ:AUDio:RMS? (Query Only)

Returns the RMS modulation excursion for the audio measurement (where the modulation excursion depends on the signal type).

For AM signal types, the modulation excursion is “% Modulation Depth.” For FM signal types, the modulation excursion is “Frequency Deviation.” For PM signal types, the modulation excursion is “Phase Deviation.” For Direct signal types, there is no modulation excursion; it is actually “signal excursion.”

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:RMS?`

Arguments

None

Returns

`<value> ::= <NRf>` specifies the RMS modulation excursion.

Examples

`READ:AUDIO:RMS?` might return 20.575039E+3 indicating that RMS modulation excursion is 20.575 kHz.

READ:AUDio:SINad? (Query Only)

Returns the signal-to-noise and distortion for the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:SINad?`

Arguments

None

Returns

`<value> ::= <NRf>` specifies the RMS modulation excursion.

Examples

`READ:AUDIO:SINAD?` might return 176.229024E-3 indicating that the signal-to-noise and distortion for the audio measurement is 0.18 dB.

READ:AUDio:SNOise? (Query Only)

Returns the signal level to noise level with the harmonic distortion and non-harmonic distortion components removed.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:SNOise?`

Arguments

None

Returns

`<value> ::= <NRf>` specifies the signal level to noise level.

Examples

`READ:AUDIO:SNOISE?` might return -12.8156364 indicating the signal level to noise level is -12.82 dB.

READ:AUDio:SPECtrum:TRACe<x>? (Query Only)

Returns the audio spectrum trace data for the audio measurement.

The <x> represents trace 1 for this measurement. No other traces are supported.

Conditions

Measurement views: Audio Spectrum

Group

Read commands

Syntax

`READ:AUDio:SPECtrum:TRACe<x>?`

Arguments

None

Returns

`#<num_digit><num_byte><date(1)><data(2)> . . . <data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating point format specifed in IEEE.488.2.

Examples

`READ:AUDio:SPECtrum:TRACe1?` might return #516004xxxx ... (16004 byte data) for the audio measurement.

READ:AUDio:THDist? (Query Only)

Returns the percentage of the total harmonic distortion in the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:THDist?`

Related Commands

READ:AUDio:THDist:DB? (on page 1619)

Arguments

None

Returns

`<value> ::= <NRf>` specifies the percentage of the total harmonic distortion.

Examples

`READ:AUDIO:THDIST?` might return `53.332921`, indicating the percentage of total harmonic distortion is 53.333%.

READ:AUDio:THDist:DB? (Query Only)

Returns the total harmonic distortion in dB in the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:THDist:DB?`

Related Commands

READ:AUDio:THDist? (on page 1618)

Arguments

None

Returns

`<value> ::= <NRf>` specifies the total harmonic distortion in dB.

Examples

`READ:AUDIO:THDIST:DB?` might return `-5.46009`, indicating that the total harmonic distortion is -5.46 dB.

READ:AUDio:TNHDist? (Query Only)

Returns the percentage of the total non-harmonic distortion in the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:TNHDist?`

Related Commands

READ:AUDio:TNHDist:DB? (on page 1620)

Arguments

None

Returns

`<value> ::= <NRf>` specifies the percentage of the total non-harmonic distortion.

Examples

`READ:AUDIO:TNHDIST?` might return `297.332921`, indicating the percentage of total non-harmonic distortion is 297.333%.

READ:AUDio:TNHDist:DB? (Query Only)

Returns the total non-harmonic distortion in dB in the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Read commands

Syntax

`READ:AUDio:TNHDist:DB?`

Related Commands

READ:AUDio:TNHDist? (on page 1619)

Arguments

None

Returns

`<value> ::= <NRf>` specifies the total non-harmonic distortion in dB.

Examples

`READ:AUDIO:TNHDIST:DB?` might return `9.46009`, indicating that the total harmonic distortion is 9.46 dB.

READ:AVTime[:MEASview<y>]:AVERage? (Query Only)

Returns the RMS (root-mean-square) value for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

`READ:AVTime[:MEASview<y>]:AVERage?`

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<avg>::<NRf>` is the RMS amplitude in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:AVTIME:MEASVIEW1:AVERAGE?` might return `-2.53`, indicating the RMS amplitude is -2.53 dBm on Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:{FIRSt|SECond|THIRd|FOURth}? (Query Only)

Returns the trace data in the Amplitude versus Time measurement.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the `TRACe<x>:AVTime[:MEASview<y>]` command subgroup.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

```
READ:AVTime[:MEASview<y>]:{FIRSt|SECond|THIRd|FOURth}?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude in dBm at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:AVTIME:MEASVIEW1:FIRST?` might return #3156xxxx... (156-byte data) for Trace 1 on Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MAXimum? (Query Only)

Returns the maximum value for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

```
READ:AVTime[:MEASview<y>]:MAXimum?
```

Related Commands

READ:AVTime[:MEASview<y>]:MAXLocation? (on page 1622)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<max>::<NRf>` is the maximum Amplitude in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:AVTIME:MEASVIEW1:MAXIMUM?` might return `-2.84`, indicating the maximum amplitude is -2.84 dBm for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MAXLocation? (Query Only)

Returns the time at which the amplitude is maximum for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

`READ:AVTime[:MEASview<y>]:MAXLocation?`

Related Commands

READ:AVTime[:MEASview<y>]:MAXimum? (on page 1625)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<max_time>::<NRf>` is the time at the maximum in seconds.

Examples

`READ:AVTIME:MEASVIEW1:MAXLOCATION?` might return 25.03E-9, indicating the amplitude is maximum at 25.03 ns on Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MINimum? (Query Only)

Returns the minimum value for the selected trace in the Amplitude versus Time measurement. Select the trace using the **TRACe<x>:AVTime[:MEASview<y>]:SELect** command.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

`READ:AVTime[:MEASview<y>]:MINimum?`

Related Commands

READ:AVTime[:MEASview<y>]:MINLocation? (on page 1622)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<min>::<NRf>` is the minimum amplitude in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:AVTIME:MEASVIEW1:MINIMUM?` might return -57.64, indicating the minimum amplitude is -57.64 dBm on Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MINLocation? (Query Only)

Returns the time at which the amplitude is minimum for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

`READ:AVTime[:MEASview<y>]:MINLocation?`

Related Commands

READ:AVTime[:MEASview<y>]:MINimum? (on page 1622)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<min_time>::<NRf>` is the time at the minimum in seconds.

Examples

`READ:AVTIME:MEASVIEW1:MINLOCATION?` might return 450.7E-9, indicating the amplitude is minimum at 450.7 ns on Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:RESult? (Query Only)

Returns the measurement results for the selected trace in the Amplitude versus Time measurement. Select the trace using the TRACe<x>:AVTime[:MEASview<y>]:SELect command.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

READ:AVTime[:MEASview<y>]:RESult?

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<max>,<max_time>,<min>,<min_time>,<rms>

Where

<max>::<NRf> is the maximum amplitude in dBm.

<max_time>::<NRf> is the time at the maximum in seconds.

<min>::<NRf> is the minimum amplitude in dBm.

<min_time>::<NRf> is the time at the minimum in seconds.

<rms>::<NRf> is the RMS amplitude in dBm.

The unit of amplitude can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:AVTIME:MEASVIEW1:RESULT? might return

-2.68,48.62E-6,-82.47,22.11E-6,-8.24, indicating that the maximum amplitude is -2.68 dBm at 48.62 µs, the minimum amplitude is -82.47 dBm at 22.11 µs, and the RMS amplitude is -8.24 dBm on Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:AVERage:{FIRSt|SECond|THIRd|FOURth}?

Returns the RMS (root-mean-square) value for the selected trace in the Amplitude versus Time measurement. Select the trace using the TRACe<x>:AVTime[:MEASview<y>]:SELect command.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the TRACe<x>:AVTime[:MEASview<y>] command subgroup.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

```
READ:AVTime[:MEASview<y>]:AVERage:{FIRSt|SECond|THIRd|FOURth}?
```

Related commands

READ:AVTime[:MEASview<y>]:MINimum:{FIRSt|SECond|THIRd|FOURth}? (on page 1626)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<avg>::<NRf>` is the RMS amplitude in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:AVTIME:MEASVIEW1:AVERAGE:FIRST?` might return -2.53, indicating the RMS amplitude is -2.53 dBm on Trace1 for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MAXimum:{FIRSt|SECond|THIRd|FOURth}?

Returns the maximum value for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the `TRACe<x>:AVTime[:MEASview<y>]` command subgroup.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

```
READ:AVTime[:MEASview<y>]:MAXimum:{FIRSt|SECond|THIRd|FOURth}?
```

Related commands

READ:AVTime[:MEASview<y>]:MAXLocation:{FIRSt|SECond|THIRd|FOURth}?

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<max>::<NRf>` is the maximum Amplitude in dBm.

The unit can be changed by the `[:SENSe]:POWer:UNITs` command.

Examples

`READ:AVTIME:MEASVIEW1:MAXIMUM:FIRST?` might return `-2.84`, indicating the maximum amplitude is -2.84 dBm on Trace1 for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MAXLocation:{FIRSt|SECond|THIRd|FOURth}?

Returns the time at which the amplitude is maximum for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the `TRACe<x>:AVTime[:MEASview<y>]` command subgroup.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

```
READ:AVTime[:MEASview<y>]:MAXLocation:{FIRSt|SECond|THIRd|FOURth}?
```

Related commands

READ:AVTime[:MEASview<y>]:MAXimum:{FIRSt|SECond|THIRd|FOURth}? (on page 1625)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<max>::<NRf>` is the maximum Amplitude in dBm.

Examples

`READ:AVTIME:MEASVIEW1:MAXLOCATION:FIRST?` might return `25.03E-9`, indicating the amplitude is maximum at 25.03 ns on Trace1 for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MINimum:{FIRSt|SECond|THIRd|FOURth}?

Returns the minimum value for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the `TRACe<x>:AVTime[:MEASview<y>]` command subgroup.

READ:AVTime[:MEASview<y>]:MINimum:{FIRSt|SECond|THIRd|FOURth}?
```

Related commands

READ:AVTime[:MEASview<y>]:MINLocation:{FIRSt|SECond|THIRd|FOURth}? (on page 1627)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<min>::<NRf> is the minimum amplitude in dBm. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:AVTIME:MEASVIEW1:MINIMUM:FIRST? might return -57.64, indicating the minimum amplitude is -57.64 dBm on Trace1 for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:MINLocation:{FIRSt|SECond|THIRd|FOURth}?

Returns the time at which the amplitude is minimum for the selected trace in the Amplitude versus Time measurement. Select the trace using the TRACe<x>:AVTime[:MEASview<y>]:SELect command.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the TRACe<x>:AVTime[:MEASview<y>] command subgroup.

Conditions

READ:AVTime[:MEASview<y>]:MINLocation:{FIRSt|SECond|THIRd|FOURth}?

Related commands

READ:AVTime[:MEASview<y>]:MINimum:{FIRSt|SECond|THIRd|FOURth}? (on page 1626)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<min>::<NRf> is the minimum amplitude in dBm. The unit can be changed by the [:SENSe]:POWer:UNITs command.

Examples

READ:AVTIME:MEASVIEW1:MINLOCATION:FIRST? might return 450.7E-9, indicating the amplitude is minimum at 450.7 ns on Trace1 for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:OGRAm? (Query only)

Returns the ogram trace data. The line is selected using the TRACe:AVTime:MEASview<y>:OGRAm:SELect:LINE command.

Conditions

Applicable measurement view must be active.

Group

Read commands

Syntax

`READ:AVTime[:MEASview<y>]:OGRAm?`

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in <num_byte>.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the trace data in dBm for the point n, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:AVTime:MEASview1:OGRAm?` might return #43204xxxx... (3204-byte data) for the ogram trace.

READ:AVTime[:MEASview<y>]:RESult:{FIRSt|SECond|THIRd|FOURth}?

Returns the measurement results for the selected trace in the Amplitude versus Time measurement. Select the trace using the `TRACe<x>:AVTime[:MEASview<y>]:SELect` command.

The mnemonics FIRSt, SECond, THIRd, and FOURth represent Trace 1, Trace 2, Trace 3, and Math trace, respectively. The traces can be specified by the `TRACe<x>:AVTime[:MEASview<y>]` command subgroup.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

`READ:AVTime[:MEASview<y>]:RESult:{FIRSt|SECond|THIRd|FOURth}?`

Related commands

READ:AVTime[:MEASview<y>]:MINimum:{FIRSt|SECond|THIRd|FOURth}? (on page 1626)

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<max>,<max_time>,<min>,<min_time>,<rms>

Where

<max>::<NRf> is the maximum amplitude in dBm.

<max_time>::<NRf> is the time at the maximum in seconds.

<min>::<NRf> is the minimum amplitude in dBm.

<min_time>::<NRf> is the time at the minimum in seconds.

<rms>::<NRf> is the RMS amplitude in dBm.

The unit of amplitude can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:AVTIME:MEASVIEW1:RESULT:FIRST? might return -2.68,48.62E-6,-82.47,22.11E-6,-8.24, indicating that the maximum amplitude is -2.68 dBm at 48.62 µs, the minimum amplitude is -82.47 dBm at 22.11 µs, and the RMS amplitude is -8.24 dBm on Trace1 for Amplitude versus Time Measurement View 1.

READ:AVTime[:MEASview<y>]:TRACe:BITMap? (Query Only)

Acquires a waveform and then returns trace waveform data of the bitmap trace in the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Read commands

Syntax

READ:AVTime[:MEASview<y>]:TRACe:BITMap?

Arguments

None

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

The format is a binary block of 32 bit floating point values. Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Examples

READ:AVTIME:TRACE:BITMAP? might return #42004xxxx... (2004-byte data) for the waveform data of the bitmap trace.

READ:BIBEmissions:FTX? (Query Only)

Returns the band number corresponding to the transmitted FTX detected in the Bluetooth InBand Emission display.

Conditions

Measurement views: Bluetooth InBand Emission

Group

Read commands

Syntax

`READ:BIBEmissions:FTX?`

Arguments

None

Returns

`<value> ::= <NR1>` the band number.

Examples

`READ:BIBEMISSIONS:FTX?` might return `39`, indicating the band number corresponding to transmitted FTX.

READ:BIBEmissions:POWer? (Query Only)

Returns all channel power results from the Bluetooth InBand Emission display.

Conditions

Measurement views: Bluetooth InBand Emission

Group

Read commands

Syntax

`READ:BIBEmissions:POWer?`

Arguments

None

Returns

`<Band0_power>,<Band1_power>,<Band2_power>, . . . <Band78_power>`

Where:

`Bandx_power` is the integrated power in that band. All power values are in dBm

Examples

`READ:BIBEMISSIONS:POWER?` might return `4.227,-28.420,-23.847, . . . ,-29.225`, indicating: (integrated power for Band 0) = 4.227 dBm,

(Integrated power for Band 1) = -28.420 dBm,

(Integrated power for Band 2) = -23.847 dBm, and

(Integrated power for Band 78) = -29.225 dBm.

READ:BIBEmissions:RESUlts:STATus? (Query Only)

Returns the Pass/Fail result status of the Bluetooth InBand Emission display.

Conditions

Measurement views: Bluetooth InBand Emission

Group

Read commands

Syntax

`READ:BIBEmissions:RESUlts:STATus?`

Arguments

None

Examples

`READ:BIBEMISSIONS:RESULTS:STATUS?` returns the Pass/Fail status result on the display.

READ:BLUEtooth:CONSte:FERRor? (Query Only)

Queries the frequency error in Hz in the Bluetooth Constellation. The frequency error is the difference between the measured carrier frequency of the signal and the user-selected center frequency.

Conditions

Measurement views: Bluetooth Constellation

Group

Read commands

Syntax

`READ:BLUEtooth:CONSte:FERRor?`

Arguments

None

Returns

`<freq_error> ::= <NRf>` the frequency error.

Examples

`READ:BLUEtooth:CONSte:FERRor?` might return `-10.7E+3`, which is a frequency error of -10.7 kHz.

READ:BLUEtooth:CONSte:TRACe? (Query Only)

Queries the Bluetooth Constellation trace data.

Conditions

Measurement views: Bluetooth Constellation

Group

Read commands

Syntax

`READ:BLUEtooth:CONSte:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><I(1)><Q1><I(2)><Q2> . . . <I(n)><Qn>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<I(n)>` and `<Qn>` are the normalized I- and Q-coordinate values at the nth data point. 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:BLUEtooth:CONSte:TRACe?` might return `#43848xxxx . . .` (3848-byte data) for Bluetooth Constellation trace.

READ:BLUEtooth:EDIagram:FDEViation? (Query Only)

Returns the frequency deviation vs. time trace data with the X values in the Bluetooth eye diagram.

Conditions

Measurement views: Bluetooth eye diagram.

Group

Read commands

Syntax

`READ:BLUEtooth:EDIagram:FDEViation?`

Arguments

None

Returns

`#<num_digits><num_bytes><Y(1)><X(1)><Y(2)><X(2)> . . . <Y(n)><X(n)>`

Where

`<num_digits>` is the number of bytes in `<num_bytes>`.

`<num_bytes>` is the number of bytes of data that follow.

`<Y(1)>` and `<X(1)>` are the normalized I- and Q-coordinate values at the nth datapoint. The 4-byte little endian floating point format is specified in IEEE 488.2.

Examples

`READ:BLUEtooth:EDIagram:FDEVIiation?` might return #3160xxxx... (160-byte data) for the frequency deviation versus time trace.

READ:BLUEtooth:EDIagram:FERRor? (Query Only)

Returns the frequency error in the Bluetooth eye diagram measurement.

Conditions

Measurement views: Bluetooth eye diagram.

Group

Read commands

Syntax

`READ:BLUEtooth:EDIagram:FERRor?`

Arguments

None

Returns

`<freq_error> ::= <NRf>` the frequency error in Hz.

Examples

`READ:BLUEtooth:EDIagram:FERRor?` might return `-10.7E+3`, indicating the frequency error is -10.7 kHz.

READ:BLUEtooth:EDIagram:HORiz:SCALe? (Query Only)

Returns the value of the horizontal scale in the Bluetooth eye diagram.

Conditions

Measurement views: Bluetooth eye diagram.

Group

Read commands

Syntax

`READ:BLUEtooth:EDIagram:HORiz:SCALe?`

Arguments

None

Returns

`<value> ::= <NR3>` the horizontal scale value.

Examples

`READ:BLUETOOTH:EDIAGRAM:HORIZ:SCALE?` might return `2` indicating the horizontal scale value is 2 symbols.

READ:BLUEtooth:EDIagram:I? (Query Only)

Returns the I vs. time trace in the Bluetooth eye diagram.

Conditions

Measurement views: Bluetooth eye diagram.

Group

Read commands

Syntax

`READ:BLUEtooth:EDIagram:I?`

Arguments

None

Returns

#<num_digits><num_bytes><Y(1)><X(1)><Y(2)><X(2)> . . . <Y(n)><X(n)>

Where

<num_digits> is the number of bytes in <num_bytes>.

<num_bytes> is the number of bytes of data that follow.

<Y(1)> and <X(1)> are the normalized I- and Q-coordinate values at the nth datapoint. The 4-byte little endian floating point format is specified in IEEE 488.2.

Examples

READ:BLUEtooth:EDIagram:I? might return #3160xxxx... (160-byte data) for the I vs. time trace.

READ:BLUEtooth:EDIagram:Q? (Query Only)

Returns the Q vs. time trace in the Bluetooth eye diagram.

Conditions

Measurement views: Bluetooth eye diagram.

Group

Read commands

Syntax

READ:BLUEtooth:EDIagram:Q?

Arguments

None

Returns

#<num_digits><num_bytes><Y(1)><X(1)><Y(2)><X(2)> . . . <Y(n)><X(n)>

Where

<num_digits> is the number of bytes in <num_bytes>.

<num_bytes> is the number of bytes of data that follow.

<Y(1)> and <X(1)> are the normalized I- and Q-coordinate values at the nth datapoint. The 4-byte little endian floating point format is specified in IEEE 488.2.

Examples

READ:BLUEtooth:EDIagram:Q? might return #3160xxxx... (160-byte data) for the Q vs. time trace.

READ:BLUEtooth:FDVTime:TRACe? (Query Only)

Returns the Bluetooth Frequency Deviation vs. Time trace data.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FDVTime:TRACe?`

Arguments

None

Returns

`#<num_digits><num_bytes><data(1)><data(2)> . . . <data(n)>`

Where

`.<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the frequency deviation in Hz at the nth datapoint. The 4-byte little endian floating point format is specified in IEEE 488.2.

Examples

`READ:BLUEtooth:FDVTime:TRACe?` might return `#3160xxxx...` (160-byte data) for the trace.

READ:BLUEtooth:FREQuency:ERROr? (Query Only)

Returns the frequency error from the Bluetooth Constellation diagram.

Conditions

Measurement views: Bluetooth Constellation

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:ERROr?`

Arguments

None

Returns

`<NR3>`, the frequency error value in Hz.

Examples

`READ:BLUETOOTH:FREQUENCY:ERROR?` might return `0.0000`, indicating the frequency error is 0.0000 Hz.

READ:BLUEtooth:FREQuency:ERROr:TYPE

Returns the frequency error type in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:ERROr:TYPE`

Arguments

None

Returns

1 indicates the error is automatically detected.

0 indicates the error is not automatically detected.

Examples

`READ:BLUETOOTH:FREQUENCY:ERROR:TYPE` might return `1`, indicating the frequency error is automatically detected.

READ:BLUEtooth:FREQuency:OFFSet:DRIFt:F1FZero? (Query Only)

Returns the drift in frequency offset (f1−f0 − the frequency offset calculated in the first interval in the payload − the frequency offset calculated in the preamble) in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:F1FZero?`

Arguments

None

Returns

`<NR3>` the drift in frequency offset (f1−f0 − the frequency offset calculated in the first interval in the payload − the frequency offset calculated in the preamble)

Examples

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:F1FZero?` might return `−207.6465301514` indicating the drift in frequency offset (f1-f0 − the frequency offset calculated in the first interval in the payload − the frequency offset calculated in the preamble).

READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFN5? (Query Only)

Returns the maximum drift of the frequency offset in payload intervals spaced 50 µs away in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFN5?`

Arguments

None

Returns

`<NR3>` the maximum drift of the frequency offset in payload intervals spaced 50 µs away.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNF5?` might return `-207.6465301514`, indicating the maximum drift of the frequency offset in payload intervals spaced 50 µs away.

READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFN5:INTErval? (Query Only)

Returns the interval at which the maximum drift of frequency offset in a duration of 50 µs occurred.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFN5:INTErval?`

Arguments

None

Returns

`<NR1>` interval at which the maximum drift of frequency offset in a duration of 50 µs occurred.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNF5:INTErval?` might return `16`, indicating the interval at which the maximum drift of frequency offset in a duration of 50 µs occurred. Here 16 refers to the 16th interval and that the drift of frequency offset calculated in the 16th interval from that calculated in the 11th interval is the maximum among those calculated 50 µs away.

READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFZERO? (Query Only)

Returns the maximum drift of the frequency offset of the intervals in the payload from the preamble packet in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFZERO?`

Arguments

None

Returns

`<NR3>` the maximum drift of frequency offset calculated in payload intervals from the offset calculated in the preamble.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFZero?` might return `-207.6465301514`, indicating that the maximum drift of frequency offset calculated in payload intervals from the offset calculated in the preamble is -207.6465301515 Hz.

READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFZERO:INTErval? (Query Only)

Returns the interval (n) at which the maximum drift fn-f0 occurred in the Bluetooth Frequency Deviation vs. Time display. (The fn-f0 indicates the drift of the frequency offset calculated in each payload interval from the offset calculated in the preamble.)

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFZERO:INTErval?`

Arguments

None

Returns

`<NR1>` the interval at which the maximum drift (fn-f0) occurred.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:DRIFt:FNFZero:INTErval?` might return `16`, indicating that at the 16th payload interval, the maximum drift occurred. f(16) - f(0) is the maximum drift among all f(n) -f (0).

READ:BLUEtooth:FREQuency:OFFSet:MAX? (Query Only)

Returns the maximum frequency offset in the Frequency Deviation vs. Time and the Center Frequency Offset and Drift displays.

Conditions

Measurement views: Frequency Deviation vs. Time, CF Offset

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:MAX?`

Arguments

None

Returns

`<NR3>` the maximum frequency offset value.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:MAX?` might return `-189.4632263184`, the frequency offset value.

READ:BLUEtooth:FREQuency:OFFSet:MAX:INTErval? (Query Only)

Returns the maximum frequency offset interval in the Frequency Deviation vs. Time and the Center Frequency Offset and Drift displays.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:MAX:INTErval?`

Arguments

None

Returns

`<NR1>` the maximum frequency offset interval.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:MAX:INTErval?` might return `271`, indicating that the maximum drift f(n) - f(0) occurred at the 271st payload interval.

READ:BLUEtooth:FREQuency:OFFSet:PREAmble? (Query Only)

Returns the offset calculated in the preamble region in the Frequency Deviation vs. Time and the Center Frequency Offset and Drift displays.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:FREQuency:OFFSet:PREAmble?`

Arguments

None

Returns

`<NR3>` the offset calculated in the preamble region.

Examples

`READ:BLUEtooth:FREQuency:OFFSet:PREAmble?` might return `106.4204711914`, indicating the offset calculated in the preamble region.

READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:F? (Query Only)

Returns the average frequency value when the selected test pattern is Other in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

`READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:F?`

Arguments

None

Returns

`<NRf>` the average frequency.

Examples

`READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:F?` might return `140.8309531250E+3`, the average frequency value.

READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:F2F1ratio? (Query Only)

Returns the average ratio value for the high and low frequency deviation in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

```
READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:F2F1ratio?
```

Arguments

None

Returns

<NR1> the average ratio value.

Examples

READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:F2F1ratio? might return ????, the average ratio value.

READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:FONE? (Query Only)

Returns the average frequency deviation for the low deviation pattern in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

```
READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:FONE?
```

Arguments

None

Examples

READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:FONE? might return 139.8309531250E+3, the average frequency deviation for the low deviation pattern.

READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:FTWO? (Query Only)

Returns the average frequency deviation for the high deviation pattern in the Bluetooth Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Read commands

Syntax

```
READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:FTWO?
```

Arguments

None

Examples

`READ:BLUEtooth:MODUlation:CHARacteristics:AVErage:FTWO?` might return `139.8309531250E+3`, the average frequency deviation for the high deviation pattern.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:COUNt? (Query Only)

Returns the number of packets analyzed to obtain average drift results from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

```
READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:COUNt?
```

Arguments

None

Returns

`<NR1>` the number of packets analyzed.

Examples

`READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:COUNT?` might return `8`, the number of packets analyzed.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:F1FZero? (Query Only)

Returns the drift f1−f0 from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

```
READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:F1FZero?
```

Arguments

None

Returns

<NRf> the drift f1−f0 value.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:F1FZERO? might return 2.846E+3 indicating that the drift f1-f0 value is 2.846 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:F1FZero:STATus? (Query Only)

Returns the Pass/Fail drift f1−f0 result status in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:F1FZero:STATus?

Arguments

None

Returns

<string> the Pass/Fail result status.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:F1FZERO:STATUS? might return PASS, FAIL, or NA indicating whether the drift f1−f0 is within the specified limit.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFN5? (Query Only)

Returns the maximum drift of the fn−fn-5 value from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFN5?

Arguments

None

Returns

<NRf> the fn−fn-5 value.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:FNFN5? might return 2.846E+3 indicating that the maximum drift fn−fn-5 value in the preamble region is -2.846 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFN5:STATus? (Query Only)

Returns the Pass/Fail status of the maximum fn−fn-5 drift in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFN5:STATus?

Arguments

None

Returns

<string> the Pass/Fail result status.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:FNFN5:STATUS? might return PASS, FAIL, or NA indicating whether the maximum drift fn−fn−5 is within the specified limit.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFZero? (Query Only)

Returns the maximum drift fn−f0 from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFZero?

Arguments

None

Returns

<NRf> the fn−fn0 value.

Examples

`READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:FNFZERO?` might return 4.846E+3 indicating that the drift fn−f0 value in the preamble region is 4.846 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFZero:STATus? (Query Only)

Returns the Pass/Fail result status of the fn−f0 maximum drift in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:FNFZero:STATus?`

Arguments

None

Returns

`<string>` the Pass/Fail result status.

Examples

`READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:FNFZERO:STATUS?` might return PASS, FAIL, or NA indicating whether the maximum drift fn−f0 is within the specified limit.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:CODIng:SCHEme (Query Only)

Returns the offset drift coding scheme value (LE Coded) in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:CODIng:SCHEme?`

Arguments

None

Returns

`<NR1>` 2 or 8

Where 2 is data at 500 Kb/s and 8 is 125 Kb/s

Examples

`READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:CODING:SCHEME` might return `"8"`, indicating the offset drift coding scheme value is 8.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F0FThree (Query Only)

Returns the Drift value f0-f3 for LE Coded in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F0FThree?`

Arguments

None

Returns

`<NRf>` Maximum Frequency value in kHz

Examples

`READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:F0FTHREE` might return `207.2 kHz`, indicating the f0-f3 drift value is 207.2 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F0FThree:STATus (Query Only)

Returns the Drift value Status of f0-f3 for LE Coded in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F0FThree:STATus?`

Arguments

None

Returns

`<String>` PASS , FAIL or NA

`PASS` indicates that the test passed

FAIL indicates that the test failed

NA indicates that the test is not Applicable

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:F0FTHREE:STATUS might return Pass, indicating the Drift value Status of f0-f3 was Pass.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F1FFour (Query Only)

Returns the Drift value of f1-f4 for LE Coded in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F1FFour?

Arguments

None

Returns

<NRf> Maximum Frequency value in kHz

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:F1FFOUR might return -10.22 kHz, indicating the f1-f4 drift value is -10.22 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F1FFour:STATus (Query Only)

Returns the Drift value Status of f1-f4 for LE Coded in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:F1FFour:STATus?

Arguments

None

Returns

<String> PASS , FAIL or NA

PASS indicates that the test passed

FAIL indicates that the test failed

NA indicates that the test is not Applicable

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:F1FFOUR:STATUS might return Pass, indicating the Drift value Status of f1-f4 was Pass.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:FNFN3 (Query Only)

Returns the Drift value of fn-f(n-3) for LE Coded in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:FNFN3?

Arguments

None

Returns

<NRf> Maximum Frequency value in kHz

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:FNFN**3** might return -10.42 kHz, indicating the fn-f(n-3) drift value is -10.42 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:FNFN3:STATus (Query Only)

Returns the Drift value Status of fn-f(n-3) for LE Coded in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:DRIFt:LECoded:FNFN3:STATus?

Arguments

None

Returns

<String> PASS , FAIL or NA

PASS indicates that the test passed

FAIL indicates that the test failed

NA indicates that the test is not Applicable

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:DRIFT:LECODED:FNFN3:STATUS might return Pass, indicating the Drift value Status of fn-f(n-3) was Pass.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:MAX? (Query Only)

Returns the maximum frequency offset present in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:MAX?

Arguments

None

Returns

<NRf> the maximum frequency offset value in the packet.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:MAX? might return 7.446E+3, indicating that the maximum frequency offset value in the packet is 7.446 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:MAX:STATus? (Query Only)

Returns the Pass/Fail result status of the frequency offset maximum in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:MAX:STATus?

Arguments

None

Returns

<string> the Pass/Fail result status.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:MAX:STATUS? might return PASS, FAIL, or NA, indicating whether the maximum frequency offset in the packet is within the specified limit.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:PREAmble? (Query Only)

Returns the frequency offset value in the preamble region from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:PREAmble?

Arguments

None

Returns

<NRf> the frequency offset value in the preamble region.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:PREAMBLE? might return 3.546E+3, indicating that the frequency offset value in the preamble region is 3.546 kHz.

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:PREAmble:STATus? (Query Only)

Returns the Pass/Fail result status of the frequency offset in the preamble region.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:FREQuency:OFFSet:PREAmble:STATus?

Arguments

None

Returns

<string> the Pass/Fail result status.

Examples

READ:BLUETOOTH:SUMMARY:FREQUENCY:OFFSET:PREAMBLE:STATUS? might return PASS, FAIL, or NA, indicating whether the frequency offset in the preamble region is within the specified limit.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:F:MAX:PERCentage:COUNt? (Query Only)

Returns the number of packets analyzed out of 10 packets for ΔFavg from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:F:MAX:PERCentage:COUNt?

Arguments

None

Returns

<NR1> the number of packets analyzed.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:DELTA:F:MAX:PERCENTAGE:COUNT? might return 3, indicating that three packets were analyzed.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FONE:MAX:PERCentage:COUNt? (Query Only)

Returns the number of packets analyzed out of 10 packets for the ΔF1avg from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FONE:MAX:PERCentage:COUNt?

Arguments

None

Returns

<NR1> the number of packets analyzed.

Examples

`READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:DELTA:FONE:MAX:PERCENTAGE:COUNT?` might return 6 indicating that six packets were analyzed.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FTWO:MAX:PERCentage? (Query Only)

Returns the percentage of the ΔF2max% values that are above the specified limit.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FTWO:MAX:PERCentage?`

Arguments

None

Returns

`<NRf>` the number of packets analyzed.

Examples

`READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:DELTA:FTWO:MAX:PERCENTAGE?` might return 99.2 indicating that 99.2% of the deltaF2 maximum values are above the specified limit.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FTWO:MAX:PERCentage:COUNt? (Query Only)

Returns the number of packets analyzed out of 10 packets for delta F2 average from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FTWO:MAX:PERCentage:COUNt?`

Arguments

None

Returns

`<NR1>` the number of packets analyzed.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:DELTA:FTWO:MAX:PERCENTAGE:COUNT? might return 6 indicating that six packets were analyzed.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FTWO:MAX:PERCentage:STATus? (Query Only)

Returns the Pass/Fail result status of the ΔF2Max% field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:DELTa:FTWO:MAX:PERCentage:STATus?

Arguments

None

Returns

<string> the Pass/Fail result status.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:DELTA:FTWO:MAX:PERCENTAGE:STATUS? might return PASS, FAIL, or NA indicating the Pass/Fail status of the ΔF2Max% field in the Bluetooth summary.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:F2F1ratio? (Query Only)

Returns the ratio of the ΔF2avg to ΔF1avg from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:F2F1ratio?

Arguments

None

Returns

<NRf> the value of the ΔF1avg to ΔF2avg ratio.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:F2F1RATIO? might return 225.12E+3, indicating the average ratio is 22.5.12 kHz.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:F2F1ratio:STATus? (Query Only)

Returns the Pass/Fail results status of the ΔF2avg/ΔF1avg field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:F2F1ratio:STATus?

Arguments

None

Returns

<string> the Pass/Fail result status.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:F2F1RATIO:STATUS? might return PASS, FAIL, or NA, indicating the Pass/Fall result status of the ΔF2avg/ΔF1avg field.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:F? (Query Only)

Returns the ΔFavg value from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:F?

Arguments

None

Returns

<NRf> the ΔFavg value.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:F? might return 2.8723E+3, indicating the ΔFavg is 2.8723 kHz.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:FONE? (Query Only)

Returns the delta F1 average value from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:FONE?

Arguments

None

Returns

<NRf> the delta F1 value.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:FONE? might return 155.3672E+3, indicating the delta F1 average is 155.3672 kHz.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:FONE:STATus? (Query Only)

Returns the Pass/Fail results status of the delta F1 average from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:FONE:STATus?

Arguments

None

Returns

<string> the Pass/Fail results status.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:FONE:STATUS? might return PASS, FAIL, or NA, indicating whether the delta F1 average is within the limit.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:FTWO? (Query Only)

Returns the delta F2 average value from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:AVErage:FTWO?

Arguments

None

Returns

<NRf> the delta F1 value.

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:AVERAGE:FTWO? might return 225.12E+3, indicating that the delta F2 value is 225.12 kHz.

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:INDex (Query Only)

Returns the Modulation index value in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:MODUlation:CHARacteristics:INDex?

Arguments

None

Returns

<String>

Examples

READ:BLUETOOTH:SUMMARY:MODULATION:CHARACTERISTICS:INDEX might return "Stable", indicating the status of modulation index is Stable.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:AVErage? (Query Only)

Returns the average output power from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:OUTPut:POWEr:AVErage?

Arguments

None

Returns

<NRf> the average output power value in dBm.

Examples

READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:AVERAGE? might return -29.1 indicating that the average output power is -29.1 dBm.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:AVErage:STATus? (Query Only)

Returns the Pass/Fail results status of the average output power from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:OUTPut:POWEr:AVErage:STATus?

Arguments

None

Returns

<string> the Pass/Fail results status.

Examples

READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:AVERAGE:STATUS? might return PASS, FAIL, or NA indicating whether the average output power is within the specified limit.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:COUNt? (Query Only)

Returns the number of packets analyzed out of 10 packets for the calculation of the output power from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:OUTPut:POWEr:COUNt?`

Arguments

None

Returns

`<NR1>` the number of packets analyzed.

Examples

`READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:COUNT?` might return 6 indicating that six packets were analyzed.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:EDR:COUNt? (Query Only)

Returns the number of packets analyzed out of 10 packets for calculation of the output power for EDR from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:OUTPut:POWEr:EDR:COUNt?`

Arguments

None

Returns

`<NR1>` the number of packets analyzed.

Examples

`READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:EDR:COUNT?` might return `6` indicating that six packets were analyzed.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:EDR:DPSK? (Query Only)

Returns the power in the DPSK portion of the EDR burst from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:OUTPut:POWEr:EDR:DPSK?`

Arguments

None

Returns

`<NRf>` the power in the DPSK portion of the EDR burst.

Examples

`READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:EDR:DPSK?` might return `-29.2`, indicating that the average output power is -29.2 dBm.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:EDR:GPSK? (Query Only)

Returns the power in the GFSK portion of the EDR burst from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:OUTPut:POWEr:EDR:GPSK?`

Arguments

None

Returns

`<NRf>` the power in the GFSK portion of the EDR burst.

Examples

`READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:EDR:GPSK?` might return `-29.1`, indicating that the average output power is -29.1 dBm.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:PEAK? (Query Only)

Returns the peak output power from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:OUTPut:POWEr:PEAK?`

Arguments

None

Returns

`<NRf>` the peak output power value in dBm.

Examples

`READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:PEAK?` might return `-29.3`, indicating that the peak output power is -29.3 dBm.

READ:BLUEtooth:SUMMary:OUTPut:POWEr:PEAK:STATus? (Query Only)

Returns the Pass/Fail results status of the peak output power from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:OUTPut:POWEr:PEAK:STATus?`

Arguments

None

Returns

`<string>` the Pass/Fail result status.

Examples

`READ:BLUETOOTH:SUMMARY:OUTPUT:POWER:PEAK:STATUS?` might return `PASS`, `FAIL`, or `NA`, indicating whether the peak output power is within the specified limit.

READ:BLUEtooth:SUMMary:PACKet:BDR:CRC? (Query Only)

Returns the Basic Rate value of the CRC field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:CRC?`

Arguments

None

Returns

`<string>` the value of the CRC field.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:CRC?` might return `"0x9DB0"` indicating the value of the CRC field in hexadecimal.

READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:ARQN? (Query Only)

Returns the value of ARQN field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:ARQN?`

Arguments

None

Returns

`<NR2>` the value of the ARQN field.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:HEADer:ARQN?` might return `0.000000`, indicating the value of the flow field.

READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:FLOW? (Query Only)

Returns the value of Flow field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:FLOW?`

Arguments

None

Returns

`<NR2>` the flow value.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:HEADer:FLOW?` might return `1.000000`, indicating the value of the flow field.

READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:HEC? (Query Only)

Returns the value of HEC field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:HEC?`

Arguments

None

Returns

`<string>` the value of the HEC field.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:HEADer:HEC?` might return `"00110010"` indicating the value of the HEC field in binary.

READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:LT:ADDRess? (Query Only)

Returns the LT address from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:LT:ADDRess?`

Arguments

None

Returns

`<string>` the LT address.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:HEADer:LT:ADDR?` might return `"101"` indicating the LT address in binary.

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:SN (Query Only)

Returns the SN value (1 bit) under decoded packet information when the packet type is “OTHERS” for Low Energy in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:SN?`

Arguments

None

Returns

`<Boolean>` 0, 1

Examples

`READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:SN` might return 1, indicating the value of SN is "1".

READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:SEQN? (Query Only)

Returns the value of SEQN field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:SEQN?`

Arguments

None

Returns

`<NR2>` the value of the SEQN field.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:HEADer:SEQN?` might return 1.000000 indicating the value of the flow field.

READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:TYPE? (Query Only)

Returns the value of Type field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BDR:HEADer:TYPE?`

Arguments

None

Returns

`<string>` the value of the type field.

Examples

`FETCh:BLUEtooth:SUMMary:PACKet:BDR:HEADer:TYPE?` might return `"00001111"` indicating the type field in binary.

READ:BLUEtooth:SUMMary:PACKet:BDR:PAYLoad:LENgth? (Query Only)

Returns the Basic Rate payload length from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax
`READ:BLUEtooth:SUMMary:PACKet:BDR:PAYLoad:LENgth?`

Arguments
None

Returns
`<string>` the value of the payload length.

Examples
`FETCh:BLUEtooth:SUMMary:PACKet:BDR:PAYLoad:LENgth?` might return `"0101010011"` indicating the payload length value in binary.

READ:BLUEtooth:SUMMary:PACKet:BDR:PREAmble? (Query Only)
Returns the preamble of the Basic Rate packet from the Bluetooth summary.

Conditions
Measurement views: Bluetooth summary

Group
Read commands

Syntax
`READ:BLUEtooth:SUMMary:PACKet:BDR:PREAmble?`

Arguments
None

Returns
`<string>` the preamble of the packet.

Examples
`FETCh:BLUEtooth:SUMMary:PACKet:BDR:PREAmble?` might return `"0101"` indicating the preamble is 0101 in binary.

READ:BLUEtooth:SUMMary:PACKet:BDR:SYNC:WORD? (Query Only)
Returns the sync word from the Bluetooth summary.

Conditions
Measurement views: Bluetooth summary

Group
Read commands

Syntax
`READ:BLUEtooth:SUMMary:PACKet:BDR:SYNC:WORD?`

Arguments

None

Returns

<string> the sync word.

Examples

FETCh:BLUEtooth:SUMMary:PACKet:BDR:SYNC:WORD? might return "Ox4F36F2CEE85390CB" indicating the sync word in hexadecimal format.

READ:BLUEtooth:SUMMary:PACKet:BDR:TYPE? (Query Only)

Returns the packet type of the Basic Rate signal from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BDR:TYPE?

Arguments

None

Returns

<string> the packet type.

Examples

FETCh:BLUEtooth:SUMMary:PACKet:BDR:TYPE? might return "DH5" indicating that the DH5 packet is being analyzed.

READ:BLUEtooth:SUMMary:PACKet:BLE:ACCEss:ADDRess? (Query Only)

Returns the 32-bit Access Address from the Bluetooth Summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:ACCEss:ADDRess?

Arguments

None

Returns

<string> the 32-bit Access Address.

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:ACCESS:ADDRESS? might return "0x71764129" indicating the Access Address in hexadecimal.

READ:BLUEtooth:SUMMary:PACKet:BLE:CRC? (Query Only)

Returns the value of the CRC field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:CRC?

Arguments

None

Returns

<string> the value of the CRC field.

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:CRC? might return "0x9DB0" indicating value CRC field in hexadecimal.

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:CHANnel:SELect (Query Only)

Returns the channel selected under decoded packet information section in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:CHANnel:SELect?

Arguments

None

Returns

<String> 0 or 1 or -1 or "-"

0 and 1 represents valid

-1 represents invalid

"-" represents NIL

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:CHANNEL:SELECT might return 1, indicating the selected channel is valid.

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:LENGth? (Query Only)

Returns the value of the PDU length field from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:LENGth?

Arguments

None

Returns

<string> the value of the length field.

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:LENGTH? might return "100101" indicating value length field in binary.

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:LLID (Query Only)

Returns the LLID value (2 bits) under decoded packet information when the packet type is “OTHERS” for Low Energy in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:LLID?

Arguments

None

Returns

<String> Either 00,01,10,11

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:LLID might return 01, indicating the value of LLID is "01".

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:MD (Query Only)

Returns the MD value (1 bit) under decoded packet information when the packet type is “OTHERS” for Low Energy in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:MD?

Arguments

None

Returns

<Boolean> 0, 1

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:MD might return 1, indicating the value of MD is "1".

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:NESN (Query Only)

Returns the NESN value (1 bit) under decoded packet information when the packet type is “OTHERS” for Low Energy in Bluetooth Summary display.

Conditions

Measurement view: Bluetooth Summary display

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:NESN?

Arguments

None

Returns

<Boolean> 0, 1

Examples

`READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:NESN` might return 1, indicating the value of NESN is "1".

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:RX:ADDRess? (Query Only)

Returns the PDU Rx address from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:RX:ADDRess?`

Arguments

None

Returns

`<string>` the Rx address.

Examples

`READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:RX:ADDRESS?` might return 0.00000000 indicating Rx Address.

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:TX:ADDRess? (Query Only)

Returns the PDU Tx address from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:TX:ADDRess?`

Arguments

None

Returns

`<string>` the Tx address.

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:TX:ADDRESS? might return 0.00000000 indicating Tx Address.

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:TYPE? (Query Only)

Returns the PDU packet type from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PDU:HEADer:TYPE?

Arguments

None

Returns

<string> the PDU type.

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PDU:HEADER:TYPE? might return "0010" indicating the PDU type in binary.

READ:BLUEtooth:SUMMary:PACKet:BLE:PREAmble? (Query Only)

Returns the preamble of the BLE packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

READ:BLUEtooth:SUMMary:PACKet:BLE:PREAmble?

Arguments

None

Returns

<string> the preamble of the packet.

Examples

READ:BLUETOOTH:SUMMARY:PACKET:BLE:PREAMBLE? might return "01010101" indicating the preamble is 01010101 in binary.

READ:BLUEtooth:SUMMary:PACKet:BLE:TYPE? (Query Only)

Returns the packet type from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Read commands

Syntax

`READ:BLUEtooth:SUMMary:PACKet:BLE:TYPE?`

Arguments

None

Returns

`<string>` the BLE packet type.

Examples

`READ:BLUETOOTH:SUMMARY:PACKET:BLE:TYPE?` might return `"BLE_TEST"` indicating the BLE test signal is being analyzed.

READ:CCDF? (Query Only)

Returns the CCDF measurement results.

Conditions

Measurement views: CCDF

Group

Read commands

Syntax

`READ:CCDF?`

Arguments

None

Returns

`<avg_ampl>,<avg_ccdf>,<crest_factor>,<ampl_10>,<ampl_1>,`
`<ampl_p1>,<ampl_p01>,<ampl_p001>,<ampl_p0001>`

Where

`<avg_ampl>` is the average amplitude in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

`<avg_ccdf>` is the average CCDF in percent.

`<crest_factor>` is the crest factor in dB.

`<ampl_10>` is the amplitude at CCDF of 10% in dB.

<ampl_1> is the amplitude at CCDF of 1% in dB.

<ampl_p1> is the amplitude at CCDF of 0.1% in dB.

<ampl_p01> is the amplitude at CCDF of 0.01% in dB.

<ampl_p001> is the amplitude at CCDF of 0.001% in dB.

<ampl_p0001> is the amplitude at CCDF of 0.0001% in dB.

Examples

READ:CCDF? might return -33.35,35.8,9.75,3.88,7.07,8.50,9.25,9.72,9.74, indicating

(average amplitude) = -33.35 dBm,

(average CCDF) = 35.8%,

(crest factor) = 9.75 dB,

(amplitude at CCDF of 10%) = 3.88 dB,

(amplitude at CCDF of 1%) = 7.07 dB,

(amplitude at CCDF of 0.1%) = 8.50 dB,

(amplitude at CCDF of 0.01%) = 9.25 dB,

(amplitude at CCDF of 0.001%) = 9.72 dB, and

(amplitude at CCDF of 0.0001%) = 9.74 dB.

READ:CCDF:{FIRSt|SECond|THIRd}:X? (Query Only)

Returns the horizontal values of the specified trace in the CCDF measurement. The mnemonics FIRSt, SECond, and THIRd represent Trace 1, Trace 2, and Gaussian reference curve, respectively.

NOTE: This query is invalid when [SENSe]:CCDF:TIME:TYPE is set to CONTinuous or TOTal.

Conditions

Measurement views: CCDF

Group

Read commands

Syntax

READ:CCDF:{FIRSt|SECond|THIRd}:X?

Related Commands

READ:CCDF:{FIRSt|SECond|THIRd}[:Y]? (on page 1674)

Arguments

None

Returns

#<num_digit><num_byte><x(1)><x(2)>...<x(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)> is the horizontal value (dB) of the CCDF graph at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:CCDF:FIRST:X might return #41024xxxx... (1024-byte data) for the horizontal values of Trace 1.

READ:CCDF:{FIRSt|SECond|THIRd}:XY? (Query Only)

Returns the horizontal and vertical value pairs of the specified trace in the CCDF measurement.

The mnemonics FIRSt, SECond, and THIRd represent Trace 1, Trace 2, and Gaussian reference curve, respectively.

NOTE: This query is invalid when [SENSe]:CCDF:TIME:TYPE is set to CONTinuous or TOTal.

Conditions

Measurement views: CCDF

Group

Read commands

Syntax

READ:CCDF:{FIRSt|SECond|THIRd}:XY?

Arguments

None

Returns

#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)><y(n)> is the horizontal value (dB) and vertical value (%) pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:CCDF:FIRST:XY? might return #41024xxxx... (1024-byte data) for the horizontal and vertical value pairs of Trace 1.

READ:CCDF:{FIRSt|SECond|THIRd}[:Y]? (Query Only)

Returns the vertical values of the specified trace in the CCDF measurement.

The mnemonics FIRSt, SECond, and THIRd represent Trace 1, Trace 2, and Gaussian reference curve, respectively.

NOTE: This query is invalid when [SENSe]:CCDF:TIME:TYPE is set to CONTinuous or TOTal.

Conditions

Measurement views: CCDF

Group

Read commands

Syntax

`READ:CCDF:{FIRSt|SECond|THIRd}[:Y]?`

Arguments

None

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<y(n)>` is the vertical value (%) of the CCDF graph at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:CCDF:FIRST:Y` might return #41024xxxx... (1024-byte data) for the vertical values of Trace 1.

READ:CONSte[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in Hz. The frequency error is the difference between the measured carrier frequency of the signal and the user selected center frequency of the analyzer.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Read commands

Syntax

`READ:CONSte[:MEASview<y>]:FERRor?`

Related Commands

READ:EVM[:MEASview<y>]:FERRor? (Query only) (on page 1696)

Arguments

None

Returns

`<freq_error>::<NRf>` which is the frequency error in Hz.

Examples

READ:CONSte:MEASview2:FERRor? might return -10.7E+3, which is a frequency error of -10.7 kHz for measview 2 of constellation.

READ:CONSte[:MEASview<y>]:RESults? (Query only)

Returns the constellation measurement results of EVM RMS, peak, and location displayed on the bottom of the screen.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Read commands

Syntax

READ:CONSte[:MEASview<y>]:RESults?

Arguments

None

Returns

For modulation types 2|4|8|16FSK or C4FM:

FSK_deviation_Avg_Leftmost, FSK_deviation_Avg_Rightmost

Where

FSK_deviation_Avg_Leftmost is the average FSK deviation of the left-most

symbol in Hz.

FSK_deviation_Avg_Rightmost is the average FSK deviation of the

right-most symbol in Hz.

For all other valid modulation types:

<EVM_RMS>,<EVM_peak>,<location>

Where

<EVM_RMS>::<NRf> is the RMS EVM in percent (%).

<EVM_peak>::<NRf> is the peak EVM in percent (%).

<location>::<NRf> is the peak location in symbol number.

The time unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

READ:CONSTE:MEASview2:RESULTS? might return 2.841,3.227,68.000, indicating that the RMS EVM is 2.841% and the peak EVM is 3.227% at symbol #68 for measview 2 of constellation.

READ:CONSte[:MEASview<y>]:TRACe? (Query only)

Returns the constellation trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Read commands

Syntax

`READ:CONSte[:MEASview<y>]:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><I(1)><Q(1)><I(2)><Q(2)>...<I(n)><Q(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<I(n)>` and `<Q(n)>` are the normalized I- and Q-coordinate values at the n^{th} data point. 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:CONSTE:MEASview2:TRACE?` might return #43848xxxx... (3848-byte data) for the constellation trace data for measview 2 of constellation.

READ:DDEMod[:MEASview<y>]:STABle? (Query only)

Returns the symbol table data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Symbol table

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Symbol table).

Group

Read commands

Syntax

`READ:DDEMod[:MEASview<y>]:STABle?`

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the symbol table data for the point n, \4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:DDEMod:MEASview1:STABle? might return #3512xxxx... (512-byte data) for the symbol Table measurement view1.

READ:DIQVtime[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Demod I&Q versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Read commands

Syntax

READ:DIQVtime:[MEASview<y>]:FERRor?

Arguments

None

Returns

<freq_error>::<NRf> is the frequency error in Hz.

Examples

READ:DIQVtime:MEASview1:FERROR? might return -10.7E+3, indicating the frequency error is -10.7 kHz measurement view 1.

READ:DIQVtime[:MEASview<y>]:I? (Query only)

Returns the I versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Read commands

Syntax

`READ:DIQVtime[:MEASview<y>]:I?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the I level in volts at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:DIQVtime:MEASview1:I?` might return #3160xxxx... (160-byte data) for the I versus Time trace measurement view 1.

READ:DIQVtime[:MEASview<y>]:Q? (Query only)

Returns the Q versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Read commands

Syntax

`READ:DIQVtime[:MEASview<y>]:Q?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the Q level in volts at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:DIQVtime:MEASview1:Q?` might return #3160xxxx... (160-byte data) for the Q versus Time trace measurement view 1.

READ:DPX:DDENsity? (Query Only)

Returns the calculated density for the selected region in the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:DDENsity?`

Arguments

None

Returns

`<NR1>` value.

Examples

`READ:DPX:DDENSITY?` might return a DPX signal density value of 24.4802413393.

READ:DPX:DGRam:LINE:COUNt? (Query Only)

Returns the number of lines in the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:DGRam:LINE:COUNt?`

Arguments

None

Returns

`<NR1>` number of lines in the measurement.

Examples

`READ:DPX:DGRAM:LINE:COUNT?` might return `40` indicating that there were 40 lines in the measurement.

READ:DPX:DGRam:TIME[:SCALe]:OFFSet? (Query Only)

Returns the time scale offset in the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:DGRam:TIME[:SCALe]:OFFSet?`

Arguments

None

Returns

`<string>` The time offset in the DPXogram measurement in seconds.

Examples

`READ:DPX:DGRAM:TIME[:SCALE]:OFFSET?` might return `"0.000 s"` indicating that the time scale offset was 0.000 s.

READ:DPX:RESults:TRACe<x>? (Query Only)

Acquires a waveform and then returns waveform data of the specified trace <x> in the DPX spectrum measurement, where x is 1 to 6. The traces 1 to 4 are in the standard form. Trace 5 is the bitmap trace and its data is returned in a binary block. Trace 6 is the DPXogram trace on DPX spectrum plots. Trace 7 is the Ogram line in the DPXogram display.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:RESults:TRACe<x>?`

Arguments

`<NR1>`

Returns

For traces 1 to 4 or 6:

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude of the trace sample at the nth data point.

`<data(n)` is in the 4-byte little endian floating-point format specified in IEEE 488.2.

The format is a binary block of 32 bit floating point values. Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Examples

`READ:DPX:RESULTS:TRACE1?` might return #42004xxxx... (2004-byte of data) for the waveform data of trace one (1).

READ:DPX:TRACe:AVERage? (Query Only)

Acquires a waveform and then returns waveform data of the average trace in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:TRACe:AVERage?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the waveform data of the average trace for the point n in dBm, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:DPX:TRACE:AVERAGE?` might return #42004xxxx... (2004-byte data) for the waveform data of the average trace.

READ:DPX:TRACe:BITMap? (Query Only)

Acquires a waveform and then returns trace waveform data of the bitmap trace in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:TRACe:BITMap?`

Arguments

None

Returns

The format is a binary block of 32 bit floating point values. Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Examples

`READ:DPX:TRACE:BITMAP?` might return `#42004xxxx...` (2004-byte data) for the waveform data of the bitmap trace.

READ:DPX:TRACe:MATH? (Query Only)

Returns waveform data of the math trace in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:TRACe:MATH?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the waveform data of the math trace for the point n in dBm, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:DPX:TRACE:MATH?` might return `#42004xxxx...` (2004-byte data) for the waveform data of the math trace.

READ:DPX:TRACe:MAXimum? (Query Only)

Returns waveform data of the maximum trace in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

`READ:DPX:TRACe:MAXimum?`

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the waveform data of the maximum trace for the point n in dBm, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:DPX:TRACE:MAXIMUM? might return #42004xxxx... (2004-byte data) for the waveform data of the maximum trace.

READ:DPX:TRACe:MINimum? (Query Only)

Returns waveform data of the minimum trace in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Read commands

Syntax

READ:DPX:TRACe:MINimum?

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the waveform data of the minimum trace for the point n in dBm. 4-byte little endian floating-point format specified in IEEE 488.2. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:DPX:TRACE:MINIMUM? might return #42004xxxx... (2004-byte data) for the waveform data of the minimum trace.

READ:EDIagram[:MEASview<y>]:FDEViation? (Query only)

Returns the frequency deviation versus Time trace data with the X values.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Group

Read commands

Syntax

`READ:EDIagram[:MEASview<y>]:FDEViation?`

Returns

`#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)>` and `<X(n)>` is frequency deviation in Hz and time (symbols) pair at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:EDIagram:MEASview2:FDEVation?` might return #3160xxxx... (160-byte data) for the frequency deviation versus Time trace for measview2 of the Eye diagram.

READ:EDIagram[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the eye diagram measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Read commands

Syntax

`READ:EDIagram[:MEASview<y>]:FERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:EDIagram:MEASview2:FERRor?` might return -10.7E+3, indicating the frequency error is -10.7 kHz for measview2 of the Eye diagram.

READ:EDIagram[:MEASview<y>]:I? (Query only)

Returns the I versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Read commands

Syntax

`READ:EDIagram[:MEASview<y>]:I?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)><X(n)>` is the I level (normalized) and time (symbols) pair at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:EDIagram:MEASview2:I?` might return #3160xxxx... (160-byte data) for the I versus Time trace for measview2 of the Eye diagram.

READ:EDIagram[:MEASview<y>]:Q? (Query only)

Returns the Q versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Read commands

Syntax

`READ:EDIagram[:MEASview<y>]:Q?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)><X(n)>` is the Q level (normalized) and time (symbols) pair at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:EDIagram:MEASview2:Q?` might return #3160xxxx... (160-byte data) for the Q versus Time trace for measview2 of the Eye diagram.

READ:EMC:COUNt? (Query Only)

Returns the total numbers of spots detected in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:COUNt?`

Arguments

None

Returns

`<NR1>`

Examples

`READ:EMC:COUNT?` might return `12`, indicating that 12 spots are detected.

READ:EMC:EMISsion:RESults:STATus? (Query Only)

Returns the status of the emission results in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

READ:EMC:EMISsion:RESults:STATus?

Arguments

None

Returns

<String> either PASS or FAIL

Examples

READ:EMC:EMISSION:RESULTS:STATUS? might return FAIL, indicating that the status of emission results is failed.

READ:EMC:SPOT<x>:AMBIent:AMPLitude? (Query Only)

Returns the amplitude of the selected spot in ambient trace of EMC View.

<x> = the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

READ:EMC:SPOT<x>:AMBIent:AMPLitude?

Arguments

None

Returns

<NRf>

Examples

READ:EMC:SPOT1:AMBIent:AMPLitude? might return 52.612, indicating that amplitude of spot 1 in ambient trace is 52.61 dBuV.

READ:EMC:SPOT<x>:AMBIent:DELTa? (Query Only)

Returns the Delta value of the selected spot in ambient trace of EMC View.

<x> = the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

READ:EMC:SPOT<x>:AMBIent:DELTa?

Arguments

None

Returns

<NRf>

Examples

READ:EMC:SPOT<x>:AMBIent:DELTa? might return 3.3614, indicating that delta value of spot 2 in the ambient trace is 3.36 dBuV.

READ:EMC:SPOT<x>:AMBIent:PASS? (Query Only)

Returns the status of the selected spot in ambient trace in EMC view. The default status is THRE.

<x> = the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

READ:EMC:SPOT<x>:AMBIent:PASS?

Arguments

None

Returns

<String> Either OLIM, OMAR or THRE

Where

OLIM = Over Limit

OMAR = Over Margin

THRE = Threshold

Examples

READ:EMC:SPOT3:AMBIent:PASS? might return THRE, indicating that the spot 3 of ambient trace is failing by crossing Threshold.

READ:EMC:SPOT<x>:FREQuency? (Query Only)

Returns the frequency of the specified spot in EMC View.

<x> = <NR1> Indicates the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:FREQuency?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT2:FREQuency?` might return `366.12500000E+3`, indicating the frequency of spot 2 is 366.125 kHz.

READ:EMC:SPOT<x>:PASS? (Query Only)

Returns the overall status of the specified spot in EMC view. The default status is THRE.

<x> = <NR1> Indicates the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:PASS?`

Arguments

None

Returns

`<String>` Either OLIM, OMAR or THRE

Where

`OLIM` = Over Limit

`OMAR` = Over Margin

`THRE` = Threshold

Examples

`READ:EMC:SPOT1:PASS?` might return `OLIM`, indicating that spot 1 is failing by crossing the Over Limit.

READ:EMC:SPOT<x>:RANGe? (Query Only)

Returns the range of the selected spot in EMC View.

<x> = <NR1> Indicates the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:RANGe?`

Arguments

None

Returns

`<String>` from A to T

Examples

`READ:EMC:SPOT1:RANGe?` might return `"B"`, indicating that the range of spot 1 is "B".

READ:EMC:SPOT<x>:RECAll:AMPLitude? (Query Only)

Returns the amplitude of the specified spot in the recalled trace of EMC View.

<x> = Indicates the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:RECAll:AMPLitude?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT1:RECAll:AMPLitude?` might return `23.598`, indicating that amplitude of spot 1 in the recalled trace is 23.59 dBuV.

READ:EMC:SPOT<x>:RECAll:DELTa? (Query Only)

Returns the Delta value of the selected spot in recalled trace of EMC View.

<x> = the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:RECAll:DELTa?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT2:RECAll:DELTa?` might return `5.5878`, indicating that delta value of spot 2 in the recalled trace is 5.58 dBuV.

READ:EMC:SPOT<x>:RECAll:PASS? (Query Only)

Returns the status of the specified spot in recalled trace in EMC view. The default status is THRE.

<x> = the spot number

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:RECAll:PASS?`

Arguments

None

Returns

`<String>` Either OLIM, OMAR or THRE

Where

`OLIM` = Over Limit

`OMAR` = Over Margin

`THRE` = Threshold

Examples

`READ:EMC:SPOT<x>:RECAll:PASS?` might return `OMAR`, indicating that the spot 1 of recalled trace is failing by crossing Margin.

READ:EMC:SPOT<x>:SCAN<y>:AMPLitude? (Query Only)

Returns the amplitude of the specified spot with respect to specified scan detector in the results table.

<x> = the spot number

<y> = the scan detector number (either 1 or 2)

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:SCAN<y>:AMPLitude?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT1:SCAN1:AMPLitude?` might return `20.6209`, indicating that amplitude of spot 1 for scan detector 1 is 20.62 dBuV.

READ:EMC:SPOT<x>:SCAN<y>:DELTa? (Query Only)

Returns the Delta value of the specified spot with respect to the specified scan detector in the results table.

<x> = the spot number

<y> = the scan detector number (either 1 or 2)

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:SCAN<y>:DELTa?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT2:SCAN1:DELTa` might return `3.6209`, indicating that delta value of spot 2 for scan detector 1 is 3.62 dBuV.

READ:EMC:SPOT<x>:SCAN<y>:PASS? (Query Only)

Returns the status of the specified spot based on the specified scan detector in EMC view. The default status is THRE.

<x> = the spot number

<y> = the scan detector number (either 1 or 2)

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:SCAN<y>:PASS?`

Arguments

None

Returns

`<String>` Either OLIM, OMAR or THRE

Where

`OLIM` = Over Limit

`OMAR` = Over Margin

`THRE` = Threshold

Examples

`READ:EMC:SPOT2:SCAN1:PASS?` might return `THRE`, indicating that spot 2 of scan detector 1 is failing by crossing the threshold.

READ:EMC:SPOT<x>:SPOT<y>:AMPLitude? (Query Only)

Returns the amplitude of the specified spot with respect to specified spot detector in the results table.

<x> = the spot number

<y> = the spot detector number (either 1, 2, or 3)

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:SPOT<y>:AMPLitude?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT1:SPOT1:AMPLitude?` might return `18.365`, indicating that the amplitude of spot 1 for spot detector 1 is 18.36 dBuV.

READ:EMC:SPOT<x>:SPOT<y>:DELTa? (Query Only)

Returns the Delta value of the specified spot with respect to specified spot detector in the results table.

<x> = the spot number

<y> = the spot detector number (either 1, 2, or 3)

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:SPOT<y>:DELTa?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:EMC:SPOT2:SPOT1:DELTa?` might return `2.2578`, indicating that delta value of spot 2 for spot detection 1 is 2.25 dBuV.

READ:EMC:SPOT<x>:SPOT<y>:PASS? (Query Only)

Returns the status of the specified spot based on the specified spot detector in EMC view. The default status is THRE.

<x> = the spot number

<y> = the spot detector number (either 1, 2, or 3)

Conditions

Measurement view: EMC - EMI Display

Group

Read commands

Syntax

`READ:EMC:SPOT<x>:SPOT<y>:PASS?`

Arguments

None

Returns

`<String>` Either OLIM, OMAR or THRE

Where

`OLIM` = Over Limit

`OMAR` = Over Margin

THRE = Threshold

Examples

READ:EMC:SPOT1:SPOT2:PASS? might return OMAR, indicating that the spot 1 of spot detector 2 is failing by crossing the Margin.

READ:EVM[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the EVM versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod EVM versus Time).

Group

Read commands

Syntax

READ:EVM:[MEASVIEW<y>]:FERRor?

Arguments

None

Returns

<freq_error>::<NRf> is the frequency error in Hz.

Examples

READ:EVM:MEASVIEW2:FERROR? might return -10.7E+3, indicating the frequency error is -10.7 kHz for measview2 of EVM.

READ:EVM[:MEASview<y>]:PEAK? (Query only)

Returns the peak value in the EVM versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod EVM versus Time).

Group

Read commands

Syntax

READ:EVM[:MEASview<y>]:PEAK?

Related Commands

READ:EVM[:MEASview<y>]:PINDex? (on page 1697)

Arguments

None

Returns

<peak>::<NRf> is the peak EVM value in percent (%).

Examples

READ:EVM:MEASview2:PEAK? might return 1.32, indicating the peak EVM value is 1.32% for measview2 of EVM.

READ:EVM[:MEASview<y>]:PINDex? (Query only)

Returns the time at the EVM peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod EVM versus Time).

Group

Read commands

Syntax

READ:EVM[:MEASview<y>]:PINDex?

Related Commands

READ:EVM[:MEASview<y>]:PEAK? (on page 1696)

Arguments

None

Returns

<peak_time>::<NRf> is the time at the EVM peak in symbol number. The unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

READ:EVM:MEASview2:PINDEX? might return 68.000, indicating that the EVM peak is at symbol #68 for measview2 of EVM.

READ:EVM[:MEASview<y>]:RMS? (Query only)

Returns the RMS (Root-Mean-Square) value in the EVM versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod EVM versus Time).

Group

Read commands

Syntax

`READ:EVM[:MEASview<y>]:RMS?`

Arguments

None

Returns

`<rms>::<NRf>` is the RMS EVM value in percent (%).

Examples

`READ:EVM:MEASview2:RMS?` might return `0.582`, indicating the RMS EVM value is 0.582% for measview2 of EVM.

READ:EVM[:MEASview<y>]:TRACe? (Query only)

Returns the EVM versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod EVM versus Time).

Group

Read commands

Syntax

`READ:EVM[:MEASview<y>]:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the EVM versus Time trace data for the point n in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:EVM:MEASVIEW2:TRACE?` might return #42036xxxx... (2036-byte data) for the EVM versus Time measview2.

READ:FDVTime[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Frequency deviation versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Frequency deviation versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Frequency deviation versus Time).

Group

Read commands

Syntax

`READ:FDVTime:MEASview<y>:FERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:FDVTIME:MEASview2:FERROR?` might return `-10.7E+3`, indicating the frequency error is -10.7 kHz.

READ:FDVTime[:MEASview<y>]:TRACe? (Query only)

Returns the Frequency deviation versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Frequency deviation versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Frequency deviation versus Time).

Group

Read commands

Syntax

`READ:FDVTime:MEASview<y>:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the Frequency deviation versus Time trace data for the point n in Hz, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:FDVTime:MEASview2:TRACE?` might return #3160xxxx... (160-byte data) for the Frequency deviation versus Time measview 2.

READ:{FM|PM}:FERRor? (Query only)

Returns the frequency error in the Frequency modulation and Phase modulation measurements.

Conditions

Measurement views: Frequency and Phase modulation

Group

Read commands

Syntax

`READ:{FM|PM}:FERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:FM:FERRor?` might return `-10.7E+3`, indicating the frequency error is -10.7 kHz.

READ:FM:PHALf? (Query Only)

Returns the half peak-peak frequency deviation (Pk-Pk/2) in the FM measurement.

Conditions

Measurement views: Frequency deviation versus Time

Group

Read commands

Syntax

`READ:FM:PHALf?`

Arguments

None

Returns

<Pk-Pk/2>::<NRf> is the half peak-peak frequency deviation in Hz.

Examples

READ:FM:PHALF? might return 628.9E+3, indicating the half peak-peak frequency deviation is 628.9 kHz.

READ:FM:PNEGative? (Query Only)

Returns the negative peak frequency deviation (–Pk) in the FM measurement.

Conditions

Measurement views: FM

Group

Read commands

Syntax

READ:FM:PNEGative?

Arguments

None

Returns

<-Pk>::<NRf> is the negative peak frequency deviation in Hz.

Examples

READ:FM:PNEGATIVE? might return -495.6E+3, indicating the negative peak frequency deviation is –495.6 kHz.

READ:FM:PPOSitive? (Query Only)

Returns the positive peak frequency deviation (+Pk) in the FM measurement.

Conditions

Measurement views: FM

Group

Read commands

Syntax

READ:FM:PPOSitive?

Arguments

None

Returns

<+Pk>::<NRf> is the positive peak frequency deviation in Hz.

Examples

`READ:FM:PPOSITIVE?` might return `763.2E+3`, indicating the positive peak frequency deviation is 763.2 kHz.

READ:FM:PTPeak? (Query Only)

Returns the peak-peak frequency deviation (Pk-Pk) in the FM measurement.

Conditions

Measurement views: FM

Group

Read commands

Syntax

`READ:FM:PTPeak?`

Arguments

None

Returns

`<Pk-Pk>::<NRf>` is the peak-peak frequency deviation in Hz.

Examples

`READ:FM:PTPEAK?` might return `1.258E+6`, indicating the peak-peak frequency deviation is 1.258 MHz.

READ:FM:RESult? (Query Only)

Returns the FM measurement results.

Conditions

Measurement views: FM

Group

Read commands

Syntax

`READ:FM:RESult?`

Arguments

None

Returns

`<+Pk>,<-Pk>,<RMS>,<Pk-Pk>,<Pk-Pk/2>`

Where

`<+Pk>::<NRf>` is the positive peak frequency deviation in Hz.

`<-Pk>::<NRf>` is the negative peak frequency deviation in Hz.

`<RMS>::<NRf>` is the RMS frequency deviation in Hz.

`<Pk-Pk>::<NRf>` is the peak-peak frequency deviation in Hz.

<Pk-Pk/2>::<NRf> is the half peak-peak frequency deviation in Hz.

Examples

READ:FM:RESULT? might return 763.2E+3,-494.6E+3,271.2E+3,1.258E+6,628.9E+3.

READ:FM:RMS? (Query Only)

Returns the RMS frequency deviation in the FM measurement.

Conditions

Measurement views: FM

Group

Read commands

Syntax

READ:FM:RMS?

Arguments

None

Returns

<RMS>::<NRf> is the RMS frequency deviation in Hz.

Examples

READ:FM:RMS? might return 271.2E+3, indicating the RMS frequency deviation is 271.2 kHz.

READ:{FSETtling|PSETtling}:FTTime? (Query Only)

Returns the settling time from the trigger position in seconds. The settling time is measured from the trigger point (see :FETCh:FSETtling:TRIGger:TIME).

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

READ:{FSETtling|PSETtling}:FTTime?

Arguments

None

Returns

<value>::<NRf> is the settling time in seconds.

Examples

READ:FSETTLING:FTTIME? might return 44.8300E-6, indicating the settling time is 44.83 µs.

READ:{FSETtling|PSETtling}:MASK[:PASS]? (Query Only)

Returns whether the input signal passes the mask test.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:MASK[:PASS]?`

Arguments

None

Returns

0 is returned if the signal fails the mask test.

1 is returned if the signal passes the mask test.

Examples

`READ:FSETTLING:MASK:PASS?` might return `1`, indicating the signal passed (did not exceed the mask limits).

READ:{FSETtling|PSETtling}:SETTled:FREQuency? (Query Only)

Returns the frequency at which the signal is considered settled.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:SETTled:FREQuency?`

Arguments

None

Returns

`<value>::<NRf>` is the frequency at which the signal is settled.

Examples

`READ:FSETTLING:SETTLED:FREQUENCY?` might return `2.44838E+9`, indicating the input signal frequency at the point where the signal is considered settled is 2.44838 GHz.

READ:{FSETtling|PSETtling}:SETTled[:PASS]? (Query Only)

Returns whether the input signal is settled with the tolerance range.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:SETTled[:PASS]?`

Arguments

None

Returns

0 is returned if the signal is not settled within the tolerance range.

1 is returned if the signal is settled within the tolerance range.

Examples

`READ:FSETTLING:SETTLED:PASS?` might return `1`, indicating the signal is settled within the tolerance range.

READ:{FSETtling|PSETtling}:SETTled:TIME? (Query Only)

Returns the settled time in seconds. The settled time is measured from the measurement start point.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:SETTled:TIME?`

Arguments

None

Returns

`<value>::<NRf>` is the settled time in seconds.

Examples

`READ:FSETTLING:SETTLED:TIME?` might return `299.830000E-6`, indicating the settled time is 299.83 µs.

READ:{FSETtling|PSETtling}:SLMSd[:PASS]? (Query Only)

Returns whether the input signal is settled within the specified tolerance and the signal is settled longer than the Minimum Settled Duration `([SENSe]:{FSETtling|PSETtling}:SDURation:MINimum)`.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:SLMSd[:PASS]?`

Arguments

None

Returns

0 is returned if the signal is not settled within the tolerance range and minimum settled duration..

1 is returned if the signal is settled within the tolerance range and minimum settled duration.

Examples

`READ:FSETTLING:SLMSD:PASS?` might return `1`, indicating the signal is settled within the tolerance range and the minimum settled duration.

READ:{FSETtling|PSETtling}:STARt:TIME? (Query Only)

Returns the start time for the measurement in seconds. The start time is measured from the start of the analysis period.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:STARt:TIME?`

Arguments

None

Returns

`<value>::<NRf>` is the time in seconds when the measurement started.

Examples

`READ:FSETTLING:START:TIME?` might return `251.4300E-6`, indicating the measurement started 251.43 µs after the beginning of the analysis period.

READ:{FSETtling|PSETtling}:TIME? (Query Only)

Returns the settling time in seconds. The settling time is measured from the start time (see :FETCh:FSETtling:STARt:TIME (on page 1214)).

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:TIME?`

Arguments

None

Returns

`<value>::<NRf>` is the settling time in seconds.

Examples

`READ:FSETTLING:TIME?` might return `48.4000E-6`, indicating the settling time is 48.4 µs.

READ:{FSETtling|PSETtling}:TRACe<x>:X? (Query Only)

Returns the Frequency or Phase values of the specified trace.

The parameter `<x>` = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:TRACe<x>:X?`

Arguments

None

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<y(n)>` is the frequency (Hz) or phase (degrees) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:FSETTLING:TRACE1:X?` might return #574232xxxx... (74232-byte data) for the frequency values of Trace 1.

READ:{FSETtling|PSETtling}:TRACe<x>:XY? (Query Only)

Returns the time and frequency or phase value pairs of the specified trace.

The parameter `<x>` = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:TRACe<x>:XY?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)><y(n)>` is the time and frequency or phase value pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:FSETTLING:TRACE2:XY?` might return #574232xxxx... (74232-byte data) for the time and frequency pairs of the Trace 2.

READ:{FSETtling|PSETtling}:TRACe<x>[:Y]? (Query Only)

Returns the frequency or phase values of the specified trace.

The parameter `<x>` = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:TRACe<x>[:Y]?`

Arguments

None

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<y(n)>` is the frequency or phase value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:FSETTLING:TRACE1:Y?` might return #575148xxxx... (75148-byte data) for the frequency values of Trace 1.

READ:{FSETtling|PSETtling}:TRIGger:TIME? (Query Only)

Returns the time when the trigger occurred in seconds.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:TRIGger:TIME?`

Arguments

None

Returns

`<value>::<NRf>` is the time in seconds after the measurement start point when the trigger occurred.

Examples

`READ:FSETTLING:TRIGGER:TIME?` might return `2.255E-6`, indicating the time when the trigger occurred 255 µs after the start of the measurement.

READ:{FSETtling|PSETtling}:VALue? (Query Only)

Returns the settled value in Hz for Frequency Settling and in degrees for Phase Settling.

Conditions

Measurement views: Frequency and Phase Settling

Group

Read commands

Syntax

`READ:{FSETtling|PSETtling}:VALue?`

Arguments

None

Returns

`<value>::<NRf>` is the settling value in Hz for Frequency Settling and in degrees for Phase Settling.

Examples

`READ:FSETTLING:VALUE?` might return `2.44838155E+9`, indicating the settled frequency is 2.44838 GHz.

READ:FSETtling:ERRor? (Query Only)

Returns the settled error in Hz in Frequency Settling. Only for Frequency Settling Time measurement. In Frequency Settling:

When Target Reference is set to Auto, Settled Error = 0.

Conditions

Measurement views: Frequency Settling

Group

Read commands

Syntax

`READ:FSETtling:ERRor?`

Arguments

None

Returns

`<value>::<NRf>` returns the settled error in Hz.

When Target Reference is set to Auto, Settled Error = 0.

When Target Reference is set to Meas Freq:

Settled Error = Settled Frequency – (Measurement Frequency + Offset)

Examples

`READ:FSETTLING:ERRor?` might return 0, indicating the Target Reference is set to Auto.

READ:FVTime[:MEASview<y>]? (Query Only)

Returns the Frequency versus Time trace data.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

`READ:FVTime[:MEASview<y>]?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the frequency drift data for the point n in Hz, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:FVTIME:MEASview1? might return #3156xxxx... (156-byte data) for the Frequency versus Time trace.

READ:FVTime[:MEASview<y>]:MAXimum? (Query Only)

Returns the maximum value in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

READ:FVTime[:MEASview<y>]:MAXimum?

Related Commands

READ:FVTime[:MEASview<y>]:MAXLocation? (on page 1711)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<max>::<NRf> is the maximum frequency drift in Hz.

Examples

READ:FVTIME:MEASview1:MAXIMUM? might return 2.625E+6, indicating the maximum frequency drift is 2.625 MHz.

READ:FVTime[:MEASview<y>]:MAXLocation? (Query Only)

Returns the time at which the frequency drift is maximum.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

READ:FVTime[:MEASview<y>]:MAXLocation?

Related Commands

READ:FVTime[:MEASview<y>]:MAXimum? (on page 1711)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<max_time>::<NRf> is the time in seconds at which the frequency drift is maximum.

Examples

READ:FVTIME:MEASview1:MAXLOCATION? might return 25.03E-9, indicating the frequency drift is maximum at 25.03 ns.

READ:FVTime[:MEASview<y>]:MINimum? (Query Only)

Returns the minimum value in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

READ:FVTime[:MEASview<y>]:MINimum?

Related Commands

READ:FVTime[:MEASview<y>]:MINLocation? (on page 1712)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min>::<NRf> is the minimum frequency drift in Hz.

Examples

READ:FVTIME:MEASview1:MINIMUM? might return -6.618E+6, indicating the minimum frequency drift is -6.618 MHz.

READ:FVTime[:MEASview<y>]:MINLocation? (Query Only)

Returns the time at which the frequency drift is minimum.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

READ:FVTime[:MEASview<y>]:MINLocation?

Related Commands

READ:FVTime[:MEASview<y>]:MINimum? (on page 1712)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min_time>::<NRf> is the time in seconds at which the frequency drift is minimum.

Examples

READ:FVTIME:MEASview1:MINLOCATION? might return 450.7E-9, indicating the frequency drift is minimum at 450.7 ns.

READ:FVTime[:MEASview<y>]:OGRAm? (Query only)

Returns the ogram trace data. The line is selected using the TRACe:FVTime:MEASview<y>:OGRAm:SELect:LINE command.

Conditions

Applicable measurement view must be active.

Group

Read commands

Syntax

READ:FVTime[:MEASview<y>]:OGRAm?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the frequency at the n^{th} data point in Hz, represented as a 4-byte little-endian IEEE floating-point value.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:FVTime:MEASview1:OGRAm? might return #43204xxxx... (3204-byte data) for the ogram trace.

READ:FVTime[:MEASview<y>]:RESult? (Query Only)

Returns the Frequency versus Time measurement results.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

`READ:FVTime[:MEASview<y>]:RESult?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<max>,<max_time>,<min>,<min_time>

Where

`<max>::<NRf>` is the maximum frequency drift in Hz.

`<max_time>::<NRf>` is the time in seconds at which the frequency drift is maximum.

`<min>::<NRf>` is the minimum frequency drift in Hz.

`<min_time>::<NRf>` is the time in seconds at which the frequency drift is minimum.

Examples

`READ:FVTIME:MEASview1:RESULT?` might return `2.625E+6,25.03E-9,-6.618E+6,450.7E-9`, indicating the maximum frequency drift is 2.625 MHz at 25.03 ns and the minimum frequency drift is -6.618 MHz at 450.7 ns.

READ:FVTime[:MEASview<y>]:TRACe:BITMap? (Query Only)

Acquires a waveform and then returns trace waveform data of the bitmap trace in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Read commands

Syntax

`READ:FVTime[:MEASview<y>]:TRACe:BITMap?`

Arguments

None

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

The format is a binary block of 32 bit floating point values. Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Examples

`READ:FVTIME:TRACE:BITMAP?` might return #42004xxxx... (2004-byte data) for the waveform data of the bitmap trace.

READ:IQVTime[:MEASview<y>]:I? (Query Only)

Returns the I versus Time trace data.

Conditions

Measurement views: RF I & Q versus Time

Group

Read commands

Syntax

`READ:IQVTime[:MEASview<y>]:I?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the I level data for the point n in volts, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:IQVTIME:MEASview1:I?` might return `#3160xxxx...` (160-byte data) for the I versus Time trace.

READ:IQVTime[:MEASview<y>]:MAXimum? (Query Only)

Returns the maximum value in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Read commands

Syntax

`READ:IQVTime[:MEASview<y>]:MAXimum?`

Related Commands

READ:IQVTime[:MEASview<y>]:MAXLocation? (on page 1716)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<max>::<NRf>` is the maximum I or Q level in volts.

Examples

`READ:IQVTIME:MEASview1:MAXIMUM?` might return `1.214`, indicating the maximum I or Q level is 1.214 V.

READ:IQVTime[:MEASview<y>]:MAXLocation? (Query Only)

Returns the time at which the I or Q level is maximum.

Conditions

Measurement views: RF I & Q versus Time

Group

Read commands

Syntax

`READ:IQVTime[:MEASview<y>]:MAXLocation?`

Related Commands

READ:IQVTime[:MEASview<y>]:MAXimum? (on page 1715)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<max_time>::<NRf>` is the time in seconds at which the I or Q level is maximum.

Examples

READ:IQVTIME:MEASview1:MAXLOCATION? might return `175.3E-9`, indicating the I or Q level is maximum at 175.3 ns.

READ:IQVTime[:MEASview<y>]:MINimum? (Query Only)

Returns the minimum value in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Read commands

Syntax

`READ:IQVTime[:MEASview<y>]:MINimum?`

Related Commands

READ:IQVTime[:MEASview<y>]:MINLocation? (on page 1717)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min>::<NRf> is the minimum I or Q level in volts.

Examples

READ:IQVTIME:MEASview1:MINIMUM? might return -370.5E-3, indicating the minimum I or Q level is -370.5 mV.

READ:IQVTime[:MEASview<y>]:MINLocation? (Query Only)

Returns the time at which the I or Q level is minimum.

Conditions

Measurement views: RF I & Q versus Time

Group

Read commands

Syntax

READ:IQVTime[:MEASview<y>]:MINLocation?

Related Commands

READ:IQVTime[:MEASview<y>]:MINimum? (on page 1716)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min_time>::<NRf> is the time in seconds at which the I or Q level is minimum.

Examples

READ:IQVTIME:MEASview1:MINLOCATION? might return 450.7E-9, indicating the I or Q level is minimum at 450.7 ns.

READ:IQVTime[:MEASview<y>]:Q? (Query Only)

Returns the Q versus Time trace data.

Conditions

Measurement views: IQ versus Time

Group

Read commands

Syntax

READ:IQVTime[:MEASview<y>]:Q?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the Q level data for the point n in volts, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:IQVTIME:MEASview1:Q? might return #3160xxxx... (160-byte data) for the Q versus Time trace.

READ:IQVTime[:MEASview<y>]:RESult? (Query Only)

Returns the RF I & Q versus Time measurement results.

Conditions

Measurement views: RF I & Q versus Time

Group

Read commands

Syntax

READ:IQVTime[:MEASview<y>]:RESult?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<max>,<max_time>,<min>,<min_time>

Where

<max>::<NRf> is the maximum I or Q level in volts.

<max_time>::<NRf> is the time in seconds at which the I or Q level is

maximum.

<min>::<NRf> is the minimum I or Q level in volts.

<min_time>::<NRf> is the time in seconds at which the I or Q level is minimum.

Examples

READ:IQVTIME:MEASview1:RESULT? might return 1.214,175.3E-9,-370.5E-3,450.7E-9, indicating the maximum I or Q level is 1.214 V at 175.3 ns and the minimum I or Q level is -370.5 mV at 450.7 ns.

READ:LTE:ACLR:MHITs:COUNt? (Query Only)

Returns the number of rows in the results table of the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Read commands

Syntax

```
READ:LTE:ACLR:MHITs:COUNt?
```

Returns

<NR1>

Examples

READ:LTE:ACLR:MHITS:COUNT? might return 7, indicating there are seven rows in the results table.

READ:LTE:ACLR:MHITs<x>:BANDwidth? (Query Only)

Returns the bandwidth value of the channel (row) of the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> is the row number in the LTE ACLR display results table.

Group

Read commands

Syntax

```
READ:LTE:ACLR:MHITs<x>:BANDwidth?
```

Returns

<NR3>

Examples

READ:LTE:ACLR:MHITS1:BANDWIDTH? might return 4.5150000000E+6, which indicates a bandwidth for channel 1 (row 1) of 4.515 MHz.

READ:LTE:ACLR:MHITs<x>:CHANnel:NAME? (Query Only)

Returns the channel name of the specified index in the results table of the LTE ACLR display. The minimum index will be 1 and the maximum index will be the count of the channels in the results table.

Conditions

Measurement view: LTE ACLR

The parameter <x> is a positive integer and represents the row number in the LTE ACLR display results table.

Group

Read commands

Syntax

```
READ:LTE:ACLR:MHITs<x>:CHANnel:NAME?
```

Returns

<string>

Examples

`READ:LTE:ACLR:MHITS2:CHANNEL:NAME?` might return `"B"`, which is the name of channel 2 (row 2).

READ:LTE:ACLR:MHITs<x>:FREQuency:OFFSet? (Query Only)

Returns the frequency offset of the channel of the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> is a positive integer and represents the row number in the LTE ACLR display results table.

Group

Read commands

Syntax

`READ:LTE:ACLR:MHITs<x>:FREQuency:OFFSet?`

Returns

`<NR3>`

Examples

`READ:LTE:ACLR:MHITS1:FREQUENCY:OFFSET?` might return `5.0000000000E+6`, which indicates the frequency offset of channel 1 (row 1) is 5 MHz.

READ:LTE:ACLR:MHITs<x>:INTeg:LOWEr:ABSolute? (Query Only)

Returns the lower absolute value of the channel of the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> is the row number in the LTE ACLR display results table.

Group

Read commands

Syntax

`READ:LTE:ACLR:MHITs<x>:INTeg:LOWEr:ABSolute?`

Returns

`<NRf>`

Examples

`READ:LTE:ACLR:MHITs1:INTeg:LOWEr:ABSolute?` might return `-53.3921980303` which indicates lower absolute value of channel 1 (row 1) is -53.3921980303 dBm.

NOTE: The actual units depends on the choice made from the units tab of the Analysis control panel.

READ:LTE:ACLR:MHITs<x>:INTeg:LOWEr:RELative? (Query Only)

Returns the lower relative value of the channel of the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> is the row number in the LTE ACLR display results table.

Group

Read commands

Syntax

```
READ:LTE:ACLR:MHITs<x>:INTeg:LOWEr:RELative?
```

Returns

<NRf>

Examples

`READ:LTE:ACLR:MHITS1:INTEG:LOWER:RELATIVE?` might return `-53.3921980303`, which indicates lower relative value of channel 1 (row 1) is -53.3921980303 dB.

READ:LTE:ACLR:MHITs<x>:INTeg:UPPEr:ABSolute? (Query Only)

Returns the upper absolute value of the channel of the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> is a positive integer and represents the row number in the LTE ACLR display results table.

Group

Read commands

Syntax

```
READ:LTE:ACLR:MHITs<x>:INTeg:UPPEr:ABSolute?
```

Returns

<NRf>

Examples

`READ:LTE:ACLR:MHITS1:INTEG:UPPER:ABSOLUTE?` might return `-53.3921980303`, which indicates upper absolute value of channel 1 (row 1) is -53.3921980303 dBm.

NOTE: The actual units depends on the choice made from the units tab of the Analysis control panel.

READ:LTE:ACLR:REFerence:POWer? (Query Only)

Returns the reference power level in the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Read commands

Syntax

`READ:LTE:ACLR:REFerence:POWer?`

Returns

`<NRf>`

Examples

`READ:LTE:ACLR:REFERENCE:POWER?` might return `-16.92`, indicating that the reference power level is –16.92 dBm.

READ:LTE:ACLR:RESUlts:STATus? (Query Only)

Returns the pass or fail status of the LTE ACLR display measurement.

Conditions

Measurement view: LTE ACLR

Group

Read commands

Syntax

`READ:LTE:ACLR:RESUlts:STATus?`

Returns

0 means measurement status is FAIL.

1 means measurement status is PASS.

Examples

`READ:LTE:ACLR:RESULTS:STATUS?` might return `1`, indicating that the LTE ACLR measurement status is PASS.

READ:LTE:ACLR:SPECtrum:X? (Query Only)

Returns the frequency of the spectrum trace in the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Read commands

Syntax

`READ:LTE:ACLR:SPECtrum:X?`

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where,

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)>` is the frequency (Hz) at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:LTE:ACLR:SPECTRUM:X?` might return `#516020xxxx...` (16020-byte data) for the frequencies of the spectrum trace.

READ:LTE:ACLR:SPECtrum:XY? (Query Only)

Returns the frequency and amplitude pairs of the spectrum trace in the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Read commands

Syntax

`READ:LTE:ACLR:SPECtrum:XY?`

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where,

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)><y(n)>` is the frequency (Hz) and amplitude (dBm) pair at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:LTE:ACLR:SPECTRUM:XY?` might return `#516020xxxx...` (16020-byte data) for the frequency and amplitude pairs of the spectrum trace.

READ:LTE:ACLR:SPECtrum:Y? (Query Only)

Returns the amplitude of the spectrum trace in the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Read commands

Syntax

`READ:LTE:ACLR:SPECtrum:Y?`

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where,

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<y(n)>` is the frequency (Hz) at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:LTE:ACLR:SPECTRUM:Y?` might return `#516020xxxx...` (16020-byte data) for the amplitude of the spectrum trace.

READ:LTE:CHSPectrum:OBW? (Query Only)

Returns the Occupied Bandwidth (Hz) of the LTE Channel Spectrum measurement view.

Conditions

Measurement view: LTE Channel Spectrum

Group

Read commands

Syntax

`READ:LTE:CHSPectrum:OBW?`

Returns

`<NR3>`

Examples

`READ:LTE:CHSPECTRUM:OBW?` might return `1.0851851250E+6`, indicating the occupied Bandwidth is 1.09 MHz.

READ:LTE:CHSPectrum:POWer:CHANnel? (Query Only)

Returns the Channel Power value in LTE Channel Spectrum display. The result will be in dBm (by default) or in the units chosen from the Units tab of the Analysis Control panel.

Conditions

Measurement view: LTE Channel Spectrum

Group

Read commands

Syntax

`READ:LTE:CHSPectrum:POWer:CHANnel?`

Returns

`<NRf>`

Examples

`READ:LTE:CHSPECTRUM:POWER:CHANNEL?` might return `-14.9248560147`, indicating that the Channel Power is -14.92 dBm.

READ:LTE:CHSPectrum:SPECtrum? (Query Only)

Returns spectrum trace data of the LTE Channel Spectrum measurement.

Conditions

Measurement view: LTE Channel Spectrum

Group

Read commands

Syntax

`READ:LTE:CHSPectrum:SPECtrum?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude in dBm at the nth data point, 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`READ:LTE:CHSPECTRUM:SPECTRUM?` might return `#43204 xxxx...` (3204-byte data) for the spectrum trace data of the LTE Channel Spectrum measurement.

READ:LTE:CONSte:CELL:ID? (Query Only)

Queries the Cell ID value LTE Constellation display.

Conditions

Measurement view: LTE Constellation

Group

Read commands

Syntax

`READ:LTE:CONSte:CELL:ID?`

Returns

`<NR1>`

Examples

`READ:LTE:CONSTE:CELL:ID?` might return `112`, indicating CELLID measurement number is 112.

READ:LTE:CONSte:FREQuency:ERRor? (Query Only)

Queries Frequency Error value in Hz for the LTE Constellation display.

Conditions

Measurement view: LTE Constellation

Group

Read commands

Syntax

`READ:LTE:CONSte:FREQuency:ERRor?`

Returns

<NRf>

Examples

READ:LTE:CONSTE:FREQUENCY:ERROR? might return -71.9780578613, indicating frequency error value is -71.9780578613 Hz.

READ:LTE:CONSte:GROUp:ID? (Query Only)

Queries the Group ID value for the LTE Constellation display.

Conditions

Measurement view: LTE Constellation

Group

Read commands

Syntax

READ:LTE:CONSte:GROUp:ID?

Returns

<NR1>

Examples

READ:LTE:CONSTE:GROUP:ID? might return 160, indicating Group ID measurement number is 160.

READ:LTE:CONSte:SECTor:ID? (Query Only)

Queries the Sector ID value for the LTE Constellation display.

Conditions

Measurement view: LTE Constellation

Group

Read commands

Syntax

READ:LTE:CONSte:SECTor:ID?

Returns

<NRf>

Examples

READ:LTE:CONSTE:SECTOR:ID? might return 2, indicating the Sector ID value is 2.

READ:LTE:PVTime:OFFSlot:POWer? (Query Only)

Returns the TOff power measurement value in dBm/MHz for the LTE Power vs Time display.

Conditions

Measurement view: LTE Power vs Time

Group

Read commands

Syntax

`READ:LTE:PVTime:OFFSlot:POWer?`

Returns

`<NRf>`

Examples

`READ:LTE:PVTIME:OFFSLOT:POWER?` might return `-76.11514587403`, indicating the offslot power is -76.11514 dBm/MHz.

READ:LTE:PVTime:RESUlts:STATus

Returns the pass or fail status for the LTE Power vs Time measurement.

Conditions

Measurement view: LTE Power vs Time

Group

Read commands

Syntax

`READ:LTE:PVTime:RESUlts:STATus`

Returns

0: means measurement status is FAIL.

1: means measurement status is PASS.

Examples

`READ:LTE:PVTIME:RESULTS:STATUS` might return `1`, indicating the measurement status is PASS.

READ:LTE:PVTime:TRACe:X? (Query Only)

Returns the horizontal values (time in seconds) for the LTE Power vs. Time trace.

Conditions

Measurement view: LTE Power vs Time

Group

Read commands

Syntax

`READ:LTE:PVTime:TRACe:X?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where,

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:LTE:PVTIME:TRACE:X? might return #43204 (3204-byte data), which represents the time in seconds (horizontal values).

READ:LTE:PVTime:TRACe:XY? (Query Only)

Returns the horizontal value (time in seconds) and vertical value (power) for the LTE Power vs. Time trace.

Conditions

Measurement view: LTE Power vs Time

Group

Read commands

Syntax

READ:LTE:PVTime:TRACe:XY?

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where,

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:LTE:PVTIME:TRACE:XY? might return #43204 (3204-byte data), which represents the horizontal value (time in seconds) and vertical value (power) pair at the nth data point.

READ:LTE:PVTime:TRACe:Y? (Query Only)

Returns the vertical values (power) for the LTE Power vs. Time trace.

Conditions

Measurement view: LTE Power vs Time

Group

Read commands

Syntax

READ:LTE:PVTime:TRACe:Y?

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where,

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:LTE:PVTIME:TRACE:Y? might return #43204 (3204-byte data), which represents the vertical values (power).

READ:MCPower:ADJacent:CHANnels? (Query Only)

Returns the power of adjacent channels in order of increasing frequency.

Conditions

Measurement views: MCPR

Group

Read commands

Syntax

READ:MCPower:ADJacent:CHANnels?

Arguments

None

Returns

<acpr_lower(n)>,...<acpr_lower(2)>,<acpr_lower(1)>,
<acpr_upper(1)>,<acpr_upper(2)>,...<acpr_upper(n)>

Where

<acpr_lower(n)> is the ACPR for the lower channel #n in dB.

<acpr_upper(n)> is the ACPR for the upper channel #n in dB.

To add a pair of upper and lower adjacent channels, use the [SENSe]:MCPower:CHANnel:ADJacent:ADD command.

Examples

READ:MCPOWER:ADJACENT:CHANNELS? might return

-4.420,-4.847,-4.316,-4.225, indicating

(ACPR for the lower channel 2) = -4.420 dB,

(ACPR for the lower channel 1) = -4.847 dB,

(ACPR for the upper channel 1) = -4.316 dB, and

(ACPR for the upper channel 2) = -4.225 dB.

READ:MCPower:CHANnel:POWer? (Query Only)

Returns the reference power in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Read commands

Syntax

`READ:MCPower:CHANnel:POWer?`

Arguments

None

Returns

`<ref_power>:<NRf>` is the reference power in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

To select the power reference, use the `[SENSe]:MCPower:RCHannels` commands.

Examples

`READ:MCPOWER:CHANNEL:POWER?` might return `4.227`, indicating that the reference power is 4.227 dBm.

READ:MCPower:MAIN:CHANnels? (Query Only)

Returns the power of main channels in order of increasing frequency.

Conditions

Measurement views: MCPR

Group

Read commands

Syntax

`READ:MCPower:MAIN:CHANnels?`

Related Commands

[SENSe]:MCPower:CHANnel:MAIN:{BANDwidth|BWIDth} (on page 2233)

[SENSe]:MCPower:CHANnel:MAIN:COUNt (on page 2234)

[SENSe]:MCPower:CHANnel:MAIN:INACtive (on page 2234)

[SENSe]:MCPower:CHANnel:MAIN:SPACing (on page 2235)

Arguments

None

Returns

`<power_main(1)>,<power_main(2)>,...<power_main(n)>`

Where

`<power_main(n)>` is the power of main channel #n in dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` command.

To specify the main channels, use the `[SENSe]:MCPower:CHANnel:MAIN` commands.

Examples

`READ:MCPOWER:MAIN:CHANNELS?` might return

`-2.420,-2.847,-2.316,-2.225`, indicating

(power of the main channel 1) = -2.420 dBm,

(power of the main channel 2) = -2.847 dBm,

(power of the main channel 3) = -2.316 dBm, and

(power of the main channel 4) = -2.225 dBm.

READ:MCPower:SPECtrum? (Query Only)

Returns spectrum trace data of the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Read commands

Syntax

`READ:MCPower:SPECtrum?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the spectrum trace data in dBm for the point n, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:MCPOWER:SPECTRUM?` might return `#43204xxxx...` (3204-byte data) for the spectrum trace data of the MCPR measurement.

READ:MERRor[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Magnitude error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Read commands

Syntax

`READ:MERRor[:MEASview<y>]:FERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:MERRor:MEASview2:FERRor?` might return -10.7E+3, indicating the frequency error is -10.7 kHz.

READ:MERRor[:MEASview<y>]:PEAK? (Query only)

Returns the peak value in the Magnitude error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Read commands

Syntax

`READ:MERRor[:MEASview<y>]:PEAK?`

Related Commands

READ:MERRor[:MEASview<y>]:PINDex? (on page 1732)

Arguments

None

Returns

`<peak>::<NRf>` is the peak magnitude error value in percent (%).

Examples

`READ:MERRor:MEASview2:PEAK?` might return 1.57, indicating the peak magnitude error is 1.57%.

READ:MERRor[:MEASview<y>]:PINDex? (Query only)

Returns the time at the Magnitude error peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Read commands

Syntax

`READ:MERRor[:MEASview<y>]:PINDex?`

Related Commands

READ:MERRor[:MEASview<y>]:PEAK? (on page 1732)

Arguments

None

Returns

`<peak_time>::<NRf>` is the time at the Magnitude error peak in symbol number. The unit can be changed by the `[SENSe]:DDEMod:TIMe:UNITs` command.

Examples

`READ:MERRor:MEASview2:PINDex?` might return 68.000, indicating that the Magnitude error peak is at symbol #68.

READ:MERRor[:MEASview<y>]:RMS? (Query only)

Returns the RMS (Root-Mean-Square) value in the Magnitude error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time.

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Read commands

Syntax

`READ:MERRor[:MEASview<y>]:RMS?`

Arguments

None

Returns

`<rms>::<NRf>` is the RMS magnitude error value in percent (%).

Examples

`READ:MERRor:MEASview2:RMS?` might return 0.382, indicating the RMS MERRor value is 0.382%.

READ:MERRor[:MEASview<y>]:TRACe? (Query only)

Returns the Magnitude error versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Read commands

Syntax

`READ:MERRor[:MEASview<y>]:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the Magnitude error versus Time trace data for the point n in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:MERRor:MEASview2:TRACe?` might return #42036xxxx... (2036-byte data) for the Magnitude error versus Time measview 2.

READ:NOISe:TABLe:VALue? (Query Only)

Returns the noise table data. A total of 7 values per frequency (28 bytes per frequency) is returned. The number of frequencies returned depends on the settings.

Conditions

Measurement view: Noise display

Group

Read commands

Syntax

`READ:NOISe:TABLe:VALue?`

Returns

Returns an array of floats (size of 4 bytes each) defined as:

- First frequency gain, noise figure, noise factor, y factor, noise temperature,cpower hot, power cold
- Second frequency gain, noise figure, noise factor, y factor, noise temperature, power hot, power cold

Examples

`READ:NOISE:TABLE:VALUE?`

READ:OBWidth:BOBW:XDBBandwidth? (Query Only)

Returns the difference between the higher and lower frequency points corresponding to the value where it is X dB less from the value at the center frequency.

Set the measurement direction using the appropriate inward or outward command before issuing this command.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

`READ:OBWidth:BOBW:XDBBandwidth?`

Related Commands

READ:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth? (on page 1735)

READ:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth? (on page 1737)

Arguments

None

Returns

`<value> ::= <NRf>` the X dBm bandwidth in Hz.

Examples

`READ:OBWIDTH:BOBW:XDBBANDWIDTH?` might return `89.12000E+3`, indicating the difference between the higher and lower frequency points is 89.12 kHz.

READ:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth? (Query Only)

Returns the difference between the higher and lower frequency points corresponding to the value which it is the X dBm value measured inwards (coming from the ends to the center frequency).

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

READ:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth?

Related Commands

READ:OBWidth:BOBW:XDBBandwidth? (on page 1735)

READ:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency? (on page 1736)

Arguments

None

Returns

<value> ::= <NRf> the input X dBm value in Hz.

Examples

READ:OBWIDTH:BOBW:XDBMBANDWIDTH:IN:BANDWIDTH? might return 1.2518400000E+6, indicating that the bandwidth corresponding to the input XdBm vaue is 1.2518 MHz measured in the inward direction.

READ:OBWidth:BOBW:XDBMbandwidth:IN:LEFT:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the left of the center frequency measured in the inward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

READ:OBWidth:BOBW:XDBMbandwidth:IN:LEFT:FREQuency?

Related Commands

READ:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency? (on page 1736)

Arguments

None

Returns

<value> ::= <NRf> the left frequency in Hz.

Examples

READ:OBWIDTH:BOBW:XDBMBANDWIDTH:IN:LEFT:FREQUENCY? might return 2.401E+9, indicating that the frequency corresponding to the X dbm value to the left of the center frequency is 2.401 GHz.

READ:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the right of the center frequency measured in the inward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

```
READ:OBWidth:BOBW:XDBMbandwidth:IN:RIGHt:FREQuency?
```

Related Commands

READ:OBWidth:BOBW:XDBMbandwidth:IN:LEFT:FREQuency? (on page 1736)

Arguments

None

Returns

`<value> ::= <NRf>` the right frequency in Hz.

Examples

`READ:OBWIDTH:BOBW:XDBMBANDWIDTH:IN:RIGHT:FREQUENCY?` might return `2.445E+9` indicating that the frequency corresponding to the XdBm value to the right of the center the frequency is 2.445 GHz.

READ:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth? (Query Only)

Returns the difference between the higher and lower frequency points corresponding to the value which it is the X dBm value measured outwards (from the center frequency to the ends).

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

```
READ:OBWidth:BOBW:XDBMbandwidth:OUT:BANDwidth?
```

Related Commands

READ:OBWidth:BOBW:XDBBandwidth? (on page 1735)

READ:OBWidth:BOBW:XDBMbandwidth:IN:BANDwidth? (on page 1735)

Arguments

None

Returns

`<value> ::= <NRf>` the input X dBm value in Hz.

Examples

READ:OBWIDTH:BOBW:XDBMBANDWIDTH:OUT:BANDWIDTH? might return 1.2518400000E+6 indicating that the bandwidth corresponding to the output XdBm vaue is 1.2518 MHz measured in the outward direction.

READ:OBWidth:BOBW:XDBMbandwidth:OUT:LEFT:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the left of the center frequency measured in the outward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

READ:OBWidth:BOBW:XDBMbandwidth:OUT:LEFT:FREQuency?

Related Commands

READ:OBWidth:BOBW:XDBMbandwidth:OUT:RIGHt:FREQuency? (on page 1738)

Arguments

None

Returns

<value> ::= <NRf> the left frequency in Hz.

Examples

READ:OBWIDTH:BOBW:XDBMBANDWIDTH:OUT:LEFT:FREQUENCY? might return 2.401E+9 indicating that the frequency corresponding to the X dbm value to the left of the center frequency is 2.401 Hz.

READ:OBWidth:BOBW:XDBMbandwidth:OUT:RIGHt:FREQuency? (Query Only)

Returns the frequency corresponding to the X dBm value to the right of the center frequency measured in the outward direction.

Conditions

Measurement views: Bluetooth 20 dB Bandwith

Group

Read commands

Syntax

READ:OBWidth:BOBW:XDBMbandwidth:OUT:RIGHt:FREQuency?

Related Commands

READ:OBWidth:BOBW:XDBMbandwidth:OUT:LEFT:FREQuency? (on page 1738)

Arguments

None

Returns

<value> ::= <NRf> the Right frequency in Hz.

Examples

READ:OBWIDTH:BOBW:XDBMBANDWIDTH:OUT:RIGHT:FREQUENCY? might return 2.445E+9 indicating that the frequency corresponding to the XdBm value to the right of the center the frequency is 2.445 GHz.

READ:OBWidth:FREQuency:ERRor? (Query Only)

Returns the frequency error in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:FREQuency:ERRor?

Arguments

None

Returns

<freq_error>::<NRf> is the frequency error in Hz.

Examples

READ:OBWIDTH:FREQUENCY:ERROR? might return -10.7E+3, indicating the frequency error is -10.7 kHz.

READ:OBWidth:OBWidth:BANDwidth? (Query Only)

Returns the occupied bandwidth in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:OBWidth:BANDwidth? (on page 1739)

Arguments

None

Returns

<OBW>::<NRf> is the occupied bandwidth in Hz.

Examples

`READ:OBWIDTH:OBWIDTH:BANDWIDTH?` might return `4.0E+6`, indicating the occupied bandwidth is 4 MHz.

READ:OBWidth:OBWidth:LEFT:FREQuency? (Query Only)

Returns the left (lower) frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

`READ:OBWidth:OBWidth:LEFT:FREQuency?`

Related Commands

READ:OBWidth:OBWidth:RIGHt:FREQuency? (on page 1741)

Arguments

None

Returns

`<OBW_left_freq>::<NRf>` is the left frequency in Hz.

Examples

`READ:OBWIDTH:OBWIDTH:LEFT:FREQUENCY?`

READ:OBWidth:OBWidth:LEFT:LEVel? (Query Only)

Returns the level at the left frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:OBWidth:LEFT:LEVel?

Related Commands

READ:OBWidth:OBWidth:RIGHt:LEVel? (on page 1742)

Arguments

None

Returns

<OBW_left_level>::<NRf> is the level at the left frequency in dB.

Examples

READ:OBWIDTH:OBWIDTH:LEFT:LEVEL? might return -23.5, indicating the level at the left frequency is -23.5 dB.

READ:OBWidth:OBWidth:POWer? (Query Only)

Returns the reference power in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:OBWidth:POWer?

Arguments

None

Returns

<OBW_ref_power>::<NRf> is the reference power in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:OBWIDTH:OBWIDTH:POWER? might return -10.0, indicating the reference power is -10 dBm.

READ:OBWidth:OBWidth:RIGHt:FREQuency? (Query Only)

Returns the right (higher) frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:OBWidth:RIGHt:FREQuency?

Related Commands

READ:OBWidth:OBWidth:LEFT:FREQuency? (on page 1740)

Arguments

None

Returns

<OBW_right_freq>::<NRf> is the right frequency in Hz.

Examples

`READ:OBWIDTH:OBWIDTH:RIGHT:FREQUENCY?` might return `1.502E+9`, indicating the right frequency is 1.502 GHz.

READ:OBWidth:OBWidth:RIGHt:LEVel? (Query Only)

Returns the level at the right frequency of the occupied bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

`READ:OBWidth:OBWidth:RIGHt:LEVel?`

Related Commands

READ:OBWidth:OBWidth:LEFT:LEVel? (on page 1740)

Arguments

None

Returns

`<OBW_right_level>::<NRf>` is the level at the right frequency in dB.

Examples

`READ:OBWIDTH:OBWIDTH:RIGHT:LEVEL?` might return `-23.5`, indicating the level at the right frequency is -23.5 dB.

READ:OBWidth:SPECtrum? (Query Only)

Returns spectrum trace data of the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

`READ:OBWidth:SPECtrum?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the amplitude in dBm at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:OBWIDTH:SPECTRUM? might return #43204xxxx... (3204-byte data) for the spectrum trace data of the Occupied Bandwidth measurement.

READ:OBWidth:XDBBandwidth:BANDwidth? (Query Only)

Returns the x dB bandwidth in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:XDBBandwidth:BANDwidth?

Arguments

None

Returns

<xdBBW>::<NRf> is the x dB bandwidth in Hz.

Examples

READ:OBWIDTH:XDBBANDWIDTH:BANDWIDTH? might return 2.0E+6, indicating the x dB bandwidth is 2 MHz.

READ:OBWidth:XDBBandwidth:LEFT:FREQuency? (Query Only)

Returns the left (lower) frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:XDBBandwidth:LEFT:FREQuency?

Related Commands

READ:OBWidth:XDBBandwidth:RIGHt:FREQuency? (on page 1745)

Arguments

None

Returns

<xdBBW_left_freq>::<NRf> is the left frequency in Hz.

Examples

READ:OBWIDTH:XDBBANDWIDTH:LEFT:FREQUENCY? might return 1.498E+9, indicating the left frequency is 1.498 GHz.

READ:OBWidth:XDBBandwidth:LEFT:LEVel? (Query Only)

Returns the level at the left frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:XDBBandwidth:LEFT:LEVel?

Related Commands

READ:OBWidth:XDBBandwidth:RIGHt:LEVel? (on page 1745)

Arguments

None

Returns

<xdBBW_left_level>::<NRf> is the level at the left frequency in dB.

Examples

READ:OBWIDTH:XDBBANDWIDTH:LEFT:LEVEL? might return -23.5, indicating the level at the left frequency is -23.5 dB.

READ:OBWidth:XDBBandwidth:POWer? (Query Only)

Returns the reference power in the x dB bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:XDBBandwidth:POWer?

Arguments

None

Returns

<xdBBW_ref_power>::<NRf> is the reference power in dBm. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:OBWIDTH:XDBBANDWIDTH:POWER? might return -10.0, indicating the reference power is -10 dBm.

READ:OBWidth:XDBBandwidth:RIGHt:FREQuency? (Query Only)

Returns the right (higher) frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:XDBBandwidth:RIGHt:FREQuency?

Related Commands

READ:OBWidth:XDBBandwidth:LEFT:FREQuency? (on page 1743)

Arguments

None

Returns

<xdBBW_right_freq>::<NRf> is the right frequency in Hz.

Examples

READ:OBWIDTH:XDBBANDWIDTH:RIGHT:FREQUENCY? might return 1.502E+9, indicating the right frequency is 1.502 GHz.

READ:OBWidth:XDBBandwidth:RIGHt:LEVel? (Query Only)

Returns the level at the right frequency of the x dB bandwidth.

Conditions

Measurement views: Occupied Bandwidth

Group

Read commands

Syntax

READ:OBWidth:XDBBandwidth:RIGHt:LEVel?

Related Commands

READ:OBWidth:XDBBandwidth:LEFT:LEVel? (on page 1744)

Arguments

None

Returns

<xdBBW_right_level>::<NRf> is the level at the right frequency in dB.

Examples

READ:OBWIDTH:XDBBANDWIDTH:RIGHT:LEVEL? might return -23.5, indicating the level at the right frequency is -23.5 dB.

READ:OFDM:APOWer? (Query Only)

Returns the average power in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:APOWer?

Arguments

None

Returns

<apower>::<NRf> the average power in dB.

Examples

READ:OFDM:APOWER? might return -23.4584459235 indicating the average power is –23.46 dB.

READ:OFDM:APOWer:PEAK? (Query Only)

Returns the peak-to-average power in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:APOWer:PEAK?

Arguments

None

Returns

<apower_peak>::<NRf> is the peak-to-average power in dBm.

Examples

READ:OFDM:APOWER:PEAK? might return 10.4140096289, indicating that peak-to-average power is 10.41 dBm.

READ:OFDM:CONSte:MAGNitude? (Query Only)

Returns the constellation magnitude data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:CONSte:MAGNitude?

Related Commands

READ:OFDM:CONSte:PHASe? (on page 1747)

READ:OFDM:CONSte:TYPE? (on page 1748)

READ:OFDM:CONSte:VALue? (on page 1749)

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:OFDM:CONSTE:MAGNITUDE? might return #510400xxxx... (10400-byte data) for the measurement.

READ:OFDM:CONSte:PHASe? (Query Only)

Returns the constellation phase data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:CONSte:PHASe?

Related Commands

READ:OFDM:CONSte:MAGNitude? (on page 1747)

READ:OFDM:CONSte:TYPE? (on page 1748)

READ:OFDM:CONSte:VALue? (on page 1749)

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:OFDM:CONSTE:PHASE?` might return `#510400xxxx...` (10400-byte data) for the measurement.

READ:OFDM:CONSte:TYPE? (Query Only)

Returns the constellation context value of the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:CONSte:TYPE?`

Related Commands

READ:OFDM:CONSte:MAGNitude? (on page 1747)

READ:OFDM:CONSte:PHASe? (on page 1747)

READ:OFDM:CONSte:VALue? (on page 1749)

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in 16-bit little endian integers. The integers must be translated to the proper context as listed below.

Integer value	Type (context)
0	Pilot
1	Data
2	Unused or Null

Examples

READ:OFDM:CONSTE:TYPE? might return #41352 (1352-byte data) for the measurement. The actual data must be decoded to the context type using the table above.

READ:OFDM:CONSte:VALue? (Query Only)

Returns the constellation value of the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Syntax

READ:OFDM:CONSte:VALue?

Related Commands

READ:OFDM:CONSte:MAGNitude? (on page 1747)

READ:OFDM:CONSte:PHASe? (on page 1747)

READ:OFDM:CONSte:TYPE? (on page 1748)

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in 16-bit little endian integers.

Examples

READ:OFDM:CONSTE:VALUE? might return #41352, indicating 1352 bytes of data for the measurement.

READ:OFDM:CPE? (Query Only)

Returns the Common Pilot Error magnitude for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:CPE?`

Arguments

None

Returns

`<NRf>` the RMS magnitude error in percent.

Examples

`READ:OFDM:CPE?` might return `3.7868041505`, indicating that the CPE is 3.787%.

READ:OFDM:CRESponse:MAGNitude? (Query Only)

Returns the channel response magnitude data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:CRESponse:MAGNitude?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:OFDM:CRESPONSE:MAGNITUDE?` might return `#3804xxxx. . .` (804 byte data) for the measurement.

READ:OFDM:CRESponse:PHASe? (Query Only)

Returns the channel response phase data for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:CRESponse:PHASe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:OFDM:CRESPONSE:PHASE?` might return `#3804xxxx. . .` (804 byte data) for the measurement.

READ:OFDM:EVM:PEAK:DECibel:ALL? (Query Only)

Returns the peak EVM data for all subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:DECibel:ALL?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`READ:OFDM:EVM:PEAK:DECIBEL:ALL?` might return `-20.1872549032` indicating the data is –20.19 dB for the measurement.

READ:OFDM:EVM:PEAK:DECibel:DATA? (Query Only)

Returns the peak EVM data for the data subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:DECibel:DATA?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`READ:OFDM:EVM:PEAK:DECIBEL:DATA?` might return `-20.1872549032` indicating the data is –20.19 dB for the measurement.

READ:OFDM:EVM:PEAK:DECibel:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:DECibel:PILots?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`READ:OFDM:EVM:PEAK:DECIBEL:PILOTS?` might return `-20.2872549032` indicating the data is –20.29 dB for the measurement.

READ:OFDM:EVM:PEAK:PERCent:ALL? (Query Only)

Returns the peak EVM data for all subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:PERCent:ALL?`

Arguments

None

Returns

`<NRf>` data in percent.

Examples

`READ:OFDM:EVM:PEAK:PERCENT:ALL?` might return `19.3223863840`, indicating the data is 19.322% for the measurement.

READ:OFDM:EVM:PEAK:PERCent:DATA? (Query Only)

Returns the peak EVM data for the data subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:PERCent:DATA?`

Arguments

None

Returns

`<NRf>` data in percent.

Examples

`READ:OFDM:EVM:PEAK:PERCENT:DATA?` might return `19.3223863840` indicating the data is 19.322% for the measurement.

READ:OFDM:EVM:PEAK:PERCent:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:PERCent:PILots?`

Arguments

None

Returns

`<NRf>` data in percent.

Examples

`READ:OFDM:EVM:PEAK:PERCENT:PILOTS?` might return `10.8543863840`, indicating the data is 10.854% for the measurement.

READ:OFDM:EVM:PEAK:SCARrier:ALL? (Query Only)

Returns the peak EVM data for all subcarriers at the subcarrier level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:SCARrier:ALL?`

Arguments

None

Returns

`<NR1>`

Examples

`READ:OFDM:EVM:PEAK:SCARRIER:ALL?` might return `99.00000`, indicating the data is 99 for the measurement.

READ:OFDM:EVM:PEAK:SCARrier:DATA? (Query Only)

Returns the peak EVM data for the data subcarriers at the subcarrrier level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:SCARrier:DATA?`

Arguments

None

Returns

<NR1>

Examples

READ:OFDM:EVM:PEAK:SCARRIER:DATA? might return 99.00000, indicating the data is 99 for the measurement.

READ:OFDM:EVM:PEAK:SCARrier:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers at the subxcarrier level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:EVM:PEAK:SCARrier:PILots?

Arguments

None

Returns

<NR1>

Examples

READ:OFDM:EVM:PEAK:SCARRIER:PILOTS? might return 88.00000, indicating the data is 88 for the measurement.

READ:OFDM:EVM:PEAK:SYMBol:ALL? (Query Only)

Returns the peak EVM data for all subcarriers at the symbol level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:EVM:PEAK:SYMBol:ALL?

Arguments

None

Returns

<NR1>

Examples

`READ:OFDM:EVM:PEAK:SYMBOL:ALL?` might return `2.00000`, indicating the data is 2 for the measurement

READ:OFDM:EVM:PEAK:SYMBol:DATA? (Query Only)

Returns the peak EVM data for the data subcarriers at the symbol level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:SYMBol:DATA?`

Arguments

`<NR1>`

Returns

Examples

`READ:OFDM:EVM:PEAK:SYMBOL:DATA?` might return `2.00000`, indicating the data is 2 for the measurement

READ:OFDM:EVM:PEAK:SYMBol:PILots? (Query Only)

Returns the peak EVM data for the pilot subcarriers at the symbol level in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:PEAK:SYMBol:PILots?`

Arguments

`<NR1>`

Returns

Examples

`READ:OFDM:EVM:PEAK:SYMBOL:PILOTS?` might return `1.00000`, indicating the data is 1 for the measurement

READ:OFDM:EVM:RMS:DECibel:ALL? (Query Only)

Returns the RMS EVM data for all subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:RMS:DECibel:ALL?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`READ:OFDM:EVM:RMS:DECIBEL:ALL?` might return `-26.9012093267` indicating the data is −26.90 for the measurement.

READ:OFDM:EVM:RMS:DECibel:DATA? (Query Only)

Returns the RMS EVM data for the data subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:EVM:RMS:DECibel:DATA?`

Arguments

None

Returns

`<NRf>` data in dB.

Examples

`READ:OFDM:EVM:RMS:DECIBEL:DATA?` might return `-26.8477116269` indicating the data is −26.85 for the measurement.

READ:OFDM:EVM:RMS:DECibel:PILots? (Query Only)

Returns the RMS EVM data for the pilot subcarriers in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax
`READ:OFDM:EVM:RMS:DECibel:PILots?`

Arguments
None

Returns
`<NRf>` data in dB.

Examples
`READ:OFDM:EVM:RMS:DECIBEL:PILOTS?` might return `-33.0589143032` indicating the data is −33.06 dB.

READ:OFDM:EVM:RMS:PERCent:ALL? (Query Only)
Returns the peak RMS data for all subcarriers in the OFDM measurement as a percent.

Conditions
Measurement views: OFDM

Group
Read commands

Syntax
`READ:OFDM:EVM:RMS:PERCent:ALL?`

Arguments
None

Returns
`<NRf>` data in percent.

Examples
`READ:OFDM:EVM:RMS:PERCENT:ALL?` might return `225.0743627548`, indicating the data is 225.074% for the measurement.

READ:OFDM:EVM:RMS:PERCent:DATA? (Query Only)
Returns the peak RMS data for the data subcarriers in the OFDM measurement as a percent.

Conditions
Measurement views: OFDM

Group
Read commands

Syntax
`READ:OFDM:EVM:RMS:PERCent:DATA?`

Arguments
None

Returns

<NRf> data in percent.

Examples

READ:OFDM:EVM:RMS:PERCENT:DATA? might return 260.6973409653, indicating that the data is 260.697% for the measurement.

READ:OFDM:EVM:RMS:PERCent:PILots? (Query Only)

Returns the peak RMS data for the pilot subcarriers in the OFDM measurement as a percent.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:EVM:RMS:PERCent:PILots?

Arguments

None

Returns

<NRf> data in percent.

Examples

READ:OFDM:EVM:RMS:PERCENT:PILOTS? might return 210.8103863840, indicating the data is 210.810% for the measurement.

READ:OFDM:EVM:TRACe<x>? (Query Only)

Returns the EVM trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:EVM:TRACe<x>?

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:OFDM:EVM:TRACE2? might return #252xxxx. . . (52 byte data) for the Average versus Symbols measurement.

READ:OFDM:FERRor? (Query Only)

Returns the Frequency error reading for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:FERRor?

Arguments

None

Returns

<NRf> frequency error.

Examples

READ:OFDM:FERROR? might return 82.8617142098E+3, indicating the frequency error was 82.86 kHz.

READ:OFDM:FLATness:PASS? (Query Only)

Queries whether the average power level values of subcarriers across the signal bandwidth on the OFDM Spectral Flatness display remain within the limits defined for a particular standard.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Read commands

Syntax

READ:OFDM:FLATness:PASS?

Returns

Returns "1" in the case that all data remains within the defined limits, and "0" otherwise.

Examples

`READ:OFDM:FLAT:PASS?` might return `1`, which means that the average power level values of subcarriers across the signal bandwidth remain within the defined limits.

READ:OFDM:FLATness:RESult? (Query Only)

Returns the summary results of each segment of the OFDM Spectral Flatness display.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Read commands

Syntax

`READ:OFDM:FLATness:RESult?`

Returns

The data is returned as 12 comma delineated text values. The specific values are :

- minimum subcarrier within segment 1
- minimum subcarrier average energy deviation from the global average within segment 1
- deviation the of minimum subcarrier average from the allowed value in segment 1
- maximum subcarrier within segment 1
- maximum subcarrier average energy deviation from the global average within segment 1
- deviation of the maximum subcarrier average from the allowed value in segment 1
- minimum subcarrier within segment 2
- minimum subcarrier average energy deviation from the global average within segment 2
- deviation the of minimum subcarrier average from the allowed value in segment 2
- maximum subcarrier within segment 2
- maximum subcarrier average energy deviation from the global average within segment 2
- deviation of the maximum subcarrier average from the allowed value in segment 2

Examples

`READ:OFDM:FLAT:RES?` might return might return `-6.0000000000,-17.0626174659E-3,3.9829373825,12.0000000000,19.9792608`, which represents the summary results of each segment of the OFDM Spectral Flatness display.

READ:OFDM:FLATness:TRACe<x>? (Query Only)

Returns the OFDM Spectral Flatness trace data. When <x> is 1, the parameter is Matrix (symbol deviation per subcarrier). When<x> is 2, the parameter is Average Deviation vs Subcarrier.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Read commands

Syntax

`READ:OFDM:FLATness:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:OFDM:FLAT:TRACE2?` might return #510400.. (10400-byte data) which represents the data for the Average Deviation vs. Subcarrier trace.

READ:OFDM:GAIN:IMBalance? (Query Only)

Returns the gain imbalance for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:GAIN:IMBalance?`

Arguments

None

Returns

`<NRf>` gain imbalance in dB.

Examples

`READ:OFDM:GAIN:IMBALANCE?` might return `-57.746E-3` indicating that the gain imbalance is −0.057746 dB.

READ:OFDM:IQ:ORIGin:OFFSet? (Query Only)

Returns the IQ origin offset for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:IQ:ORIGin:OFFSet?`

Arguments

None

Returns

`<NRf>` gain imbalance in dB.

Examples

`READ:OFDM:IQ:ORIGIN:OFFSET?` might return `-53.47017`, indicating that the IQ origin offset is –53.47 dB.

READ:OFDM:MERRor:TRACe<x>? (Query Only)

Returns the magnitude error trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:MERRor:TRACe<x>?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:OFDM:MERROR:TRACE2` might return `#3108xxxx. . .` (108-byte data) for the average versus symbols trace measurement.

READ:OFDM:PACKet:DIRection? (Query Only)

Returns the direction of the packet in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:PACKet:DIRection?`

Arguments

None

Returns

One of the following values.

UP specifies that the packet is in the up direction.

DOWN specifies that the packet is in the down direction.

BOTH specifies that the packet is both directions.

Examples

`READ:OFDM:PACKET:DIRECTION?` might return `DOWN`, indicating that the packet was in the down direction.

READ:OFDM:PERRor:TRACe<x>? (Query Only)

Returns the phase error trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

`READ:OFDM:PERRor:TRACe<x>?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:OFDM:PERROR:TRACE2 might return #3100xxxx. . . (100-byte data) for the average versus symbols trace measurement.

READ:OFDM:POWer:TRACe<x>? (Query Only)

Returns the power trace data for the OFDM measurement.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbols.

When <x> is 3, the parameter is Average versus Subcarrier.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:POWer:TRACe<x>?

Arguments

None

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:OFDM:POWER:TRACE2 might return #296xxxx. . . (96-byte data) for the average versus symbols trace measurement.

READ:OFDM:QUADrature:OFFSet? (Query Only)

Returns the quadrature offset in the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax
`READ:OFDM:QUADrature:OFFSet?`

Arguments
None

Returns
`<NRf>` quadrature offset in degrees.

Examples
`READ:OFDM:QUADRATURE:OFFSET?` might return `-99.9`, indicating that the offset is −99°.

READ:OFDM:SCARriers? (Query Only)
Returns the number of subcarriers in the OFDM measurement.

Conditions
Measurement views: OFDM

Group
Read commands

Syntax
`READ:OFDM:SCARriers?`

Arguments
None

Returns
`<NR1>` number of subcarriers.

Examples
`READ:OFDM:SCARRIERS?` might return `200.0000`, indicating that there are 200 subcarriers in the measurement.

READ:OFDM:SCARriers:SPACing? (Query Only)
Returns the subcarrier spacing for the OFDM measurement.

Conditions
Measurement views: OFDM

Group
Read commands

Syntax
`READ:OFDM:SCARriers:SPACing?`

Arguments
None

Returns

<NRf> subcarrier spacing.

Examples

READ:OFDM:SCARRIERS:SPACING? might return 90.000E+3, indicating that the subcarrier spacing is 90.000 kHz.

READ:OFDM:STABle:VALUe? (Query Only)

Returns the number of bytes in the symbol table for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:STABle:VALUe?

Arguments

None

Returns

#<num_digit><num_byte>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

Examples

READ:OFDM:STABLE:VALUE? might return #43848, indicating that there are 3848 bytes in the symbol table.

READ:OFDM:SYMBol:CERRor? (Query Only)

Returns the symbol clock error for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:SYMBol:CERRor?

Arguments

None

Returns

<NRf> symbol clock error in ppm.

Examples

READ:OFDM:SYMBOL:CERROR? might return 422.7135479929, indicating that the symbol clock error was 422.714 ppm.

READ:OFDM:SYMBol:COUNt? (Query Only)

Returns the number of symbols for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Read commands

Syntax

READ:OFDM:SYMBol:COUNt?

Arguments

None

Returns

<NR1> number of symbols in the measurement.

Examples

READ:OFDM:SYMBOL:COUNT? might return 25.00000, indicating that there were 25 symbols for the measurement.

READ:P25:CONSte:FERRor? (Query Only)

Returns the frequency error in Hz. The frequency error is the difference between the measured carrier frequency of the signal and the user-selected center frequency of the analyzer.

When Frequency Error is in Auto mode, this query returns the frequency error value. When in Manual mode, it returns the frequency offset.

Conditions

Measurement view: P25 Constellation

Group

Read commands

Syntax

READ:P25:CONSte:FERRor?

Returns

<freq_error>::<NRf> is the frequency error in Hz.

Examples

READ:P25:CONSTE:FERROR? might return -10.7E+3, which is a frequency error of -10.7 kHz.

READ:P25:EDIagram:FDEViation? (Query Only)

Returns the Frequency Deviation vs Time trace data with the X values.

Conditions

Measurement view: P25 Eye Diagram

Group

Read commands

Syntax

`READ:P25:EDIagram:FDEViation?`

Returns

`#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)>` and `<X(n)>` are the frequency deviation in Hz and time (symbols) coordinate pair at the nth data point. 4-byte little endian floating point format specified in IEEE 488.2.

Examples

`READ:P25:EDIAGRAM:FDEVIATION?` might return `#3160xxxx...` (160-byte data) for the Frequency Deviation vs Time trace.

READ:P25:EDIagram:FERRor? (Query Only)

Returns the frequency error in Hz. The frequency error is the difference between the measured carrier frequency of the signal and the user-selected center frequency of the analyzer.

Conditions

Measurement view: P25 Eye Diagram

Group

Read commands

Syntax

`READ:P25:EDIagram:FERRor?`

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:P25:EDIAGRAM:FERROR?` might return `-10.7E+3`, which is a frequency error of -10.7 kHz.

READ:P25:PVTime:BURSt:POWer? (Query Only)

Returns the average power of the burst packet, in dBm, for the P25 Power vs. Time trace.

Conditions

Measurement view: P25 Power vs. Time

Group

Read commands

Syntax

```
READ:P25:PVTime:BURSt:POWer?
```

Returns

Floating point number that represents the average power of the burst packet, in dBm.

Examples

`READ:P25:PVTIME:BURST:POWER?` might return `-1.99`, which represents the value of the average power of the burst packet of -1.99 dBm.

READ:P25:PVTime:FALL:TIMe? (Query Only)

Queries the value of the width of the falling edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Read commands

Syntax

```
READ:P25:PVTime:FALL:TIMe?
```

Related Commands

READ:P25:PVTime:FTIMe? (on page 1770)

Returns

Floating point number which represents the value of the width of the falling edge of the burst, in seconds.

Examples

`READ:P25:PVTIME:FALL:TIME?` might return `7e-6`, which indicates the width of the falling edge is 7 µs.

READ:P25:PVTime:FTIMe? (Query Only)

Queries the value of the width of the falling edge, in seconds.

Conditions

Measurement view: P25 Power vs. Time

Group

Read commands

Syntax

```
READ:P25:PVTime:FTIMe?
```

Related Commands

READ:P25:PVTime:FALL:TIMe? (on page 1770)

Returns

Floating point number which represents the value of the width of the falling edge of the burst, in seconds.

Examples

`READ:P25:PVTIME:FTIME?` might return `7e-6`, which indicates the width of the falling edge is 7 µs.

READ:P25:PVTime:TRACe:X? (Query Only)

Returns the horizontal values (time in seconds) for the P25 Power vs. Time trace.

Conditions

Measurement view: P25 Power vs. Time

Group

Read commands

Syntax

`READ:P25:PVTime:TRACe:X?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:P25:PVTIME:TRACE:X?` might return `#43204` (3204-byte data), which represents the value of the time in seconds (horizontal values) for the P25 Power vs. Time trace.

READ:P25:PVTime:TRACe:XY? (Query Only)

Returns the horizontal value (time in seconds) and vertical value (power) for the P25 Power vs. Time trace <x(n)><y(n)> is the horizontal value and vertical value pair at the nth data point.

Conditions

Measurement view: P25 Power vs. Time

Group

Read commands

Syntax

`READ:P25:PVTime:TRACe:XY?`

Related Commands

READ:P25:PVTime:TRACe:X? (on page 1771)

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:P25:PVTIME:TRACE:XY?` might return #43204 (3204-byte data), which represents the horizontal value (time in seconds) and vertical value (power) pair at the nth data point.

READ:P25:SUMMary:LIMIt:SRA (Query Only)

Returns Limit of Symbol Rate Accuracy measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:LIMIt:SRA`

Arguments

None

Returns

might return PASS, FAIL or NA.

Examples

`READ:P25:SUMMARY:LIMIT:SRA`

READ:P25:SUMMary:MODUlation:MEASurement:FIDelity? (Query Only)

Returns the Modulation Fidelity measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

READ:P25:SUMMary:MODUlation:MEASurement:FIDelity?

Arguments

None

Returns

Modulation Fidelity measurement result

Examples

READ:P25:SUMMARY:MODULATION:MEASUREMENT:FIDELITY?

READ:P25:SUMMary:MODUlation:MEASurement:FIDelity:STATus (Query Only)

Returns the Modulation Fidelity measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

READ:P25:SUMMary:MODUlation:MEASurement:FIDelity:STATus?

Arguments

None

Examples

READ:P25:SUMMARY:MODULATION:MEASUREMENT:FIDELITY:STATUS? might return PASS, FAIL, or NA.

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency: ACCUracy (No Query Form)

Returns the Frequency Accuracy measurement's result.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy

Arguments

None

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ACCURACY`

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy? (Query Only)

Returns the Operational Frequency Accuracy measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy?`

Arguments

None

Returns

Frequency Accuracy measurement result

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ACCURACY?`

READ:P25:SUMMary:MODUlation:MEASurement: FREQuency:ACCUracy:STATus (Query Only)

Returns the status of Frequency Accuracy measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ACCUracy:STATus?`

Arguments

None

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ACCURACY:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak

Returns the Frequency Deviation and negative peak measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak`

Arguments

`<integer,integer>`

Returns

Frequency Deviation, negative peak, result

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:NEGPEAK <2,6>` indicates the coordinate value of the Frequency Deviation negative peak.

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak:STATus

Returns the Status of Frequency Deviation, negative peak status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:NEGPeak:STATus?`

Arguments

`<Integer,Integer>`

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:NEGPEAK:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak

Returns the Frequency Deviation, positive peak, measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak`

Arguments

`<integer,integer>`

Returns

Frequency Deviation, positive peak, result

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:POSPEAK <-2,-6>` indicates the coordinate value of the Frequency Deviation positive peak.

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak:STATus

Returns the status of Frequency Deviation, positive peak status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:DEVIation:POSPeak:STATus?`

Arguments

None

Examples

`READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:DEVIATION:POSPEAK:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ERRor

Returns the Frequency Error measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ERRor?
```

Arguments

None

Returns

Frequency Error measurement result

Examples

```
READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ERROR?
```

READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ERRor (Query Only)

Returns the Frequency Error measurement's result.

Conditions

Measurement views: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:MODUlation:MEASurement:FREQuency:ERRor
```

Arguments

None

Examples

```
READ:P25:SUMMARY:MODULATION:MEASUREMENT:FREQUENCY:ERROR
```

READ:P25:SUMMary:MODUlation:MEASurement:SRA

Returns the Symbol Rate Accuracy measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:MODUlation:MEASurement:SRA
```

Arguments

None

Returns

Symbol Rate Accuracy measurement result

Examples

```
READ:P25:SUMMARY:MODULATION:MEASUREMENT:SRA?
```

READ:P25:SUMMary:MODUlation:MEASurement:SRA:STATus (Query Only)

Returns Status of Symbol Rate Accuracy measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:MODUlation:MEASurement:SRA:STATus
```

Arguments

None

Returns

Might return PASS, FAIL or NA.

Examples

```
READ:P25:SUMMARY:MODULATION:MEASUREMENT:SRA:STATUS
```

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF (Query Only)

Returns HCPM Pmax-off measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF
```

Arguments

None

Examples

```
READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXOFF
```

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF:STATus? (Query Only)

Returns HCPM Pmax-off measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF:STATus?
```

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXOFF:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF? (Query Only)

This command returns the HCPM Pmax-off measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXOFF?
```

Returns

HCPM Pmax-off measurement results

Examples

```
READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXOFF?
```

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON (Query Only)

Returns HCPM Pmax-on measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXON`

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON:STATus (Query Only)

Returns Status of HCPM Pmax-on measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON:STATus`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXON:STATUS` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON? (Query Only)

This command returns the HCPM Pmax-on measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXON?
```

Returns

HCPM Pmax-on measurement results

Examples

```
READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXON?
```

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs (Query Only)

Returns HCPM Pss-max measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs
```

Arguments

None

Examples

```
READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXSS
```

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs:STATus (Query Only)

Returns HCPM Pss-max measurement status.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs:STATus?
```

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXSS:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs? (Query Only)

Returns the HCPM Pss-max measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:MAXSs?`

Returns

HCPM Pss-on measurement results

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MAXSS?`

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum (Query Only)

Returns HCPM Pss-min measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MINIMUM`

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum:STATus? (Query Only)

Returns Status of HCPM Pss-min measurement results based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum:STATus?`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MINIMUM:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum? (Query Only)

Returns the HCPM Pss-min measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:MINImum?`

Returns

HCPM Pss-min measurement results

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:MINIMUM?`

READ:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot (Query Only)

Returns HCPM Offslot measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot
```

Arguments

None

Examples

```
READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:OFFSLOT
```

READ:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot:STATus? (Query Only)

Returns Status of HCPM Offslot measurement based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:OFFSlot:STATus?
```

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:OFFSLOT:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:HI (Query Only)

Returns P_ACP_HI value which is displayed on P25 Summary display.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:HI?
```

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:HI?` might return `-37.963`, indicating P_ACP_HI value is -37.96 dBm.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:LOW (Query Only)

Returns P_ACP_LOW value which is displayed on P25 Summary display.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:LOW?`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:LOW?` might return `-40.125`, indicating P_ACP_LOW value is –40.13 dBm.

READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN (Query Only)

Returns Min Pk ACPR value which is displayed on P25 Summary Display.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN?`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:MIN?` might return `47.96`, indicating Min Pk ACPR value is 47.96 dBm

READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN:STATus(Query Only)

Returns Status of Min Pk ACPR value based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:HCPM:PEAK:ACPR:MIN:STATus`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:HCPM:PEAK:ACPR:MIN:STATUS` might return PASS, FAIL or NA.

READ:P25:SUMMary:POWEr:MEASurement:RF:STATus (Query Only)

Returns status of RF measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:POWEr:MEASurement:RF:STATus?`

Arguments

None

Examples

`READ:P25:SUMMARY:POWER:MEASUREMENT:RF:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:POWEr:MEASurement:RF (Query Only)

Returns RF measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:POWEr:MEASurement:RF
```

Arguments

None

Examples

```

```

READ:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:ACQ:COUNT? (Query Only)

Returns the HCPM Time alignment's t_error_1 acquisition count over which the t_error_1 averaging is done.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:ACQ:COUNT?
```

Returns

HCPM Time alignment's t_error_1 acquisition count over which the t_error_1 averaging is done.

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TERROR:ONE:ACQ:COUNT?
```

READ:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:STATus (Query Only)

Returns status of HCPM Time alignment's t_error_1 measurement results based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:HCPM:TIME:ALIGNment:TERRor:ONE:STATus?

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:HCPM:TIME:ALIGNMENT:TOBSYNC:ACQ:COUNT?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:BI:STATus (Query Only)

Returns status of Average Transmitter Power Encoder Attack Time measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:BI:STATus?
```

Arguments

None

Examples

`READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER:BI:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ACQ:COUNT:BI?(Query Only)

Returns the Average Transmitter Power Attack time busy/idle acquisition count over which the Phase 1 Attack time averaging is done.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ACQ:COUNT:BI?
```

Returns

Average Transmitter Power Attack, busy/idle, measurement results.

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ACQ:COUNT:BI?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:STATus (Query Only)

Returns Status of Average Transmitter Encoder Attack Time measurement results based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

`READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder:STATus?`

Arguments

None

Examples

`READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder? (Query Only)

Returns the Average Transmitter Encoder Attack Time measurement results

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:ENCOder?`

Returns

Average Transmitter Encoder Attack Time measurement results.

Examples

`READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:ENCODER?`

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr (Query Only)

Returns Average Transmitter Power Attack Time measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr?
```

Arguments

None

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI (Query Only)

Returns Average Transmitter Power Attack Time, busy/idle measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:ATTAck:TIME:POWEr:BI?
```

Arguments

Returns

Average Transmitter Power Attack Time measurement results.

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:ATTACK:TIME:POWER?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy (Query Only)

Returns Throughput delay measurement results.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy?
```

Arguments

None

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT (Query Only)

Returns Throughput delay acquisition counts.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT?
```

Arguments

None

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY:ACQ:COUNT?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT? (Query Only)

Returns the Throughput delay acquisition counts over which the Throughput delay averaging is done.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:ACQ:COUNT?
```

Returns

Throughput delay acquisition counts

Examples

```
READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY:ACQ:COUNT?
```

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:STATus (Query Only)

Returns Status of Throughput delay measurement results based on the limit.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Read commands

Syntax

```
READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy:STATus?
```

Arguments

None

Examples

`READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY:STATUS?` might return `PASS`, `FAIL`, or `NA`.

READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy? (Query Only)

Returns the Throughput delay measurement results.

Conditions

Measurement view: P25 Summary

Group

Read commands

Syntax

`READ:P25:SUMMary:TRIGger:MEASurement:PHASe1:THRUput:DELAy?`

Returns

Throughput delay measurement results.

Examples

`READ:P25:SUMMARY:TRIGGER:MEASUREMENT:PHASE1:THRUPUT:DELAY?`

READ:PERRor[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Read commands

Syntax

`READ:PERRor[:MEASview<y>]:FERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:PERRor:MEASview2:FERRor?` might return -10.7E+3, indicating the frequency error is -10.7 kHz for measurement view 2.

READ:PERRor[:MEASview<y>]:PEAK? (Query only)

Returns the peak value in the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Read commands

Syntax

`READ:PERRor[:MEASview<y>]:PEAK?`

Related Commands

READ:PERRor[:MEASview<y>]:PINDex? (on page 1800)

Arguments

None

Returns

`<peak>::<NRf>` is the peak phase error in percent (%).

Examples

`READ:PERRor:MEASview2:PEAK?` might return 1.57, indicating the peak phase error value is 1.57% for measurement view 2.

READ:PERRor[:MEASview<y>]:PINDex? (Query only)

Returns the time at the phase error peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Read commands

Syntax

`READ:PERRor[:MEASview<y>]:PINDex?`

Related Commands

READ:PERRor[:MEASview<y>]:PEAK? (on page 1800)

Arguments

None

Returns

<peak_time>::<NRf> is the time at the phase error peak in symbol number. The unit can be changed by [SENSe]:DDEMod:TIMe:UNITs command.

Examples

READ:PERRor:MEASview2:PINDex? might return 68.000, indicating that the phase error peak is at symbol #68 for measurement view 2.

READ:PERRor[:MEASview<y>]:RMS (Query only)

Returns the RMS (Root-Mean-Square) value in the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Read commands

Syntax

READ:PERRor[:MEASview<y>]:RMS?

Arguments

None

Returns

<rms>::<NRf> is the RMS phase error in percent (%).

Examples

READ:PERRor:MEASview2:RMS? might return 0.382, indicating the RMS PERRor value is 0.382% for measurement view 2.

READ:PERRor[:MEASview<y>]:TRACe? (Query only)

Returns the Phase error versus Time trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Read commands

Syntax

`READ:PERRor[:MEASview<y>]:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the phase error versus Time trace data for the point n in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:PERRor:MEASview2:TRACe?` might return #42036xxxx... (2036-byte data) for the Phase error versus Time measview 2.

READ:PHVTime[:MEASview<y>]? (Query Only)

Returns the Phase versus Time trace data.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

`READ:PHVTime[:MEASview<y>]?`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the phase in degrees at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:PHVTIME:MEASview1?` might return `#3160xxxx...` (160-byte data) for the Phase versus Time trace.

READ:PHVTime[:MEASview<y>]:MAXimum? (Query Only)

Returns the maximum value in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

`READ:PHVTime[:MEASview<y>]:MAXimum?`

Related Commands

READ:PHVTime[:MEASview<y>]:MAXLocation? (on page 1803)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<max>::<NRf>` is the maximum phase in degrees.

Examples

`READ:PHVTIME:MEASview1:MAXIMUM?` might return `153.8`, indicating the maximum phase is 153.8 °.

READ:PHVTime[:MEASview<y>]:MAXLocation? (Query Only)

Returns the time at which the phase is maximum.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

`READ:PHVTime[:MEASview<y>]:MAXLocation?`

Related Commands

READ:PHVTime[:MEASview<y>]:MAXimum? (on page 1803)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<max_time>::<NRf>` is the time in seconds at which the phase is maximum.

Examples

`READ:PHVTIME:MEASview1:MAXLOCATION?` might return `175.3E-9`, indicating the I or Q level is maximum at 175.3 ns.

READ:PHVTime[:MEASview<y>]:MINimum? (Query Only)

Returns the minimum value in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

`READ:PHVTime[:MEASview<y>]:MINimum?`

Related Commands

READ:PHVTime[:MEASview<y>]:MINLocation? (on page 1804)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<min>::<NRf>` is the minimum phase in degrees.

Examples

`READ:PHVTIME:MEASview1:MINIMUM?` might return `-176.3`, indicating the minimum phase is −176.3°.

READ:PHVTime[:MEASview<y>]:MINLocation? (Query Only)

Returns the time at which the phase is minimum.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

`READ:PHVTime[:MEASview<y>]:MINLocation?`

Related Commands

READ:PHVTime[:MEASview<y>]:MINimum? (on page 1804)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<min_time>::<NRf> is the time in seconds at which the phase is minimum.

Examples

READ:PHVTIME:MEASview1:MINLOCATION? might return 450.7E-9, indicating the phase is minimum at 450.7 ns.

READ:PHVTime[:MEASview<y>]:OGRAm? (Query Only)

Returns the ogram trace data. The line is selected using the TRACe:PHVTime:MEASview<y>:OGRAm:SELect:LINE command.

Conditions

Applicable measurement view must be active.

Group

Read commands

Syntax

READ:PHVTime[:MEASview<y>]:OGRAm?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

#<num_digit><num_byte><data(1)><data(2)>...<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the phase at the n^{th} data point in degrees (deg), represented as a 4-byte little-endian IEEE 488.2 floating-point value.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:PHVTime:MEASview1:OGRAm? might return #43204xxxx... (3204-byte data) for the ogram trace.

READ:PHVTime[:MEASview<y>]:RESult? (Query Only)

Returns the Phase versus Time measurement results.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

READ:PHVTime[:MEASview<y>]:RESult?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<max>,<max_time>,<min>,<min_time>`

Where

`<max>::<NRf>` is the maximum phase in degrees.

`<max_time>::<NRf>` is the time in seconds at which the phase is maximum.

`<min>::<NRf>` is the minimum phase in degrees.

`<min_time>::<NRf>` is the time in seconds at which the phase is minimum.

Examples

`READ:PHVTIME:MEASview1:RESULT?` might return `153.8,175.3E-9,-176.3,450.7E-9`, indicating the maximum phase is 153.8 ° at 175.3 ns and the minimum phase is -176.3 ° at 450.7 ns.

READ:PHVTime[:MEASview<y>]:TRACe:BITMap? (Query Only)

Acquires a waveform and then returns trace waveform data of the bitmap trace in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Read commands

Syntax

`READ:PHVTime[:MEASview<y>]:TRACe:BITMap?`

Arguments

None

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

The format is a binary block of 32 bit floating point values. Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Examples

`READ:PHVTIME:TRACE:BITMAP?` might return #42004xxxx... (2004-byte data) for the waveform data of the bitmap trace.

READ:PM:PNEGative? (Query Only)

Returns the negative peak phase deviation (–Pk) in the PM measurement.

Conditions

Measurement views: PM

Group

Read commands

Syntax

`READ:PM:PNEGative?`

Arguments

None

Returns

`<-Pk>::<NRf>` is the negative peak phase deviation in degrees.

Examples

`READ:PM:PNEGATIVE?` might return `-23.42`, indicating the positive peak phase deviation is −23.42 °.

READ:PM:PPOSitive? (Query Only)

Returns the positive peak phase deviation (+Pk) in the PM measurement.

Conditions

Measurement views: PM

Group

Read commands

Syntax

`READ:PM:PPOSitive?`

Arguments

None

Returns

`<+Pk>::<NRf>` is the positive peak phase deviation in degrees.

Examples

`READ:PM:PPOSITIVE?` might return `26.87`, indicating the positive peak phase deviation is 26.87°.

READ:PM:PTPeak? (Query Only)

Returns the peak-peak phase deviation (Pk-Pk) in the PM measurement.

Conditions

Measurement views: PM

Group

Read commands

Syntax

`READ:PM:PTPeak?`

Arguments

None

Returns

<Pk-Pk>::<NRf> is the peak-peak phase deviation in degrees.

Examples

READ:PM:PTPEAK? might return 46.34, indicating the peak-peak phase deviation is 46.34 °.

READ:PM:RESult? (Query Only)

Returns the PM measurement results.

Conditions

Measurement views: PM

Group

Read commands

Syntax

READ:PM:RESult?

Arguments

None

Returns

<+Pk>,<-Pk>,<RMS>,<Pk-Pk>

Where

<+Pk>::<NRf> is the positive peak phase deviation in degrees.

<-Pk>::<NRf> is the negative peak phase deviation in degrees.

<RMS>::<NRf> is the RMS phase deviation in degrees.

<Pk-Pk>::<NRf> is the peak-peak phase deviation in degrees.

Examples

READ:PM:RESULT? might return 22.89,-23.45,15.12,46.34.

READ:PM:RMS? (Query Only)

Returns the RMS phase deviation in the PM measurement.

Conditions

Measurement views: PM

Group

Read commands

Syntax

READ:PM:RMS?

Arguments

None

Returns

<RMS>::<NRf> is the RMS phase deviation in degrees.

Examples

READ:PM:RMS? might return 15.12, indicating the RMS frequency deviation is 15.12 °.

READ:PNOise:ALL? (Query Only)

Returns all results of the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

READ:PNOise:ALL?

Arguments

None

Returns

<Cpower>,<Ferror>,<Pnoise>,<Tjitter>,<Rjitter>,<RFM>

Where

<Cpower>::<NRf> is the carrier power in dBm.

<Ferror>::<NRf> is the frequency error in Hz.

<Pnoise>::<NRf> is the RMS phase noise in degrees.

<Tjitter>::<NRf> is the total jitter in seconds.

<Rjitter>::<NRf> is the random jitter in seconds.

<RFM>::<NRf> is the residual FMin Hz.

Examples

READ:PNOISE:ALL? might return -9.455,1.235E+6,51.43,2.312E-9,4.178E-9,14.58, indicating

Carrier power: -9.455 dBm,

Frequency error: 1.235 MHz,

RMS phase noise: 51.43 °,

Total jitter: 2.312 ns,

Random jitter: 4.178 ns, and

Residual FM: 14.58 Hz.

READ:PNOise:CARRier:FERRor? (Query Only)

Returns the carrier frequency error in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

`READ:PNOise:CARRier:FERRor?`

Arguments

None

Returns

`<NRf>` Carrier frequency error in Hz.

Examples

`READ:PNOISE:CARRIER:FERROR?` might return `1.235E+6`, indicating that the carrier frequency error is 1.235 MHz.

READ:PNOise:CARRier:POWer? (Query Only)

Returns the carrier power in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

`READ:PNOise:CARRier:POWer?`

Arguments

None

Returns

`<NRf>` Carrier power in dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:PNOISE:CARRIER:POWER?` might return `-9.455`, indicating that the carrier power is -9.455 dBm.

READ:PNOise:JITTer? (Query Only)

Returns the jitter in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

`READ:PNOise:JITTer?`

Arguments

None

Returns

`<NRf>` Jitter in seconds.

Examples

`READ:PNOISE:JITTER?` might return `2.312E-9`, indicating that the jitter is 2.312 ns.

READ:PNOise:RESidual:FM? (Query Only)

Returns the residual FM in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

`READ:PNOise:RESidual:FM?`

Arguments

None

Returns

`<NRf>` Residual FM in Hz.

Examples

`READ:PNOISE:RESIDUAL:FM?` might return `14.58`, indicating that the residual FM is 14.58 Hz.

READ:PNOise:RMS:PNOise? (Query Only)

Returns the RMS phase noise in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

READ:PNOise:RMS:PNOise?

Arguments

None

Returns

<NRf> RMS phase noise in degrees.

Examples

READ:PNOISE:RMS:PNOISE? might return 51.43, indicating that the RMS phase noise is 51.43 °.

READ:PNOise:SPECtrum<x>:X? (Query Only)

Returns the frequencies of the specified trace.

The parameter <x> = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

READ:PNOise:SPECtrum<x>:X?

Arguments

None

Returns

#<num_digit><num_byte><x(1)><x(2)>...<x(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)> is the frequency (Hz) at the nth point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:PNOISE:SPECTRUM1:X? might return #516020xxxx... (16020-byte data) for the frequencies of Trace 1.

READ:PNOise:SPECtrum<x>[:Y]? (Query Only)

Returns the phase noise values of the specified trace.

The parameter <x> = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

`READ:PNOise:SPECtrum<x>[:Y]?`

Arguments

None

Returns

`#<num_digit><num_byte><y(1)><y(2)>...<y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<y(n)>` is the phase noise (dBc/Hz) at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:PNOISE:SPECTRUM1:Y` might return `#516020xxxx...` (16020-byte data) for the phase noise values of Trace 1.

READ:PNOise:SPECtrum<x>:XY? (Query Only)

Returns the frequency and phase noise pairs of the specified trace.

The parameter <x> = 1 and 2, representing Trace 1 and Trace 2, respectively.

Conditions

Measurement views: Phase noise

Group

Read commands

Syntax

`READ:PNOise:SPECtrum<x>:XY?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)><y(n)>` is the frequency (Hz) and phase noise (dBc/Hz) pair at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:PNOISE:SPECTRUM1:XY?` might return `#516020xxxx...` (16020-byte data) for the frequency and phase noise pairs of the Trace 1.

READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:HIGHer? (Query Only)

Returns the outliers value exceeding the upper limit in pulse cumulative histogram.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Read commands

Syntax

`READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:HIGHer?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>` Number of outliers above higher limit

Examples

`READ:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:OUTLIER:HIGHER?` might return 0.000, which is the value for the outliers that have exceeded the upper limit in the pulse cumulative histogram.

READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:LOWer? (Query Only)

Returns the outliers value below the lower limit in pulse cumulative histogram.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Read commands

Syntax

`READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:LOWer?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>` Number of outliers below lower limit

Examples

`READ:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:OUTLIER:LOWER?` might return `0.000`, which is the value for the outliers below the lower limit in the pulse cumulative histogram.

READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:COUNt? (Query Only)

Returns the current events and status conditions for the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Read commands

Syntax

`READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where `<ecode>::<NR1> is the error/event code (-32768 to 32767).`

`<edesc>::<string>` is the description of the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, then response is `0, "No events to report"`.

Examples

`READ:PULSe:CUMulative:HISTogram:MEASview1:EVENTS` might return `0, "No events to report"`.

READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:TOTal? (Query Only)

Returns the total number of pulses in the pulse cumulative histogram.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Read commands

Syntax

`READ:PULSe:CUMulative:HISTogram[:MEASview<y>]:PULse:TOTal?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>` Total number of pulses

Examples

READ:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:PULSE:TOTAL? might return 16 for total number pulses in the pulse cumulative histogram.

READ:PULSe:CUMulative:STATistics[:MEASview<y>](Query Only)

Returns the PulseCount, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average and Standard Deviation values for the selected measurement in pulse cumulative statistics.

Conditions

Measurement views: Pulse Cumulative Statistics

Group

Read commands

Syntax

READ:PULSe:CUMulative:STATistics[:MEASview<y>]? <arg1><arg2>

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<arg1> = {AVERage| PPOWer| ATX| WIDTh| RISE| FALL| RINTerval| RRATe|DUTPct| DUTRatio| RIPPle| RIPDb| DROop| DRODb| OVERshoot| OVEDb|PPPHase| PPFRequency| RMSFreqerror| MFReqerror| RMSPherror| MPHerror|FRDeviation| FDELta| PHDeviation| IRAMplitude| IRTime| PPPD| PPFD| FABS}

<arg2> = {TPCOunt | MAX | MAXTs | MIN | MINTs | PK2PK | AVG | SD | ALL}

Returns

<puls_cnt> | <max> | <max_timstmp> | <min> | <min_timstmp> | <pk_pk> |<avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> |<rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> |<droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> |<rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err>| <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> |<imp_resp_amp> | <imp_resp_time>

where

<avg_on>::<NRf> is the average power transmitted during pulse on

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>:: <NRf> is the average power transmitted

<width>::<NRf> is the time from the rising edge to the falling edge at the −3 dB / −6 dB level (50%) of the user selected 100% level

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs. Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

Examples

READ:PULSe:CUMulative:STATistics:MEASview1? AVERage, MAX might return -1.3594852284, indicating the max value for Average ON is -1.3594852284.

READ:PULSe:OGRAm[:MEASview<y>]:MAX:FRAMe:COUNt (Query Only)

Returns the frame count value in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Read commands

Syntax

READ:PULSe:OGRAm[:MEASview<y>]:MAX:FRAMe:COUNt?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<NRf>

Examples

READ:PULSe:OGRAm:MEASview1:MAX:FRAMe:COUNt? might return 20, indicating the total number of fast frames in the acquisition of Pulse-Ogram is 20.

READ:PULSe:OGRAm[:MEASview<y>]:RBW (Query Only)

Returns the resolution bandwidth value only when Frequency vs Time display is opened in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Read commands

Syntax

READ:PULSe:OGRAm[:MEASview<y>]:RBW?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<NRf>

Examples

READ:PULSe:OGRAm:MEASview1:RBW? might return 222.9199886322E+3, indicating the RBW value is 222.9199886322E+3 in Pulse-Ogram.

READ:PULSe[:RESult][:MEASview<y>]:ADVanced (Query Only)

Returns the Pulse Count, Max, Max at Pulse number, Min, Min at Pulse number, Peak to Peak, Average and Standard Deviation values for the chosen measurement in pulse table.

Conditions

Measurement views: All

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:ADVanced <arg1>,<arg2>

Arguments

arg1 can be one of the following measurements:

{AVERage| PPOWer| ATX|WIDTh| RISE| FALL| RINTerval| RRATe|DUTPct| DUTRatio|RIPPle| RIPDb| DROop| DRODb| OVERshoot|OVEDb| PPPHase| PPFRequency| RMSFreqerror| MFReqerror|RMSPherror| MPHerror| FRDeviation| FDELta| PHDeviation|IRAMplitude|IRTime|PPPD|PPFD|FABS}

arg2 can be one of the following statistics results:

{TPCOunt|MAX|MAXTs|MIN|MINTs|PK2PK|AVG|SD|ALL}

Returns

<puls_cnt> | <max> | <min> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements, where

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>:: <NRf> is the average power transmitted

<width>::<NRf> is the time from the rising edge to the falling edge at the −3 dB / −6 dB level (50%) of the user selected 100% level

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set.

Examples

READ:PULSe:RESult:MEASview2:ADVanced AVERage, MAX might return -1.3594852284 for Average ON value in pulse cumulative statistics

READ:PULSe[:RESult][:MEASview<y>]:ADVanced:RANGe (Query only)

Queries the Pulse Count, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average, and Standard Deviation values for the select measurement in the Pulse Table display.

Conditions

Measurement views: Pulse Table

Group

Fetch commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:ADVanced:RANGe <arg1><arg2><arg3>

Arguments

<arg1>={Start_Pulse_number}

<arg2>={End_Pulse_number}

<arg3>= {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror |MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude|TIME | IRTime | PPPD| PPFD | FABS}

Returns

<puls_cnt> | <max> | <max_timstmp> | <min> | <min_timstmp> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number.

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on.

<avg_tx>:: <NRf> is the average power transmitted.

<width>::<NRf> is the time from the rising edge to the falling edge at the −3 dB or −6 dB level (50%) of the user selected 100% level.

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% or (20% to 80%) of the user selected 100% level.

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% or (80% to 20%) of the user selected 100% level.

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge.

<rep_rate> ::<NRf> is the inverse of repetition interval.

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage.

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period.

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top.

<ripple_db>::<NRf> is the Ripple measurement expressed in dB.

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time.

<droop_db>::<NRf> is the Droop measurement expressed in dB.

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge.

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB.

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window.

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse.

<rms_phase_err>::<NRf> is the RMS average of the Phase versus Time trace, computed over the Measurement Time.

<rms_freq_err>::<NRf> is the RMS average of the Freq error versus Time trace.

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse.

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse.

<pk_phase_err>::<NRf> is the maximum phase error.

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point.

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time.

<phase_dev>::<NRf> is the Phase deviation difference between the maximum and minimum Phase values measured during the On time of a pulse.

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency.

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe.

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe.

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set.

Example

READ:PULSE[:RESULT]:MEASview1:ADVANCED:RANGe 2048,2060,AVERage might return
-3,23.8467659801E-3,23.8566566259E-3,23.8667335361E-3,23.8771531731E-3,23.8866508007E-3,23.89664
indicating the average ON value for the pulse number from 2048 to 2060.

READ:PULSe:STATistics[:MEASview<y>]:ADVanced (Query Only)

Returns the Pulse Count, Max, Max at Pulse number, Min, Min at Pulse number, Peak to Peak, Average and Standard Deviation values for the chosen measurement in Pulse Statistics display.

Conditions

Measurement views: Pulse Statistics

Group

Read commands

Syntax

```
READ:PULSe:STATistics:[:MEASview<y>]:ADVanced <arg1>,<arg2>
READ:PULSe:STATistics:[:MEASview<y>]:AD;Vanced?
```

Arguments

<arg1> = {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror |MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude|TIME | IRTime | PPPD| PPFD | FABS}

<arg2> = {TPCOunt |MAX |MIN |PK2PK |AVG |SD |ALL}

Returns

<puls_cnt> | <max> | <min> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>:: <NRf> is the average power transmitted

<width>::<NRf> is the time from the rising edge to the falling edge at the -3 dB /−6 dB level (50%) of the user selected 100% level

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>:: <NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set

Examples

`READ:PULSE:STATISTICS:MEASview1:ADVANCED RISE, MAX` might return `7.9786177665E-9,"-"`, indicating the maximum rise value is 7.9786177665E-9.

READ:PULSe[:RESult][:MEASview<y>]:ATX (Query Only)

Returns the average transmitted power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

```
READ:PULSe[:RESult][:MEASview<y>]:ATX?
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

```
<first_pulse_num>,<ATX(1)>,< ATX(2)>,...<ATX(n)>
```

Where

<first_pulse_num>::<NR1> is the first pulse number.

<ATX(n)>::<NRf> is the average transmitted power for the pulse with the number of [first_pulse_num + n - 1] in dBm.

The unit can be changed to watts by the [SENSe]:POWer:UNITs command.

This measurement gives valid results only for power units (Watts, dBm, dBuW, dBW).

Examples

READ:PULSe:RESult:MEASview2:ATX? might return 0,-18.57,-18.73,-18.20, -18.53 for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:AVERage (Query Only)

Returns the average on power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:AVERage?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<avg(1)>,< avg(2)>,...<avg(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<avg(n)>::<NRf> is the average on power for the pulse with the number of [first_pulse_num + n - 1] in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs (on page 2319) command.

This measurement gives valid results only for power units (Watts, dBm, dBuW, dBW).

Examples

READ:PULSe:RESult:MEASview2:AVERage? might return 0,-2.354,-2.368,-2.343,-2.358 for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:DRODb (Query Only)

Returns the droop in dB in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

```
READ:PULSe[:RESult][:MEASview<y>]:DRODb?
```

Related Commands

READ:PULSe[:RESult][:MEASview<y>]:DROop? (on page 1825)

Arguments

None

Returns

`<first_pulse_num>,<droop(1)>,<droop(2)>,...<droop(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<droop(n)>::<NRf>` is the droopdB for the pulse number [first_pulse_num + n - 1] in percent (%) of watts or volts.

Examples

`READ:PULSe:RESult:MEASview2:DRODb?` might return `1,-0.4,0.32,0.2,-0.1` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:DROop (Query Only)

Returns the average on power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

```
READ:PULSe[:RESult][:MEASview<y>]:DROop?
```

Related Commands

READ:PULSe[:RESult][:MEASview<y>]:DRODb? (on page 1824)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<droop(1)>,<droop(2)>,...<droop(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<droop(n)>::<NRf>` is the droop for the pulse number [first_pulse_num + n - 1] in percent (%) of watts or volts.

Examples

`READ:PULSe:RESult:MEASview2:DROop?` might return `0,-270.9E-3,-193.0E-3, -242.7E-3,-177.5E-3` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:DUTPct (Query Only)

Returns the duty factor (%) in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:DUTPct?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<duty_pct(1)>,<duty_pct(2)>,...<duty_pct(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<duty_pct(n)>::<NRf>` is the duty factor for the pulse with the number of [first_pulse_num + n - 1] in percent (%).

Examples

`READ:PULSe:RESult:MEASview2:DUTPct?` might return `0,28.94,28.96,29.00,29.01` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:DUTRatio (Query Only)

Returns the duty factor (ratio) in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:DUTRatio?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<duty_ratio(1)>,<duty_ratio(2)>,… <duty_ratio(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<duty_ratio(n)>::<NRf>` is the duty factor for the pulse with the number of [first_pulse_num + n - 1] (no unit).

Examples

`READ:PULSe:RESult:MEASview2:DUTRatio?` might return `0,289.4E-3,289.6E-3, 290.0E-3,290.1E-3` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:FABS (Query Only)

Returns the computed absolute frequency from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:FABS?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<abs_freq(1)>,<abs_freq(2),.....<abs_freq(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<abs_freq(n)>::<NR1>` is the absolute frequency for the pulse with the number of [first_pulse_num + n — 1] in Hz.

Examples

`READ:PULSe:RESult:MEASview2:FABS?` might return `1.0000000000, 919.8726400000E+6, 1.1664642560E+9, 1.1866586880E+9, 1.1867939840E+9, 1.1882243840E+9, 933.2595840000E+6, 1.1729175040E+9, 1.1818649600E+9, 1.1868037120E+9, 1.1832893440E+9, 933.4762880000E+6, 1.1805880320E+9, 1.1844794880E+9, 1.1914785280E+9, 1.1929450240E` for is the number of the first pulse and the absolute frequency for each pulse.

READ:PULSe[:RESult][:MEASview<y>]:FALL (Query Only)

Returns the fall time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:FALL?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<fall(1)>,<fall(2)>,...<fall(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<fall(n)>::<NRf> is the fall time for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

READ:PULSe:RESult:MEASview2:FALL? might return 0,110.3E-9,90.45E-9, 95.03E-9,111.9E-9 for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:FDELta (Query Only)

Returns the computed delta frequency from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:FDELta?

Arguments

None

Returns

<first_pulse_num>,<freq_delta(1)>,<freq_delta(2)>,…<freq_delta(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<freq_delta(n)>::<NRf> is the frequency delta for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

READ:PULSe:RESult:MEASview2:FDELta? might return
1.0000000000,163.6692962646,82.8298492432,21.8995475769,
89.2963562012,48.1314239502,144.1430664063,52.5188140869,
19.9404506683,287.8957519531,110.4534988403,-110.1940994263,
73.9322433472,115.7962646484,164.6119384766,-42.2758331299, 223.0057525635,28.680925 for the first pulse and each pulse found.

READ:PULSe[:RESult][:MEASview<y>]:FRDeviation (Query Only)

Returns the frequency deviation in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:FRDeviation?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<freq_dev(1)>,<freq_dev(2)>,...<freq_dev(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<freq_dev(n)>::<NRf>` is the frequency deviation for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`READ:PULSe:RESult:MEASview2:FRDeviation?` might return `1,740.6E+3,736.5E+3,718.3E+3,672.2E+3` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:IRAMplitude (Query Only)

Returns the pulse impulse response amplitude in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:IRAMplitude?`

Returns

`<first_pulse_num>,<amplitude(1)>,<amplitude(2)>,...<amplitude(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<amplitude(n)>::<NRf>` is the sidelobe level, in dB, from the mainlobe for the pulse with the number of [first_pulse_num + n - 1].

Examples

`READ:PULSe:RESult:MEASview2:IRAMplitude?` might return `1.0000000000,-45.3,-47.5,-50.2` for Pulse 1 through 3.

READ:PULSe[:RESult][:MEASview<y>]:IRTime (Query Only)

Returns the impulse response time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:IRTime?`

Returns

`<first_pulse_num>,<time(1)>,<time(2)>,...<time(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<time(n)>::<NRf>` is the sidelobe offset time from the mainlobe for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`READ:PULSe:RESult:MEASview2:IRTime?` might return `1.0000000000,806.6708687693E-9,-846.6595318168E-9,-873.3477443457E-9` for Pulse 1 to 3.

READ:PULSe[:RESult][:MEASview<y>]:MFReqerror (Query Only)

Returns the maximum frequency error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:MFReqerror?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<max_freq_err(1)>,<max_freq_err(2)>,...<max_freq_err(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<max_freq_err(n)>::<NRf>` is the maximum frequency error for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`READ:PULSe:RESult:MEASview2:MFReqerror?` might return `1,597.5E+3,675.8E+3,642.8E+3,598.2E+3` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:MPHerror (Query Only)

Returns the maximum phase error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:MPHerror?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<max_phase_err(1)>,<max_phase_err(2)>,...<max_phase_err(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<max_phase_err(n)>::<NRf>` is the maximum phase error for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

`READ:PULSe:RESult:MEASview2:MPHerror?` might return `1,-9.221,-8.413, -11.853,-10.258` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:OVERDb (Query Only)

Returns the overshoot in dB in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:OVERDb?`

Related Commands

READ:PULSe[:RESult][:MEASview<y>]:OVERshoot? (on page 1832)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<overshoot(1)>,<overshoot(2)>,...<overshoot(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

<overshoot(n)>::<NRf> is the overshoot for the pulse with the number of [first_pulse_num + n - 1] in dB.

Examples

READ:PULSe:RESult:MEASview2:OVERDb? might return 1,1.2,2.3,1.0,0.2 for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:OVERshoot (Query Only)

Returns the overshoot in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:OVERshoot?

Related Commands

READ:PULSe[:RESult][:MEASview<y>]:OVERDb? (on page 1831)

Arguments

None

Returns

<first_pulse_num>,<overshoot(1)>,<overshoot(2)>,...<overshoot(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<overshoot(n)>::<NRf> is the overshoot for the pulse with the number of [first_pulse_num + n - 1] in percent (%) of watts or volts.

Examples

READ:PULSe:RESult:MEASview2:OVERshoot? might return 1,1.2,2.3,1.0,0.2 for Pulse 1 through 4.

READ:PULSe[:RESult][:MEASview<y>]:PHDeviation (Query Only)

Returns the phase deviation in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:PHDeviation?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<phase_dev(1)>,<phase_dev(2)>,...<phase_dev(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<phase_dev(n)>::<NRf>` is the phase deviation for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

`READ:PULSe:RESult:MEASview2:PHDeviation?` might return `1,11.658,9.640,10.509,8.272` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:PPFD (Query Only)

Returns the computed pulse to pulse frequency difference from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:PPFD`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<ppfd(1)>,<ppfd(2),.....<ppfd(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<ppfd(n)>::<NRf>` is the pulse to pulse frequency difference with the number of [first_pulse_num + n − 1] in Hz.

Examples

`READ:PULSe:RESult:MEASview2:PPFD?` might return `1.0000000000,"-", 246.5916160000E+6, 20.1943520000E+6, 135.2960000000E+3, 1.4304160000E+6, -254.9647520000E+6, 239.6579520000E+6, 8.9474560000E+6, 4.9386560000E+6, -3.5143840000E+6, -249.8130240000E+6, 247.1117760000E+6, 3.8915200000E+6, 6.9989120000E+6, 1.4665920000E+6` is the number of the first pulse and the pulse frequency difference for each pulse.

READ:PULSe[:RESult][:MEASview<y>]:PPFRequency (Query Only)

Returns the pulse-pulse carrier frequency in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:PPFRequency?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<pp_freq(1)>,<pp_freq(2)>,...<pp_freq(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<pp_freq(n)>::<NRf>` is the pulse-pulse carrier frequency for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`READ:PULSe:RESult:MEASview2:PPFRequency?` might return `0,0.000,1.258E+3,-3.121E+3,1.862E+3` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:PPOWer (Query Only)

Returns the peak power in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:PPOWer?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<pk_power(1)>,<pk_power(2)>,...<pk_power(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<pk_power(n)>::<NRf>` is the peak power for the pulse with the number of [first_pulse_num + n - 1] in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs command.

This measurement gives valid results only for power units(Watts, dBm, dBuW, dBW).

Examples

READ:PULSe:RESult:MEASview2:PPOWer? might return 0,-2.26,-2.27,-2.23,-2.25 for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:PPPD (Query Only)

Returns the computed pulse to pulse phase difference from the carrier in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:PPPD

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<pppd(1)>,<pppd(2),.....<pppd(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<pppd(n)>::<NRf> is the pulse to pulse phase difference with the number of [first_pulse_num + n − 1] in Hz.

Examples

READ:PULSe:RESult:MEASview2:PPPD? might return 1.0000000000,"-", 96.2469482422, 24.9118175507, 5.8206896782, 16.7037734985, -151.8063964844, 100.7584228516,36.6761512756, -3.8614616394, 12.9028282166, -150.9820556641, 130.5854492188, 9.1259155273, -7.4177660942, 6.0613451004, -142.4224853516 is the number of the first pulse and the pulse to pulse phase difference for each pulse.

READ:PULSe[:RESult][:MEASview<y>]:PPPHase (Query Only)

Returns the pulse-pulse carrier phase in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:PPPHase?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<pp_phase(1)>,<pp_phase(2)>,...<pp_phase(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<pp_phase(n)>::<NRf> is the pulse-pulse carrier phase for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

READ:PULSe:RESult:MEASview2:PPPHase? might return 0,0.000,21.66,46.76,57.56 for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:RINTerval (Query Only)

Returns the repetition interval in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:RINTerval?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<rep_int(1)>,<rep_int(2)>,...<rep_int(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<rep_int(n)>::<NRf> is the repetition interval for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

READ:PULSe:RESult:MEASview2:RINTerval? might return 0,16.03E-6,16.08E-6, 16.07E-6,16.02E-6 for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:RIPDb (Query Only)

Returns the ripple in dB in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:RIPDb?

Related Commands

READ:PULSe[:RESult][:MEASview<y>]:RIPPle? (on page 1837)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<ripple(1)>,<ripple(2)>,...<ripple(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<ripple(n)>::<NRf>` is the ripple for the pulse with the number of [first_pulse_num + n - 1] in dB.

Examples

`READ:PULSe:RESult:MEASview2:RIPDb?` might return `1,0.4,0.32,0.2,0.1` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:RISE (Query Only)

Returns the rise time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:RISE?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<rise(1)>,<rise(2)>,...<rise(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<rise(n)>::<NRf>` is the rise time for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`READ:PULSe:RESult:MEASview2:RISE?` might return `0,92.94E-9,115.9E-9, 115.1E-9,97.45E-9` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:RIPPle (Query Only)

Returns the ripple in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:RIPPle?`

Related Commands

READ:PULSe[:RESult][:MEASview<y>]:RIPDb? (on page 1836)

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<ripple(1)>,<ripple(2)>,...<ripple(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<ripple(n)>::<NRf>` is the watt or voltage ripple for the pulse with the number of [first_pulse_num + n - 1] in percent (%).

Examples

`READ:PULSe:RESult:MEASview2:RIPPle?` might return `0,106.5E-3,177.6E-3, 148.3E-3,148.5E-3` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:RMSFreqerror (Query Only)

Returns the RMS frequency error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:RMSFreqerror?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<RMS_freq_err(1)>,<RMS_freq_err(2)>,...<RMS_freq_err(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

<RMS_freq_err(n)>::<NRf> is the RMS frequency error for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

READ:PULSe:RESult:MEASview2:RMSFreqerror? might return 1,51.54E+3, 69.20E+3,64.21E+3,51.02E+3 for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:RMSPherror (Query Only)

Returns the RMS phase error in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:RMSPherror?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<first_pulse_num>,<RMS_phase_err(1)>,<RMS_phase_err(2)>,...<RMS_phase_err(n)>

Where

<first_pulse_num>::<NR1> is the first pulse number.

<RMS_phase_err(n)>::<NRf> is the RMS phase error for the pulse with the number of [first_pulse_num + n - 1] in degrees.

Examples

READ:PULSe:RESult:MEASview2:RMSPherror? might return 1,908.4E-3,752.8E-3,981.7E-3,886.4E-3 for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:RRATe (Query Only)

Returns the repetition rate in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

READ:PULSe[:RESult][:MEASview<y>]:RRATe?

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<rep_rate(1)>,<rep_rate(2)>,…<rep_rate(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<rep_rate(n)>::<NRf>` is the repetition rate for the pulse with the number of [first_pulse_num + n - 1] in Hz.

Examples

`READ:PULSe:RESult:MEASview2:RRATe?` might return `0,62.50E+3,62.52E+3, 62.51E+3,62.49E+3` for Pulse 0 to 3.

READ:PULSe[:RESult][:MEASview<y>]:TIME (Query Only)

Returns the time in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

`READ:PULSe[:RESult][:MEASview<y>]:TIME`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<time(1)>,<time(2)>,...<time(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<time(n)>::<NRf>` is the time for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`READ:PULSe:RESult:MEASview2:TIME?` might return `1,7.937E-3,8.436E-3, 6.504E-3,9.876E-3` for Pulse 1 to 4.

READ:PULSe[:RESult][:MEASview<y>]:WIDTh (Query Only)

Returns the pulse width in the pulse table.

Conditions

Measurement views: Pulse table

Group

Read commands

Syntax

```
READ:PULSe[:RESult][:MEASview<y>]:WIDTh?
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<first_pulse_num>,<width(1)>,<width(2)>,...<width(n)>`

Where

`<first_pulse_num>::<NR1>` is the first pulse number.

`<width(n)>::<NRf>` is the pulse width for the pulse with the number of [first_pulse_num + n - 1] in seconds.

Examples

`READ:PULSe:RESult:MEASview2:WIDTh?` might return `0,4.630E-6,4.632E-6, 4.639E-6,4.642E-6` for Pulse 0 to 3.

READ:PULSe:STATistics[:MEASview<y>] (Query Only)

Returns the trace data of the pulse statistics measurement selected by the `DISPlay:PULSe:SELect:RESult` command.

NOTE: Select the plot type (Trend, FFT, Time Trend or Histogram) using the `DISPlay:PULSe:STATistics:PLOT` command before executing this query.

Conditions

Measurement views: Pulse statistics

Group

Read commands

Syntax

```
READ:PULSe:STATistics[:MEASview<y>]?
```

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the amplitude at the nth data point.

The unit is current measurement unit (Plot = Trend or Time Trend), dB (Plot = FFT), count or percent (Plot = Histogram)

4-byte little endian floating-point format specified in IEEE 488.2.

The unit of power is selected by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:PULSe:STATistics:MEASview1?` might return #264xxxx... (64-byte data) for the statistics trace of the pulse width measurement when `DISPlay:PULSe:SELect:RESult` is set to WIDTh.

READ:PULSe:STATistics[:MEASview<y>]:ADVanced (Query Only)

Returns the Pulse Count, Max, Max at Pulse number, Min, Min at Pulse number, Peak to Peak, Average and Standard Deviation values for the chosen measurement in pulse statistics display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:ADVanced? <arg1>,<arg2>`

Arguments

`arg1` can be one of the following measurements:

`{AVERage| PPOWer| ATX|WIDTh| RISE| FALL| RINTerval| RRATe|DUTPct| DUTRatio|RIPPle| RIPDb| DROop| DRODb| OVERshoot|OVEDb| PPPHase| PPFRequency| RMSFreqerror| MFReqerror|RMSPherror| MPHerror| FRDeviation| FDELta| PHDeviation|IRAMplitude|IRTime|PPPD|PPFD|FABS}`

`arg2` can be one of the following statistics results:

`{TPCOunt|MAX|MIN|PK2PK|AVG|SD|ALL}`

Returns

`<puls_cnt>|<max>|<min>|pk_pk>|<avg>|std_dev>|<all>` for one of the following selected measurements.

Where

`<avg_on>|<pk_pwr>|<avg_tx>|<width>|<rise>|<fall>|<rep_int>|<rep_rate>|<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time>`

Where

`<avg_on>::<NRf>` is the average power transmitted during pulse on.

`<pk_pwr>::<NRf>` is the Maximum power during pulse on

`<avg_tx>:: <NRf>` is the average power transmitted

`<width>::<NRf>` is the time from the rising edge to the falling edge at the −3 dB /−6 dB level (50%) of the user selected 100% level

`<rise>::<NRf>` is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

`<fall> ::<NRf>` is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set.

Examples

READ:PULSe:STATistics:MEASview2:ADVanced RISE, MAX might return 7.9786177665E-9,"-", indicating the maximum rise value is 7.9786177665E-9.

READ:PULSe[:RESult]:ADVanced (Query Only)

Returns the PulseCount, Max, Max TimeStamp, Min, Min TimeStamp, Peak to Peak, Average, and Standard Deviation values for the chosen measurement in the Pulse Table display.

Conditions

Measurement views: All

Group

Read commands

Syntax

READ:PULSe[:RESult]:ADVanced? <arg1><arg2>

Arguments

<arg1> = {Pulse_number}

<arg2> = {AVERage | PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio |RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror | MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude|TIME | IRTime | PPPD| PPFD | FABS}

Returns

<puls_cnt> | <max> | <max_timstmp> | <min> | <min_timstmp> | <pk_pk> | <avg> | <std_dev> | <all>

For one of the following selected measurements:

<avg_on> | <pk_pwr> | <avg_tx> | <width> | <rise> | <fall> | <rep_int> | <rep_rate> | <duty_factor_pcnt> | <duty_fact_ratio> | <ripple> | <ripple_db> | <droop> | <droop_db> | <ovrshoot> | <ovrshoot_db> | <pp_phase> | <pp_freq> | <rms_phase_err> | <rms_freq_err> | <p2p_phase> | <p2p_freq> | <pk_phase_err> | <pk_freq_err> | <abs_freq> | <freq_dev> | <phase_dev> | <dlta_freq> | <imp_resp_amp> | <imp_resp_time>|<time> for the given pulse number

where

<avg_on>::<NRf> is the average power transmitted during pulse on.

<pk_pwr>::<NRf> is the Maximum power during pulse on

<avg_tx>:: <NRf> is the average power transmitted

<width>::<NRf> is the time from the rising edge to the falling edge at the −3 dB / −6 dB level (50%) of the user selected 100% level

<rise>::<NRf> is the time required for a signal to rise from 10% to 90% (or 20% to 80%) of the user selected 100% level

<fall> ::<NRf> is the time required for a signal to fall from 90% to 10% (or 80% to 20%) of the user selected 100% level

<rep_int>::<NRf> is the time from a pulse rising edge to the next pulse rising edge

<rep_rate> ::<NRf> is the inverse of repetition interval

<duty_factor_pcnt>::<NRf> is the ratio of the width to the pulse period, expressed as a percentage

<duty_fact_ratio>::<NRf> is the ratio of the pulse width to the pulse period

<ripple>::<NRf> is the Ripple is the peak-to-peak ripple on the pulse top

<ripple_db>::<NRf> is the Ripple measurement expressed in dB

<droop>::<NRf> is the Droop is the power difference between the beginning and the end of the pulse On time

<droop_db>::<NRf> is the Droop measurement expressed in dB

<ovrshoot>::<NRf> is the amount by which the signal exceeds the 100% level on the pulse rising edge

<ovrshoot_db>::<NRf> is the Overshoot measurement expressed in dB

<pp_phase>::<NRf> is the phase difference between the selected pulse and the previous pulse in the analysis window

<pp_freq> ::<NRf> is the difference between the frequency of the current pulse and frequency of the previous pulse

<rms_phase_err>::<NRf> is the RMS average of the Phase vs Time trace, computed over the Measurement Time

<rms_freq_err>::<NRf> is the RMS average of the Freq Error vs.Time trace

<p2p_phase>::<NRf> is the frequency difference between the current pulse and the first pulse

<p2p_freq>::<NRf> is the frequency difference between the current pulse and immediate previous pulse

<pk_phase_err>::<NRf> is the maximum phase error

<abs_freq>::<NRf> is the absolute pulse frequency measured at a specific point

<freq_dev>::<NRf> is the difference between the maximum and minimum measured values of the signal frequency during the Measurement Time

<phase_dev>::<NRf> is the Phase Deviation difference between the maximum and minimum Phase values measured during the On time of a pulse

<dlta_freq>::<NRf> is the difference from the measurement frequency to each pulse frequency

<imp_resp_amp>::<NRf> is the difference in dB between the levels of the main lobe and highest side lobe

<imp_resp_time>::<NRf> is the difference in time between the main lobe and highest side lobe

<time>::<NRf> is the dtime in seconds relative to the time reference point in the first acquisition record in the data set

Examples

READ:PULSE[:RESULT]:ADVANCED 1,AVERage might return -1.4063608208, indicating the average ON value for the pulse number 1 is −1.4063608208.

READ:PULSe:STATistics[:MEASview<y>]:AVERage (Query Only)

Returns the average on power in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:AVERage

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<avg_avg>,<avg_min>,< avg_max>

Where

<avg_avg>::<NRf> is the average of the average on power.

<avg_min>::<NRf> is the minimum of the average on power.

<avg_max>::<NRf> is the maximum of the average on power.

Unit: dBm.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:PULSe:STATistics:MEASview2:AVERage might return -2.35,-2.36,-2.34 for the average on power in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:DRODb (Query Only)

Returns the droop in dB in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

```
READ:PULSe:STATistics[:MEASview<y>]:DRODb
```

Related Commands

```
READ:PULSe:STATistics[:MEASview<y>]:DROop?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<droop_avg>,<droop_min>,<droop_max>`

Where

`<droop_avg>::<NRf>` is the average droop.

`<droop_min>::<NRf>` is the minimum droop.

`<droop_max>::<NRf>` is the maximum droop.

Unit: in dB by watts.

Examples

`READ:PULSe:STATistics:MEASview2:DRODb?` might return `22.67E-3,-613.5E-3, 633.8E-3` for the droop in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:DROop (Query Only)

Returns the droop in the pulse statistics.This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

```
READ:PULSe:STATistics[:MEASview<y>]:DROop
```

Related Commands

READ:PULSe:STATistics[:MEASview<y>]:DRODb? (on page 1846)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<droop_avg>,<droop_min>,<droop_max>`

Where

`<droop_avg>::<NRf>` is the average droop.

`<droop_min>::<NRf>` is the minimum droop.

`<droop_max>::<NRf>` is the maximum droop.

Unit: Percent (%) by watts.

Examples

`READ:PULSe:STATistics:MEASview2:DROop` might return `22.67E-3,-613.5E-3, 633.8E-3` for the droop in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:DUTPct (Query Only)

Returns the duty factor (%) in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:DUTPct`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<duty_pct_avg>,<duty_pct_min)>,<duty_pct_max>`

Where

`<duty_pct_avg>::<NRf>` is the average duty factor.

`<duty_pct_min>::<NRf>` is the minimum duty factor.

`<duty_pct_max>::<NRf>` is the maximum duty factor.

Unit: Percent (%).

Examples

`READ:PULSe:STATistics:MEASview2:DUTPct` might return `2.437,2.310,2.657` for the duty factor (%) in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:DUTRatio (Query Only)

Returns the duty factor (ratio) in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:DUTRatio`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<duty_ratio_avg>,<duty_ratio_min>,<duty_ratio_max)>`

Where

`<duty_ratio_avg>::<NRf>` is the average duty factor.

`<duty_ratio_min>::<NRf>` is the minimum duty factor.

`<duty_ratio_max>::<NRf>` is the maximum duty factor.

Unit: None.

Examples

`READ:PULSe:STATistics:MEASview2:DUTRatio?` might return `24.37E-3,23.11E-3, 26.57E-3` for the duty factor (ratio) in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:FABS (Query Only)

Returns the absolute frequency in pulse statistics.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:FABS`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<fabs_avg>,<fabs_min>,<fabs_max>`

Where

<fabs_avg>::<NRf> is the average of fabs.

<fabs_min>::<NRf> is the minimum of fabs.

<fabs_max>::<NRf> is the maximum of fabs.

Examples

READ:PULSe:STATistics:MEASview2:FABS might return 1.1196544000E+9,919.8726400000E+6,1.1929450240E+9 for the absolute frequency in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:FALL (Query Only)

Returns the fall time in the pulse statistics. .This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:FALL

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<fall_avg>,<fall_min>,<fall_max>

Where

<fall_avg>::<NRf> is the average fall time.

<fall_min>::<NRf> is the minimum fall time.

<fall_max>::<NRf> is the maximum fall time.

Unit: Seconds.

Examples

READ:PULSe:STATistics:MEASview2:FALL? might return 70.27E-9,69.62E-9, 71.27E-9 for the fall time in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:FDELta (Query Only)

Return the delta frequency measurement in the pulse statistics.

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:FDELta

Arguments

None

Returns

<freq_delta_avg>,<freq_delta_min>,<freq_delta_max>

Where

<freq_delta_avg>::<NRf> is the average frequency deviation.

<freq_delta_min>::<NRf> is the minimum frequency deviation.

<freq_delta_max>::<NRf> is the maximum frequency deviation.

Unit: Hz.

Examples

READ:PULSe:STATistics:MEASview2:FDELta? might return 77.9785690308,-110.1940994263,287.8957519531 for the frequency delta in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:FRDeviation (Query Only)

Returns the frequency deviation in the Pulse Statistics measurement. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:FRDeviation

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<freq_dev_avg>,<freq_dev_min>,<freq_dev_max>

Where

<freq_dev_avg>::<NRf> is the average frequency deviation.

<freq_dev_min>::<NRf> is the minimum frequency deviation.

<freq_dev_max>::<NRf> is the maximum frequency deviation.

Unit: Hz.

Examples

READ:PULSe:STATistics:MEASview2:FRDeviation? might return 754.1E+3, 660.5E+3,835.2E+3 for the frequency deviation in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:IRAMplitude (Query Only)

Returns the Pulse Impulse Response amplitude measurement in the pulse statistics.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:IRAMplitude`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<amp_avg>,<amp_min>,<amp_max>`

Where

`<amp_avg>::<NRf>` is the average of the impulse response amplitude.

`<amp_min>::<NRf>` is the minimum of the impulse response amplitude.

`<amp_max>::<NRf>` is the maximum of impulse response amplitude.

Unit: dB.

Examples

`READ:PULSe:STATistics:MEASview2:IRAMplitude?` might return `-45.3,-47.1,-43.2` for the impulse response amplitude in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:IRTime (Query Only)

Returns the impulse response time in the pulse statistics.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:IRTime`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<avg_avg>,<avg_min>,<avg_max>`

Where

<avg_avg>::<NRf> is the average of the impulse response time.

<avg_min>::<NRf> is the minimum of the impulse response time.

<avg_max>::<NRf> is the maximum of impulse response time.

Unit: seconds.

Examples

READ:PULSe:STATistics:MEASview2:IRTime? might return -2.35,-2.36,-2.34 for the impulse response time in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:MAX:PULSe:NUMber (Query Only)

Returns the maximum value at a certain pulse number in the pulse statistics display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:MAX:PULSe:NUMber

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<max_pulse_no>

Where

<max_pulse_no>::<NRf> is the maximum value at a pulse number.

Examples

READ:PULSe:STATistics:MEASview2:MAX:PULSe:NUMber? might return 15 for the maximum pulse number in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:MFReqerror (Query Only)

Returns the maximum frequency error in the pulse statistics measurement. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:MFReqerror`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<max_freq_err_avg>,<max_freq_err_min>,<max_freq_err_max>`

Where

`<max_freq_err_avg>::<NRf>` is the average of maximum frequency error.

`<max_freq_err_min>::<NRf>` is the minimum of maximum frequency error.

`<max_freq_err_max>::<NRf>` is the maximum of maximum frequency error.

Unit: Hz.

Examples

`READ:PULSe:STATistics:MEASview2:MFReqerror?` might return `645.0E+3,555.6E+3,738.8E+3` for the maximum frequency error in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:MIN:PULSe:NUMber? (Query Only)

Returns the minimum value at a certain pulse number in pulse statistics.

Conditions

Measurement views: Pulse statistics

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:MIN:PULSe:NUMber?`

Arguments

None

Returns

`<min_pulse_no>`

Where

`<min_pulse_no>::<NRf>` is the minimum value at a pulse number.

Examples

`READ:PULSE:STATISTICS:MEASview1:MIN:PULSE:NUMBER?` might return `1` for the minimum pulse number in the pulse statistics

READ:PULSe:STATistics[:MEASview<y>]:MPHerror (Query Only)

Returns the maximum phase error in the Pulse Statistics measurement . This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:MPHerror`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<max_phase_err_avg>,<max_phase_err_min>,<max_phase_err_max>`

Where

`<max_phase_err_avg>::<NRf>` is the average of maximum phase error.

`<max_phase_err_min>::<NRf>` is the minimum of maximum phase error.

`<max_phase_err_max>::<NRf>` is the maximum of maximum phase error.

Unit: Degrees.

Examples

`READ:PULSe:STATistics:MEASview2:MPHerror?` might return `-11.47,-17.18,-7.61` for the maximum phase error in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:OVEDb (Query Only)

Returns the overshoot measurement result in dB in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd` or `TTRend`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:OVEDb`

Related Commands

READ:PULSe:STATistics[:MEASview<y>]:OVERshoot (on page 1855)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<overshoot_avg>,<overshoot_min>,<overshoot_max>

Where

<overshoot_avg>::<NRf> is the average overshoot.

<overshoot_min>::<NRf> is the minimum overshoot.

<overshoot_max>::<NRf> is the maximum overshoot.

Unit: dB.

Examples

READ:PULSe:STATistics:MEASview2:OVEDb might return 0.3,0.1,0.5 for the overshoot measurement result in dB in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:OVERshoot (Query Only)

Returns the overshoot in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:OVERshoot

Related Commands

READ:PULSe:STATistics[:MEASview<y>]:OVEDb (on page 1854)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<overshoot_avg>,<overshoot_min>,<overshoot_max>

Where

<overshoot_avg>::<NRf> is the average overshoot.

<overshoot_min>::<NRf> is the minimum overshoot.

<overshoot_max>::<NRf> is the maximum overshoot.

Unit: Percent (%) as watts or volts.

Examples

READ:PULSe:STATistics:MEASview2:OVERshoot might return 0.3,0.1,0.5 for the overshoot in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:PHDeviation (Query Only)

Returns the phase deviation in the Pulse Statistics measurement. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:PHDeviation`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<phase_dev_avg>,<phase_dev_min>,<phase_dev_max>`

Where

`<phase_dev_avg>::<NRf>` is the average phase deviation.

`<phase_dev_min>::<NRf>` is the minimum phase deviation.

`<phase_dev_max>::<NRf>` is the maximum phase deviation.

Unit: Degrees.

Examples

`READ:PULSe:STATistics:MEASview2:PHDeviation` might return `11.678,7.694, 17.374` for the phase deviation in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:PPFD (Query Only)

Returns the pulse-pulse frequency difference in the Pulse Statistics measurement display.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:PPFD`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<ppfd_avg>,<ppfd_min>,<ppfd_max>`

Where

<ppfd_avg>::<NRf> is the average of ppfd.

<ppfd_min>::<NRf> is the minimum of ppfd.

<ppfd_max>::<NRf> is the maximum of ppfd.

Examples

READ:PULSe:STATistics:MEASview2:PPFD? might return 365.4186562500E+3,-267.5911040000E+6,247.1117760000E+6 for the pulse-pulse frequency difference in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:PPFRequency (Query Only)

Returns the pulse-pulse carrier frequency in the pulse statistics measurement. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:PPFRequency

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<pp_freq_avg>,<pp_freq_min)>,<pp_freq_max>

Where

<pp_freq_avg>::<NRf> is the average pulse-pulse carrier frequency.

<pp_freq_min>::<NRf> is the minimum pulse-pulse carrier frequency.

<pp_freq_max>::<NRf> is the maximum pulse-pulse carrier frequency.

Unit: Hz.

Examples

READ:PULSe:STATistics:MEASview2:PPFRequency? might return 1.135E+3,311.3E+3,-262.8E+3 for the pulse-pulse carrier frequency in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:PPOWer (Query Only)

Returns the peak power in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:PPOWer`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<pk_power_avg>,<pk_power_min>,<pk_power_max>`

Where

`<pk_power_avg>::<NRf>` is the average peak power.

`<pk_power_min>::<NRf>` is the minimum peak power.

`<pk_power_max>::<NRf>` is the maximum peak power.

Unit: dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:PULSe:STATistics:MEASview2:PPOWer?` might return `-2.273,-2.313,-2.235` for the peak power in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:PPPD (Query Only)

Returns the overshoot measurement result in dB in the pulse statistics measurement. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd` or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:PPPD`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<pppd_avg>,<pppd_min>,<pppd_max>`

Where

`<pppd_avg>::<NRf>` is the average of pppd.

`<pppd_min>::<NRf>` is the minimum of pppd.

`<pppd_max>::<NRf>` is the maximum of pppd.

Examples

READ:PULSe:STATistics:MEASview2:PPPD? might return -1.1131216288, -151.8063964844,130.5854492188, indicating the pulse-pulse phase difference in dB.

READ:PULSe:STATistics[:MEASview<y>]:PPPHase (Query Only)

Returns the overshoot measurement result in dB in the pulse statistics measurement. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd or TTRend.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:PPPHase

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<pp_phase_avg>,<pp_phase_min>,<pp_phase_max>

Where

<pp_phase_avg>::<NRf> is the average pulse-pulse carrier phase.

<pp_phase_min>::<NRf> is the minimum pulse-pulse carrier phase.

<pp_phase_max>::<NRf> is the maximum pulse-pulse carrier phase.

Unit: Degrees.

Examples

READ:PULSe:STATistics:MEASview2:PPPHase? might return -9.298E-3,-254.3E-3,311.7E-3 for the pulse-pulse carrier phase in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RINTerval (Query Only)

Returns the repetition interval in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:RINTerval

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<rep_int_avg>,<rep_int_min>,<rep_int_max>

Where

<rep_int_avg>::<NRf> is the average repetition interval.

<rep_int_min>::<NRf> is the minimum repetition interval.

<rep_int_max>::<NRf> is the maximum repetition interval.

Unit: Seconds.

Examples

READ:PULSe:STATistics:MEASview2:RINTerval? might return 240.5E-6,217.9E-6,281.2E-6 for the repetition interval in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RIPDb (Query Only)

Returns the ripple in dB in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview]:RIPDb

Related Commands

READ:PULSe:STATistics[:MEASview]:RIPPle (on page 1861)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<ripple_avg>,<ripple_min>,<ripple_max>

Where

<ripple_avg>::<NRf> is the average ripple.

<ripple_min>::<NRf> is the minimum ripple.

<ripple_max>::<NRf> is the maximum ripple.

Unit: dB.

Examples

READ:PULSe:STATistics:MEASview2:RIPDb? might return 160.4E-3,83.78E-3,287.7E-3 for the ripple in dB in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RIPPle (Query Only)

Returns the ripple in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview]:RIPPle`

Related Commands

READ:PULSe:STATistics[:MEASview]:RIPDb (on page 1860)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<ripple_avg>,<ripple_min>,<ripple_max>`

Where

`<ripple_avg>::<NRf>` is the average ripple.

`<ripple_min>::<NRf>` is the minimum ripple.

`<ripple_max>::<NRf>` is the maximum ripple.

Unit: Percent (%) as watts or volts.

Examples

`READ:PULSe:STATistics:MEASview2:RIPPle?` might return `60.4E-3,83.78E-3,287.7E-3` for the ripple in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RISE (Query Only)

Returns the rise time in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:RISE`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<rise_avg>,<rise_min>,<rise_max>

Where

<rise_avg>::<NRf> is the average rise time.

<rise_min>::<NRf> is the minimum rise time.

<rise_max>::<NRf> is the maximum rise time.

Unit: Seconds.

Examples

READ:PULSe:STATistics:MEASview2:RISE? might return 105.4E-9,91.65E-9, 116.2E-9 for the rise time in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RMSFreqerror (Query Only)

Returns the RMS frequency error in the pulse statistics measurement. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:RMSFreqerror

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<RMS_freq_err_avg>,<RMS_freq_err_min>,<RMS_freq_err_max>

Where

<RMS_freq_err_avg>::<NRf> is the average of RMS frequency error.

<RMS_freq_err_min>::<NRf> is the minimum of RMS frequency error.

<RMS_freq_err_max>::<NRf> is the maximum of RMS frequency error.

Unit: Hz.

Examples

READ:PULSe:STATistics:MEASview2:RMSFreqerror? might return 63.67E+3,45.49E+3,81.28E+3 for the RMS frequency error in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RMSPherror (Query Only)

Returns the RMS phase error in the Pulse Statistics measurement. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:RMSPherror`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<RMS_phase_err_avg>,<RMS_phase_err_min>,<RMS_phase_err_max>`

Where

`<RMS_phase_err_avg>::<NRf>` is the average of RMS phase error.

`<RMS_phase_err_min>::<NRf>` is the minimum of RMS phase error.

`<RMS_phase_err_max>::<NRf>` is the maximum of RMS phase error.

Unit: Degrees.

Examples

`READ:PULSe:STATistics:MEASview2:RMSPherror?` might return `1.032,604.5E-3, 1.606` for the RMS phase error in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:RRATe (Query Only)

Returns the repetition rate in the pulse statistics. This command is valid when `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` is set to `TRENd`.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:RRATe`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<rep_rate_avg>,<rep_rate_min>,<rep_rate_max>

Where

<rep_rate_avg>::<NRf> is the average repetition rate.

<rep_rate_min>::<NRf> is the minimum repetition rate.

<rep_rate_max>::<NRf> is the maximum repetition rate.

Unit: Hz.

Examples

READ:PULSe:STATistics:MEASview2:RRATe? might return 62.50E+3,62.49E+3,62.52E+3 for the repetition rate in the pulse statistics measurement.

READ:PULSe:STATistics[:MEASview<y>]:WIDTh (Query Only)

Returns the pulse width in the pulse statistics. This command is valid when DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT is set to TRENd.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:STATistics[:MEASview<y>]:WIDTh

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<width_avg>,<width_min>,<width_max>

Where

<width_avg>::<NRf> is the average pulse width.

<width_min>::<NRf> is the minimum pulse width.

<width_max>::<NRf> is the maximum pulse width.

Unit: Seconds.

Examples

READ:PULSe:STATistics:MEASview2:WIDTh? might return 4.636E-6,4.630E-6,4.643E-6 for the pulse width in the pulse statistics.

READ:PULSe:STATistics[:MEASview<y>]:X (Query Only)

Returns the horizontal values of the trace data of the pulse statistics measurement selected by the DISPlay:PULSe:SELect:RESult command.

NOTE: Select the plot type (Trend, FFT, Time Trend or Histogram) using the `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` command before executing this query.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:X`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`#<num_digit><num_byte><data1><data2>....data<n>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the horizontal value of the statistics graph at the nth data point.

The unit is trace number (Plot = Trend), Hz (Plot = FFT), second (Plot = Time Trend) or current measurement unit (Plot = Histogram).

4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:PULSe:STATistics:MEASview2:X?` might return `#264xxxx...` (64-byte data) for the statistics trace of the pulse width measurement when `DISPlay:PULSe:SELect:RESult` is set to WIDTh.

READ:PULSe:STATistics[:MEASview<y>]:XY (Query Only)

Returns the horizontal and vertical values of the trace data of the pulse statistics measurement selected by the **DISPlay:PULSe:SELect:RESult** command.

NOTE: Select the plot type (Trend, FFT, Time Trend or Histogram) using the `DISPlay:PULSe:STATistics[:MEASview<y>]:PLOT` command before executing this query.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number

Group

Read commands

Syntax

`READ:PULSe:STATistics[:MEASview<y>]:XY`

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><data1><data2>....data<n>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the horizontal value of the statistics graph at the nth data point.

<data(n+1)> is the vertical value of the statistics graph at the nth data point.

For horizontal values, the unit is trace number (Plot = Trend), Hz (Plot = FFT), second (Plot = Time Trend) or current measurement unit (Plot = Histogram).

For vertical values, the unit is current measurement unit (Plot = Trend or Time Trend), dB (Plot = FFT), count (Plot = Histogram)

4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:PULSe:STATistics:MEASview2:XY? might return #264xxxx... (64-byte data) for the statistics trace of the pulse width measurement when DISPlay:PULSe:SELect:RESult is set to WIDTh.

READ:PULSe:TRACe[:MEASview<y>]:Y

Returns the vertical values of the pulse trace. Use the DISPlay:PULSe:SELect:NUMBer command to select the pulse, and the DISPlay:PULSe:SELect:RESult command to select the measurement result.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:TRACe[:MEASview<y>]:Y?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><y(1)><y(2)>...<y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<y(n)> is the vertical value of the pulse trace at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit depends on measurement results: Hz for frequency error and deviation, degrees for phase error and deviation, otherwise dBm. The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:PULSE:TRACE:MEASVIEW1:Y? might return #43204xxxx... (3204-byte data) for the vertical values of the pulse trace measurement view 1.

READ:PULSe:TRACe[:MEASview<y>]:X

Returns the time values of the pulse trace. Use the DISPlay:PULSe:SELect:NUMBer command to select the pulse, and the DISPlay:PULSe:SELect:RESult command to select the measurement result.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:TRACe[:MEASview<y>]:X?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><X(1)><X(2)>...<X(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<X(n)> is the time in seconds at the nth data point,

4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:PULSE:TRACE:MEASVIEW1:X? might return #43204xxxx... (3204-byte data) for the time values of the trace in pulse trace measurement view 1.

READ:PULSe:TRACe[:MEASview<y>]:XY

Returns the horizontal (time) and vertical value pairs of the pulse trace. Use the DISPlay:PULSe:SELect:NUMBer command to select the pulse, and the DISPlay:PULSe:SELect:RESult command to select the measurement result.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Read commands

Syntax

READ:PULSe:TRACe[:MEASview<y>]:XY?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)><y(n)> is the horizontal value (time in seconds) and vertical value pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The vertical unit depends on measurement results: Hz for frequency error and deviation, degrees for phase error and deviation, otherwise dBm. The vertical unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:PULSE:TRACE:MEASVIEW1:XY? might return #43204xxxx... (3204-byte data) for the horizontal (time) and vertical value pairs of the pulse trace measurement view 1.

READ:SEM:MHITs:COUNt? (Query Only)

Returns the number of rows in the results table in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs:COUNt?

Arguments

None

Returns

<NRf> The number of rows in the table.

Examples

READ:SEM:MHITS:COUNT? might return 7, indicating there are seven rows in the results table.

READ:SEM:MHITs<x>:AMPLitude:ABSolute? (Query Only)

Returns the absolute amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

`READ:SEM:MHITs<x>:AMPLitude:ABSolute?`

Arguments

None

Returns

`<NRf>` Absolute amplitude of the specified signal in dBm.

`<x>` specifies the row in the results table, where the range is from 1 to 12.

Examples

`READ:SEM:MHITs2:AMPLitude:ABSolute?` might return `-73.17` indicating that the absolute amplitude of signal in row 2 is –73.17 dBm.

READ:SEM:MHITs<x>:AMPLitude:RELative? (Query Only)

Returns the relative amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

`READ:SEM:MHITs<x>:AMPLitude:RELative?`

Arguments

None

Returns

`<NRf>` Relative amplitude of the specified signal in dBm.

`<x>` specifies the row in the results table, where the range is from 1 to 12.

Examples

`READ:SEM:MHITs2:AMPLitude:RELative?` might return `-91.81` indicating that the relative amplitude of mask hit signal in row 2 is –91.81 dBm.

READ:SEM:MHITs<x>:FREQuency? (Query Only)

Returns the frequency of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs<x>:FREQuency?

Arguments

None

Returns

<NRf> Frequency of the specified signal in Hz.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

READ:SEM:MHITs4:FREQuency? might return 2.235E+6, indicating the frequency for mask hit signal in row 4 is 2.235 MHz.

READ:SEM:MHITs<x>:INTeg:ABSolute? (Query Only)

Returns the absolute integration amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs<x>:INTeg:ABSolute?

Arguments

None

Returns

<NRf> Absolute integration amplitude of the specified signal in dBm.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

READ:SEM:MHITs4:INTeg:ABSolute? might return −75.14 indicating that the absolute integration amplitude for mask hit signal in row 4 is −75.14 dBM.

READ:SEM:MHITs<x>:INTeg:RELative? (Query Only)

Returns the relative integration amplitude of the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs<x>:INTeg:RELative?

Arguments

None

Returns

<NRf> Relative integration amplitude of the specified signal in dBm.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

READ:SEM:MHITs4:INTeg:RELative? might return -85.14 indicating that the relative integration amplitude for mask hit signal in row 4 is −85.14 dBM.

READ:SEM:MHITs<x>:MARGin:ABSolute? (Query Only)

Returns the absolute margin for the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs<x>:MARGin:ABSolute?

Arguments

None

Returns

<NRf> Absolute margin of the specified signal in dB.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

READ:SEM:MHITs4:MARGin:ABSolute? might return -62.33 indicating that the absolute margin for mask hit signal in row 4 is −62.33 dB.

READ:SEM:MHITs<x>:MARGin:RELative? (Query Only)

Returns the relative margin for the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs<x>:MARGin:RELative?

Arguments

None

Returns

<NRf> Relative margin of the specified signal in dB.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

READ:SEM:MHITs4:MARGin:RELative? might return -62.33 indicating that the relative margin for mask hit signal in row 4 is –62.33 dB.

READ:SEM:MHITs<x>:OFFSet? (Query Only)

Returns the offset for the specified mask hit signal in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:MHITs<x>:OFFSet?

Arguments

None

Returns

<NRf> specifies the mask hit offset.

<x> specifies the row in the results table, where the range is from 1 to 12.

Examples

READ:SEM:MHITs4:OFFSet? might return BL, indicating the offset for mask hit signal in row 4 is BL.

READ:SEM:PASS? (Query Only)

Returns the pass/fail limit test result in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:PASS?

Arguments

None

Returns

0 (fail) or 1 (pass)

Examples

`READ:SEM:PASS?` might return `1`, indicating that the limit test was successful.

READ:SEM:REF:POWer? (Query Only)

Returns the reference power level in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

`READ:SEM:REF:POWer?`

Arguments

None

Returns

`<NRf>` specifies the reference power.

Examples

`READ:SEM:REF:POWER?` might return `-16.92 dBm` indicating that the reference power level is –16.92 dBm.

READ:SEM:SPECtrum:X? (Query Only)

Returns the frequencies of the spectrum trace in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

`READ:SEM:SPECtrum:X?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

<num_byte> is the number of bytes of data that follow.

<x(n)> is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:SEM:SPECTRUM:X? might return #516020xxxx... (16020-byte data) for the frequencies of the spectrum trace.

READ:SEM:SPECtrum:XY? (Query Only)

Returns the frequency and amplitude pairs of the spectrum trace in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:SPECtrum:XY?

Arguments

None

Returns

#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<x(n)><y(n)> is the frequency (Hz) and amplitude (dBm) pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

READ:SEM:SPECTRUM:XY? might return #516020xxxx... (16020-byte data) for the frequency and amplitude pairs of the spectrum trace.

READ:SEM:SPECtrum[:Y]? (Query Only)

Returns the amplitude of the spectrum trace in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Read commands

Syntax

READ:SEM:SPECtrum[:Y]?

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)>` is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:SEM:SPECTRUM[:Y]?` might return `#516020xxxx...` (16020-byte data) for the frequencies of the spectrum trace.

READ:SGRam[:MEASview<y>](Query Only)

Returns the spectrogram trace data.The line is selected using the `TRACe:SGRam:MEASview<y>:SELect:LINE` command.

Conditions

Measurement views: Spectrogram

Group

Read commands

Syntax

`READ:SGRam[:MEASview<y>]?`

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the trace data in dBm for the point n, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:SGRam:MEASview1?` might return `#43204xxxx...` (3204-byte data) for the spectrogram trace.

READ:SPECtrum[:MEASview<y>]:TRACe<x>? (Query Only)

Returns the trace data in the Spectrum measurement.

NOTE: TRACe5 (spectrogram) is valid when the spectrum and spectrogram measurements are running.

Conditions

Measurement views: Spectrum

Group

Read commands

Syntax

`READ:SPECtrum[:MEASview<y>]:TRACe<x>?`

Arguments

The parameter <x> = 1 to 5.

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the trace data in dBm for the point n, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:SPECTRUM:MEASview1:TRACE1` might return `#43204xxxx...` (3204-byte data) for Trace 1 in the Spectrum measurement.

READ:SPECtrum[:MEASview<y>]:TRACe:BITMap? (Query Only)

Acquires a waveform and then returns trace waveform data of the bitmap trace in the Spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Read commands

Syntax

`READ:SPECtrum[:MEASview<y>]:TRACe:BITMap?`

Arguments

None

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

The format is a binary block of 32 bit floating point values. Each value ranges from 0 to 1.0, where 1.0 represents 100%.

Examples

`READ:SPECTRUM:TRACE:BITMAP?` might return #42004xxxx... (2004-byte data) for the waveform data of the bitmap trace.

READ:SPURious:CARRier:POWer? (Query Only)

Returns the carrier power in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

`READ:SPURious:CARRier:POWer?`

Arguments

None

Returns

`<NRf>` Carrier power in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs (on page 2319) command.

Examples

`READ:SPURIOUS:CARRIER:POWER?` might return `4.227`, indicating that the carrier power is 4.227 dBm.

READ:SPURious:COUNt? (Query Only)

Returns the number of spurious signals in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

`READ:SPURious:COUNt?`

Arguments

None

Returns

`<NRf>` The spurious count.

Examples

`READ:SPURIOUS:COUNT?` might return `4`, indicating that the spurious count is 4.

READ:SPURious:PASS? (Query Only)

Returns the pass/fail limit test result in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

`READ:SPURious:PASS?`

Arguments

None

Returns

0 (fail) or 1 (pass).

Examples

`READ:SPURIOUS:PASS?` might return `1`, indicating that the limit test was successful.

READ:SPURious:SPECtrum:X? (Query Only)

Returns the frequencies of the spectrum trace in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

`READ:SPURious:SPECtrum:X?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><x(2)>...<x(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)>` is the frequency (Hz) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:SPURIOUS:SPECTRUM:X?` might return `#516020xxxx...` (16020-byte data) for the frequencies of the spectrum trace in the Spurious measurement.

READ:SPURious:SPECtrum:XY? (Query Only)

Returns the frequency and amplitude pairs of the spectrum trace in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

`READ:SPURious:SPECtrum:XY?`

Arguments

None

Returns

`#<num_digit><num_byte><x(1)><y(1)><x(2)><y(2)>...<x(n)><y(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<x(n)><y(n)>` is the frequency (Hz) and amplitude (dBm) pair at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The amplitude unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:SPURIOUS:SPECTRUM:XY?` might return `#516020xxxx...` (16020-byte data) for the frequency and amplitude pairs of the spectrum trace in the Spurious measurement.

READ:SPURious:SPECtrum[:Y]? (Query Only)

Returns the amplitudes of the spectrum trace in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

`READ:SPURious:SPECtrum[:Y]?`

Related Commands

READ:SPURious:SPECtrum:X? (on page 1878)

Arguments

None

Returns

#<num_digit><num_byte><y(1)><y(2)>...<y(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<y(n)> is the amplitude (dBm) at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:SPURIOUS:SPECTRUM:Y might return #516020xxxx... (16020-byte data) for the amplitudes of the spectrum trace in the Spurious measurement.

READ:SPURious:SPUR<x>:AMPLitude:ABSolute? (Query Only)

Returns the absolute amplitude of the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:AMPLitude:ABSolute?

Arguments

None

Returns

<NRf> Absolute amplitude of the specified spurious in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs (on page 2319) command.

Examples

READ:SPURIOUS:SPUR1:AMPLITUDE:ABSOLUTE? might return -19.782, indicating that the absolute amplitude of Spurious #1 is -19.782 dBm.

READ:SPURious:SPUR<x>:AMPLitude:RELative? (Query Only)

Returns the relative amplitude of the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:AMPLitude:RELative?

Arguments

None

Returns

<NRf> Relative amplitude of the specified spurious signal in dB.

Use the [SENSe]:SPURious:REFerence (on page 2460) command to set the power reference.

Examples

READ:SPURIOUS:SPUR1:AMPLITUDE:RELATIVE? might return -9.782, indicating that the relative amplitude of Spurious #1 is -9.782 dB.

READ:SPURious:SPUR<x>:FREQuency:ABSolute? (Query Only)

Returns the absolute frequency of the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:FREQuency:ABSolute?

Arguments

None

Returns

<NRf> Absolute frequency of the spurious signal in Hz.

Examples

READ:SPURIOUS:SPUR1:FREQUENCY:ABSOLUTE? might return 2.235E+9, indicating that the absolute frequency of Spurious #1 is 2.235 GHz.

READ:SPURious:SPUR<x>:FREQuency:RELative? (Query Only)

Returns the relative frequency of the specified spurious signal to the carrier in the Spurious measurement. This command is valid when [SENSe]:SPURious:REFerence is set to CARRier.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:FREQuency:RELative?

Arguments

None

Returns

<NRf> Relative frequency of the spurious signal to the carrier in Hz.

Examples

READ:SPURIOUS:SPUR1:FREQUENCY:RELATIVE? might return 3.634E+6, indicating that the relative frequency of Spurious #1 is 3.634 MHz.

READ:SPURious:SPUR<x>:LIMit:ABSolute? (Query Only)

Returns the absolute amplitude of the limit for the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:LIMit:ABSolute?

Arguments

None

Returns

<NRf> Absolute amplitude of the limit for the specified spurious signal in dBm.

The unit can be changed by the [SENSe]:POWer:UNITs command.

Examples

READ:SPURIOUS:SPUR1:LIMIT:ABSOLUTE? might return -50.0, indicating that the absolute amplitude of the limit for Spurious #1 is -50 dBm.

READ:SPURious:SPUR<x>:LIMit:RELative? (Query Only)

Returns the relative amplitude of the limit for the specified spurious signal in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:LIMit:RELative?

Arguments

None

Returns

<NRf> Relative amplitude of the limit for the specified spurious signal in dB.

Use the [SENSe]:SPURious:REFerence (on page 2460) command to set the power reference.

Examples

READ:SPURIOUS:SPUR1:LIMIT:RELATIVE? might return -10.0, indicating that the relative amplitude of the limit for Spurious #1 is -10 dB.

READ:SPURious:SPUR<x>:LIMit:VIOLation? (Query Only)

Returns whether the specified spurious signal exceeds the limit or not.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:LIMit:VIOLation?

Arguments

None

Returns

0 (under the limit) or 1 (over the limit).

Examples

READ:SPURIOUS:SPUR1:LIMIT:VIOLATION? might return 1, indicating that Spurious #1 exceeds the limit.

READ:SPURious:SPUR<x>:RANGe? (Query Only)

Returns the frequency range in which the specified spurious signal occurred.

Conditions

Measurement views: Spurious

Group

Read commands

Syntax

READ:SPURious:SPUR<x>:RANGe?

Arguments

None

Returns

<string> "A" to "T" representing Range A to T, respectively.

Examples

READ:SPURIOUS:SPUR1:RANGE? might return "E", indicating that Spurious #1 is in Range E.

READ:SQUality[:MEASview<y>]:FREQuency:DEViation? (Query only)

Returns the frequency deviation in the signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to C4FM, FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:FREQuency:DEViation?

Arguments

None

Returns

<NRf> Frequency deviation in Hz.

Examples

READ:SQUality:MEASview1:FREQuency:DEViation? might return 12.68E+3, indicating the frequency deviation is 12.68 kHz for measurement view 1.

READ:SQUality[:MEASview<y>]:FREQuency:DEViation:TABLe? (Query only)

Returns the number of columns and the values in the frequency deviation table for a signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to C4FM, FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:FREQuency:DEViation:TABLe?

Arguments

None

Returns

<Dev_Num>,{<Freq_dev_Max>,<Freq_dev_Min>,<Freq_dev_Avg>}

Where

`<Dev_Num>::<NR1>` is the number of columns in the frequency deviation table.

= 2 (2FSK), 4 (4FSK, C4FM), 8 (8FSK), or 16 (16FSK)

`<Freq_dev_Max>::<NRf>` is the maximum frequency deviation in Hz.

`<Freq_dev_Min>::<NRf>` is the minimum frequency deviation in Hz.

`<Freq_dev_Avg>::<NRf>` is the average frequency deviation in Hz.

The dataset `<Freq_dev_Max>,<Freq_dev_Min>,<Freq_dev_Avg>` is returned for each symbol in ascending order of its level (for example, in order of symbol -3, -1, +1, and +3 for 4FSK).

Examples

`READ:SQUality:MEASview1:FREQuency:DEViation:TABLe?` might return 2,1.257E+3,1.039E+3,1.162E+3,1.586E+3,1.298E+3,1.425E+3 for the frequency signal, populating the results table as follows.

Deviations	-1	+1
Maximum	1.257 kHz	1.586 kHz
Average	1.162 kHz	1.425 kHz
Minimum	1.039 kHz	1.298 kHz

READ:SQUality[:MEASview<y>]:FREQuency:ERRor? (Query only)

Returns the frequency error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:FREQuency:ERRor?`

Arguments

None

Returns

<NRf> Frequency error in Hz.

Examples

READ:SQUality:MEASview1:FREQuency:ERRor? might return 612.043E+3, indicating that the frequency error is 612.043 kHz for measurement view 1.

READ:SQUality[:MEASview<y>]:GAIN:IMBalance? (Query only)

Returns the gain imbalance in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:GAIN:IMBalance?

Arguments

None

Returns

<NRf> Gain imbalance in dB.

Examples

READ:SQUality:MEASview1:GAIN:IMBalance? might return -57.746E-3, indicating that the gain imbalance is -0.057746 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:ORIGin:OFFSet? (Query only)

Returns the origin offset in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:ORIGin:OFFSet?

Arguments

None

Returns

<NRf> Origin offset in dB.

Examples

READ:SQUality:MEASview1:ORIGin:OFFSet? might return -44.968, indicating that the origin offset is -44.968 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:EVM? (Query only)

Returns the peak EVM (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:PEAK:EVM?

Arguments

None

Returns

<NRf> Peak EVM in percent (%).

Examples

READ:SQUality:MEASview1:PEAK:EVM? might return 4.276, indicating that the peak EVM is 4.276% for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:EVM:DB? (Query only)

Returns the peak EVM (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:EVM:DB?`

Arguments

None

Returns

`<NRf>` Peak EVM in dB.

Examples

`READ:SQUality:MEASview1:PEAK:EVM:DB?` might return -27.358, indicating that the peak EVM is -27.358 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:EVM:DB:OFFSet? (Query only)

Returns the peak offset EVM (dB) in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:EVM:DB:OFFSet?`

Arguments

None

Returns

`<NRf>` Peak offset EVM in dB.

Examples

`READ:SQUality:MEASview1:PEAK:EVM:DB:OFFSet?` might return `-37.624`, indicating the peak offset EVM is –37.624 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:EVM:LOCation? (Query only)

Returns the time at which the EVM is peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:EVM:LOCation?`

Arguments

None

Returns

`<NRf>` The time in symbol number at which the EVM is peak.

The unit can be changed by the `[SENSe]:DDEMod:TIMe:UNITs` command.

Examples

`READ:SQUality:MEASview1:PEAK:EVM:LOCation?` might return 68.000, indicating that the EVM is peak at symbol #68.000 for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:EVM:LOCation:OFFSet? (Query only)

Returns the time at which the offset EVM is peak.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:EVM:LOCation:OFFSet?`

Arguments

None

Returns

<NRf> The time in symbol number at which the offset EVM is peak.

The unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

READ:SQUality:MEASview1:PEAK:EVM:LOCation:OFFSet? might return 123.00, indicating that the offset EVM is peak at symbol #123 for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:EVM:OFFSet? (Query only)

Returns the peak offset EVM (%) in the signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:PEAK:EVM:OFFSet?

Arguments

None

Returns

<NRf> Peak offset EVM in percent (%).

Examples

READ:SQUality:MEASview1:PEAK:EVM:OFFSet? might return 1.298, indicating the peak offset EVM is 1.298% for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:FERRor? (Query only)

Returns the peak FSK error in the signal quality measurement.

This command is valid when [SENSe]:DDEMod:MODulation:TYPE is set to FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:FERRor?`

Arguments

None

Returns

`<NRf>` Peak FSK error in percent (%).

Examples

`READ:SQUality:MEASview1:PEAK:FERRor?` might return 9.136, indicating the peak FSK error is 9.136% for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:MERRor? (Query only)

Returns the peak magnitude error (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:MERRor?`

Arguments

None

Returns

`<NRf>` Peak magnitude error in percent (%).

Examples

`READ:SQUality:MEASview1:PEAK:MERRor?` might return 3.595, indicating that the peak magnitude error is 3.595% for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:MERRor:DB? (Query only)

Returns the peak magnitude error (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:MERRor:DB?`

Arguments

None

Returns

`<NRf>` Peak magnitude error in dB.

Examples

`READ:SQUality:MEASview1:PEAK:MERRor:DB?` might return -28.583, indicating that the magnitude error is -28.583 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:MERRor:LOCation? (Query only)

Returns the time at which the magnitude error is peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:MERRor:LOCation?`

Arguments

None

Returns

`<NRf>` The time in symbol number at which the magnitude error is peak.

The unit can be changed by the `[SENSe]:DDEMod:TIMe:UNITs` command.

Examples

`READ:SQUality:MEASview1:PEAK:MERRor:LOCation?` might return 68.000, indicating that the magnitude error is peak at symbol #68 for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:PERRor? (Query only)

Returns the peak phase error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:PERRor?`

Arguments

None

Returns

`<NRf>` Peak phase error in degrees.

Examples

`READ:SQUality:MEASview1:PEAK:PERRor?` might return 1.907, indicating that the peak phase error is 1.907 ° for measurement view 1.

READ:SQUality[:MEASview<y>]:PEAK:PERRor:LOCation? (Query only)

Returns the time at which the phase error is peak.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:PEAK:PERRor:LOCation?`

Arguments

None

Returns

<NRf> The time in symbol number at which the phase error is peak.

The unit can be changed by the [SENSe]:DDEMod:TIMe:UNITs command.

Examples

READ:SQUality:MEASview1:PEAK:PERRor:LOCation? might return 68.000, indicating that the phase error is peak at symbol #68 for measurement view 1.

READ:SQUality[:MEASview<y>]:QUADrature:ERRor? (Query only)

Returns the quadrature error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:QUADrature:ERRor?

Arguments

None

Returns

<NRf> Quadrature error in degrees.

Examples

READ:SQUality:MEASview1:QUADrature:ERRor? might return -14.264E-3, indicating that the quadrature error is -0.014264° for measurement view 1.

READ:SQUality[:MEASview<y>]:RHO? (Query only)

Returns the ρ (waveform quality) value in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:RHO?

Arguments

None

Returns

<NRf> ρ value.

Examples

READ:SQUality:MEASview1:RHO? might return 998.703E-3, indicating that ρ is 0.998703 for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:EVM? (Query only)

Returns the RMS EVM (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:RMS:EVM?

Arguments

None

Returns

<NRf> RMS EVM in percent (%).

Examples

READ:SQUality:MEASview1:RMS:EVM? might return 2.417, indicating that the RMS EVM is 2.417% for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:EVM:DB? (Query only)

Returns the RMS EVM (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:RMS:EVM:DB?`

Arguments

None

Returns

`<NRf>` RMS EVM in dB.

Examples

`READ:SQUality:MEASview1:RMS:EVM:DB?` might return -32.356, indicating that the RMS EVM is -32.356 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:EVM:DB:OFFSet? (Query only)

Returns the RMS offset EVM (dB) in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:RMS:EVM:DB:OFFSet?`

Arguments

None

Returns

`<NRf>` RMS offset EVM in dB.

Examples

`READ:SQUality:MEASview1:RMS:EVM:DB:OFFSet?` might return `-41.276`, indicating the RMS offset EVM is -41.276 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:EVM:OFFSet? (Query only)

Returns the RMS offset EVM (%) in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to OQPSK or SOQPSK.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:RMS:EVM:OFFSet?`

Arguments

None

Returns

`<NRf>` RMS offset EVM in percent (%).

Examples

`READ:SQUality:MEASview1:RMS:EVM:OFFSet?` might return 0.783, indicating the RMS offset EVM is 0.783% for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:FERRor? (Query only)

Returns the RMS FSK error in the signal quality measurement.

This command is valid when `[SENSe]:DDEMod:MODulation:TYPE` is set to FSK2, FSK4, FSK8, or FSK16.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:RMS:FERRor?`

Arguments

None

Returns

`<NRf>` RMS FSK error in percent (%).

Examples

`READ:SQUality:MEASview1:RMS:FERRor?` might return 8.67, indicating the RMS FSK error is 8.67% for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:MER:DB? (Query only)

Returns the RMS MER (Modulation Error Ratio) in dB in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:RMS:MER:DB?`

Arguments

None

Returns

`<NRf>` RMS MER in dB.

Examples

`READ:SQUality:MEASview1:RMS:MER:DB?` might return 27.394, indicating that the RMS MER is 27.394 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:MERRor? (Query only)

Returns the RMS magnitude error (%) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:RMS:MERRor?`

Arguments

None

Returns

<NRf> RMS magnitude error in percent (%).

Examples

READ:SQUality:MEASview1:RMS:MERRor? might return 1.837, indicating that the RMS magnitude error is 1.837% for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:MERRor:DB? (Query only)

Returns the RMS magnitude error (dB) in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:RMS:MERRor:DB?

Arguments

None

Returns

<NRf> RMS magnitude error in dB.

Examples

READ:SQUality:MEASview1:RMS:MERRor:DB? might return -34.706, indicating that the magnitude error is -34.706 dB for measurement view 1.

READ:SQUality[:MEASview<y>]:RMS:PERRor? (Query only)

Returns the RMS phase error in the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:RMS:PERRor?

Arguments

None

Returns

<NRf> RMS phase error in degrees.

Examples

READ:SQUality:MEASview1:RMS:PERRor? might return 893.472E-3, indicating that the RMS phase error is 0.893472° for measurement view 1.

READ:SQUality[:MEASview<y>]:SYMBol:LENGth? (Query only)

Returns the number of analyzed symbols.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Read commands

Syntax

READ:SQUality[:MEASview<y>]:SYMBol:LENGth?

Related Commands

Returns

<NR1> indicates the length of the synch word in symbols.

Examples

READ:SQUality:MEASview1:SYMBol:LENGth? might return 3, indicating the length is three symbols for measurement view 1.

READ:SQUality[:MEASview<y>]:SYMBol:RATE? (Query only)

Returns the value of the calculated symbol rate in Hz.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

It is valid when the modulation type is 2|4|8|16FSK and [:SENSe]:DDEMod:SYMBol:RATE:SEARch is ON.

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:SYMBol:RATE?`

Related Commands

[SENSe]:DDEMod:SYMBol:RATE:SEARch (on page 2097)

Returns

`<NRf>` is the calculated symbol rate in Hz.

Examples

`READ:SQUality:MEASview1:SYMBol:RATE?` might return 95.24E+3, indicating the calculated symbol rate is 95.24 kHz for measurement view 1.

READ:SQUality[:MEASview<y>]:SYMBol:RATE:ERRor? (Query only)

Returns the value of the symbol rate error in percent (%).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

It is valid when the modulation type is 2|4|8|16FSK and `[:SENSe]:DDEMod:SYMBol:RATE:SEARch` is ON.

Group

Read commands

Syntax

`READ:SQUality[:MEASview<y>]:SYMBol:RATE:ERRor?`

Related Commands

[SENSe]:DDEMod:SYMBol:RATE:SEARch (on page 2097)

Returns

`<NRf>` is the symbol error percent (%).

Examples

`READ:SQUality:MEASview1:SYMBol:RATE:ERRor?` might return -0.002, indicating that the symbol rate error is -0.002% for measurement view 1.

READ:TDIagram[:MEASview<y>]:FERRor? (Query only)

Returns the frequency error in the Trellis diagram measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Trellis diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Trellis diagram).

Group

Read commands

Syntax

`READ:TDIagram[:MEASview<y>]:FERRor?`

Arguments

None

Returns

`<freq_error>::<NRf>` is the frequency error in Hz.

Examples

`READ:TDIagram:MEASview2:FERROR?` might return -10.7E+3, indicating the frequency error is -10.7 kHz.

READ:TDIagram[:MEASview<y>]:TRACe? (Query only)

Returns the Trellis diagram trace data.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Trellis diagram

Group

Read commands

Syntax

`READ:TDIagram[:MEASview<y>]:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><Y(1)><X(1)><Y(2)><X(2)>...<Y(n)><X(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<Y(n)>` and `<X(n)>` is the phase in degrees and the time in symbols pair at the n^{th} data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:TDIagram:MEASview2:TRACe?` might return #3160xxxx... (160-byte data) for the frequency deviation versus Time trace.

READ:TOVerview[:MEASview<y>](Query Only)

Returns the trace data in the time overview.

Conditions

Measurement views: Time overview with specified Measurement view number

Group

Read commands

Syntax

`READ:TOVerview[:MEASview<y>]`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the trace data in dBm for the point n, 4-byte little endian floating-point format specified in IEEE 488.2.

The unit can be changed by the `[SENSe]:POWer:UNITs` command.

Examples

`READ:TOVerview:MEASview1?` might return `#43204xxxx...` (3204-byte data) for the trace in the time overview.

READ:WLAN:AD:CONSte:DATA:EVM? (Query Only)

Queries the EVM value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Read commands

Syntax

`READ:WLAN:AD:CONSte:DATA:EVM?`

Arguments

None

Returns

`<NRf>` = EVM value

Examples

`READ:WLAN:AD:CONSTE:DATA:EVM?` might return `-42.482`, indicating the EVM value present in the analysis data is -42.482 dB.

READ:WLAN:AD:CONSte:DATA:EVM:PEAK? (Query Only)

Queries the EVM Peak value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Read commands

Syntax

`READ:WLAN:AD:CONSte:DATA:EVM:PEAK?`

Arguments

None

Returns

`<NRf>` = EVM peak value

Examples

`READ:WLAN:AD:CONSTE:DATA:EVM:PEAK?` might return `-35.325`, indicating the EVM Peak value is –35.325 dB.

READ:WLAN:AD:CONSte:DATA:EVM:PEAK:SYMBol? (Query Only)

Queries the EVM peak symbol value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Read commands

Syntax

`READ:WLAN:AD:CONSte:DATA:EVM:PEAK:SYMBol?`

Arguments

None

Returns

`<NRf>` = Symbol value

Examples

`READ:WLAN:AD:CONSTE:DATA:EVM:PEAK:SYMBOL?` might return `6.312`, indicating the EVM peak symbol value is 6.312.

READ:WLAN:AD:CONSte:FERRor? (Query Only)

Queries the frequency Error value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Read commands

Syntax

`READ:WLAN:AD:CONSte:FERRor?`

Arguments

None

Returns

`<NR3>` = frequency error

Examples

`READ:WLAN:AD:CONSTE:FERROR?` might return `3.344+3`, indicating the frequency error value is 3.344 kHz.

READ:WLAN:AD:CONSte:IQDC:OFFSet? (Query Only)

Queries IQ Origin Offset value in Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Read commands

Syntax

`READ:WLAN:AD:CONSte:IQDC:OFFSet?`

Arguments

None

Returns

`<NRf>` = IQ Origin offset value

Examples

`READ:WLAN:AD:CONSTE:IQDC:OFFSET?` might return `-51.841`, indicating the IQ Origin Offset value is –51.841 dB.

READ:WLAN:AD:EVM:TRACe? (Query Only)

Returns the EVM versus time trace data.

Conditions

Measurement views: 802.11ad EVM vs Time

Group

Read commands

Syntax

`READ:WLAN:AD:EVM:TRACe?`

Arguments

None

Returns

`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the EVM value at the nth data point in percent (%), `<data(n)>` follows 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:AD:EVM:TRACE?` might return `#42036xxxx...` (2036-byte data), indicating the EVM versus time trace data.

READ:WLAN:AD:SUMMary:AVERage:BURSt:COUNt (Query Only)

Returns the current burst number out of the total burst in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:AVERage:BURSt:COUNt?`

Arguments

None

Returns

`<NR1>`

Examples

`READ:WLAN:AD:SUMMARY:AVERAGE:BURST:COUNT?` might return `1`, indicating the current burst count is 1 out of the total burst.

READ:WLAN:AD:SUMMary:AVERage:BURSt:TOTAl:COUNt (Query Only)

Returns the total burst count to be averaged in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

```
READ:WLAN:AD:SUMMary:AVERage:BURSt:TOTAl:COUNt?
```

Arguments

None

Returns

<NR1>

Examples

READ:WLAN:AD:SUMMARY:AVERAGE:BURST:TOTAL:COUNT? might return 1, indicating the total burst count to be averaged is 1.

READ:WLAN:AD:SUMMary:ESNR (Query Only)

Returns the value of estimated SNR value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AD:SUMMary:ESNR?
```

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:ESNR? might return 36.856, indicating the estimated SNR value is 36.856 dB.

READ:WLAN:AD:SUMMary:EVM:DATA:AVERage (Query Only)

Returns Avg EVM (Data) value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:DATA:AVERage?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:DATA:AVERAGE` might return `-40.7035275551`, indicating that the Avg EVM (Data) value is −40.70 dB.

READ:WLAN:AD:SUMMary:EVM:DATA:AVERage:STATus (Query Only)

Returns Avg EVM (Data) status in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:DATA:AVERage:STATus?`

Arguments

None

Returns

`<String>`

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not applicable.

Examples

`READ:WLAN:AD:SUMMARY:EVM:DATA:AVERAGE:STATUS?` might return `PASS`, indicating that the Avg EVM (Data) test has passed.

READ:WLAN:AD:SUMMary:EVM:DATA:MAX (Query Only)

Returns Max EVM (Data) value in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax
`READ:WLAN:AD:SUMMary:EVM:DATA:MAX?`

Arguments
None

Returns
`<NRf>`

Examples
`READ:WLAN:AD:SUMMARY:EVM:DATA:MAX?` might return `922.1968241036E-3`, indicating the Max EVM (Data) value is 922.19 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:CEF:EVM (Query Only)
Returns the EVM value in the CEF region of the packet in the 802.11ad Summary display.

Conditions
Measurement view: 802.11ad Summary

Group
Read commands

Syntax
`READ:WLAN:AD:SUMMary:EVM:PACKet:CEF:EVM?`

Arguments
None

Returns
`<NRf>`

Examples
`READ:WLAN:AD:SUMMARY:EVM:PACKET:CEF:EVM?` might return `6.9680400193`, indicating the EVM value in the CEF region of the packet is 6.69 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:CEF:PEAK (Query Only)
Returns the peak Error occurred at the given Symbol in CEF Packet in 802.11ad Summary display.

Conditions
Measurement view: 802.11ad Summary

Group
Read commands

Syntax
`READ:WLAN:AD:SUMMary:EVM:PACKet:CEF:PEAK?`

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:EVM:PACKET:CEF:PEAK might return 13.7763872743, indicating the peak error value at the given symbol in CEF region of the packet is 13.77 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:CEF:SYMBol (Query Only)

Returns the symbol at which the peak error occurred in the CEF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:EVM:PACKet:CEF:SYMBol?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:EVM:PACKET:CEF:SYMBOL might return 7.4020000000E+3, indicating the peak error occurred at symbol 7.40 in the CEF region of the packet.

READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:EVM (Query Only)

Returns the EVM value in Data region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:EVM?

Arguments

None

Returns

<NRf>

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:DATA:EVM` might return `-33.5668742100`, indicating EVM value in Data region of the packet is -33.56 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:PEAK (Query Only)

Returns the peak Error occurred at the given Symbol in Data Packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:PEAK?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:DATA:PEAK?` might return `-26.5964736883`, indicating Peak Error value at given Symbol in Data packet is -26.59 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:STATus (Query Only)

Returns the status of the Data packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:STATus?`

Arguments

None

Returns

`<String>`

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not Applicable

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:DATA:STATUS?` might return `Pass`, indicating that the Data packet test result has Passed.

READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:SYMBol (Query Only)

Returns the symbol at which the peak Error occurred in the DATA region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:DATA:SYMBol?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:DATA:SYMBOL` might return `4.6610000000E+3`, indicating at 4.66 symbol, peak error occurred in Data Region of the packet.

READ:WLAN:AD:SUMMary:EVM:PACKet:GUARd:EVM (Query Only)

Returns the EVM value in the Guard region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:GUARd:EVM?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:GUARD:EVM` might return `-65.4983500315`, indicating the EVM value in the Guard region of the packet is –65.49 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:GUARd:PEAK (Query Only)

Returns the peak error occurred at the given symbol in Guard packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:GUARd:PEAK?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:GUARD:PEAK` might return `-26.5964736883`, indicating the peak error value at the given symbol in the Guard packet is −26.59 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:GUARd:SYMBol (Query Only)

Returns the symbol at which the peak error occurred in the Guard region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:GUARd:SYMBol?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:GUARD:SYMBOL` might return `3.3340000000E+3`, indicating the peak error occurred at symbol 3.33 in the Guard region of the packet.

READ:WLAN:AD:SUMMary:EVM:PACKet:HEADer:EVM (Query Only)

Returns the EVM value in the Header region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:HEADer:EVM?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:HEADER:EVM` might return `-67.1981081169`, indicating the EVM value in the Header region of the packet is –67.19 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:HEADer:PEAK (Query Only)

Returns the peak error occurred at the given symbol in the Header packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:EVM:PACKet:HEADer:PEAK?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:EVM:PACKET:HEADER:PEAK` might return `-60.9603086224`, indicating the peak error value at the given symbol in the Header region of the packet is –60.9603086224 .

READ:WLAN:AD:SUMMary:EVM:PACKet:HEADer:SYMBol (Query Only)

Returns the symbol at which the peak error occurred in the Header region of the packet in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

```
READ:WLAN:AD:SUMMary:EVM:PACKet:HEADer:SYMBol?
```

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:EVM:PACKET:HEADER:SYMBOL might return 3.3970000000E+3, indicating the peak error occurred at symbol 3.39 in the Header region of the packet.

READ:WLAN:AD:SUMMary:EVM:PACKet:STF:EVM (Query Only)

Returns the EVM value in STF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

```
READ:WLAN:AD:SUMMary:EVM:PACKet:STF:EVM?
```

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:EVM:PACKET:STF:EVM might return -22.9729890175, indicating the EVM value in the STF region of the packet is -22.97 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:STF:PEAK (Query Only)

Returns the peak error at the given symbol in the STF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:EVM:PACKet:STF:PEAK?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:EVM:PACKET:STF:PEAK might return 38.8123661280, indicating the peak error at the given symbol in the STF packet is 38.81 dB.

READ:WLAN:AD:SUMMary:EVM:PACKet:STF:SYMBol (Query Only)

Returns the symbol at which the peak error occurred in the STF region of the packet in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:EVM:PACKet:STF:SYMBol?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:EVM:PACKET:STF:SYMBOL might return 0.0000, indicating the peak error occurred at symbol 0.0000 in the STF region of the packet.

READ:WLAN:AD:SUMMary:FERRor:AVERage (Query Only)

Returns the Avg Frequency Error value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:FERRor:AVERage?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:FERROR:AVERAGE might return -114.1332879317E-3, indicating the Avg Frequency Error value is -114.1332879317E-3 ppm.

READ:WLAN:AD:SUMMary:FERRor:AVERage:STATus (Query Only)

Returns the Avg Frequency Error status in the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:FERRor:AVERage:STATus?

Arguments

None

Returns

<String>

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not applicable.

Examples

READ:WLAN:AD:SUMMARY:FERROR:AVERAGE:STATUS? might return PASS, indicating that the Avg Frequency Error test has passed.

READ:WLAN:AD:SUMMary:FERRor:HERTz (Query Only)

Returns the Frequency Error value in 802.11ad Summary Display in Hz.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:FERRor:HERTz?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:FERROR:HERTZ might return 2.875E+3, indicating the Frequency Error value is 2.875E+3 Hz.

READ:WLAN:AD:SUMMary:FERRor:MAX (Query Only)

Returns Max Frequency Error value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:FERRor:MAX?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:FERROR:MAX might return -114.1332879317E-3, indicating the maximum frequency error is -14.1332879317E-3 ppm.

READ:WLAN:AD:SUMMary:FERRor:PPM (Query Only)

Returns the Frequency Error value in 802.11ad Summary display in ppm.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:FERRor:PPM?

Arguments

None

Returns

<NRf>

Examples

`READ:WLAN:AD:SUMMARY:FERROR:PPM` might return `575.023E-3`, indicating the Frequency Error value is 575.023E-3 ppm.

READ:WLAN:AD:SUMMary:FERRor:STATus (Query Only)

Returns the Frequency Error Status in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:FERRor:STATus?`

Arguments

None

Returns

`<String>`

PASS indicates that the test passed.

FAIL indicates that the test failed.

NA indicates that the test is not applicable.

Examples

`READ:WLAN:AD:SUMMARY:FERROR:STATUS?` might return `PASS`, indicating that the Frequency Error test has passed.

READ:WLAN:AD:SUMMary:IQ:GAIN:IMBALance (Query Only)

Returns IQ Gain Imbalance value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:IQ:GAIN:IMBALance?`

Arguments

None

Returns

`<NRf>`

Examples

READ:WLAN:AD:SUMMARY:IQ:GAIN:IMBALANCE might return 69.2700818181E-3, indicating IQ Gain Imbalance value is 69.2700818181E-3 % .

READ:WLAN:AD:SUMMary:IQ:ORIGin:OFFSet (Query Only)

Returns IQ Origin Offset value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:IQ:ORIGin:OFFSet?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:IQ:ORIGIN:OFFSET might return −160.0000000000, indicating that the IQ Origin Offset value is −160 dB.

READ:WLAN:AD:SUMMary:IQ:QUADrature:ERROr (Query Only)

Returns IQ Quadrature Error value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:IQ:QUADrature:ERROr?

Arguments

None

Returns

<NRf>

Examples

READ:WLAN:AD:SUMMARY:IQ:QUADRATURE:ERROR? might return −220.5967903137E-3, indicating IQ Quadrature Error value is −220.5967903137E-3 degrees.

READ:WLAN:AD:SUMMary:PACKet:AGGRegation (Query Only)

Returns the value of Aggregation packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:AGGRegation?`

Arguments

None

Returns

`<Boolean> 0, 1`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:AGGREGATION?` might return `"0"`, indicating the Aggregation value is "0".

READ:WLAN:AD:SUMMary:PACKet:BTR (Query Only)

Returns the value of Beam Tracking Request packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:BTR?`

Arguments

None

Returns

`<Boolean> 0, 1`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:BTR` might return `"0"`, indicating the Beam Tracking Request value.

READ:WLAN:AD:SUMMary:PACKet:HCS (Query Only)

Returns the value of HCS packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:HCS?`

Arguments

None

Returns

`<String>`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:HCS` might return `"1001010000001000"`, indicating the HCS value.

READ:WLAN:AD:SUMMary:PACKet:LENGth (Query Only)

Returns the value of Length packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:LENGth?`

Arguments

None

Returns

`<String>`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:LENGTH` might return `"1000"`, indicating the Length value is "1000".

READ:WLAN:AD:SUMMary:PACKet:MCS (Query Only)

Returns the value of MCS packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:PACKet:MCS?

Arguments

None

Returns

<NR1> Range is 0 to 12

Examples

READ:WLAN:AD:SUMMARY:PACKET:MCS might return 5, indicating the MCS value is 5.

READ:WLAN:AD:SUMMary:PACKet:PPDU (Query Only)

Returns the value of Additional PPDU packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:PACKet:PPDU?

Arguments

None

Returns

<Boolean> 0,1

Examples

READ:WLAN:AD:SUMMARY:PACKET:PPDU might return "0", indicating the Additional PPDU value is "0".

READ:WLAN:AD:SUMMary:PACKet:RSSI (Query Only)

Returns the value of last RSSI packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

READ:WLAN:AD:SUMMary:PACKet:RSSI?

Arguments

None

Returns

<String>

Examples

`READ:WLAN:AD:SUMMARY:PACKET:RSSI` might return `"0000"`, indicating the last RSSI value.

READ:WLAN:AD:SUMMary:PACKet:SCRAmbler:INITialization (Query Only)

Returns the value of Scrambler initialization packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:SCRAmbler:INITialization?`

Arguments

None

Returns

`<String>`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:SCRAMBLER:INITIALIZATION` might return "0101110", indicating the Scrambler Initialization value is "0101110".

READ:WLAN:AD:SUMMary:PACKet:TAROUND (Query Only)

Returns the value of Turnaround packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:TAROUND?`

Arguments

None

Returns

`<Boolean>` 0,1

Examples

`READ:WLAN:AD:SUMMARY:PACKET:TAROUND` might return `"1"`, indicating the Turnaround value.

READ:WLAN:AD:SUMMary:PACKet:TLEN (Query Only)

Returns the value of Training Length packet information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:TLEN?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:TLEN` might return `21`, indicating the value of Training Length packet is 21.

READ:WLAN:AD:SUMMary:PACKet:TYPE (Query Only)

Returns the value of Packet Type information in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:PACKet:TYPE?`

Arguments

None

Returns

`<Boolean> 0,1`

Examples

`READ:WLAN:AD:SUMMARY:PACKET:TYPE` might return `"0"`, indicating the Packet Type value is "0".

READ:WLAN:AD:SUMMary:RCPI (Query Only)

Returns the RCPI value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:RCPI?`

Arguments

None

Returns

`<NR1>`

Examples

`READ:WLAN:AD:SUMMARY:RCPI` might return `207.0000000000`, indicating the RCPI value is 207.

READ:WLAN:AD:SUMMary:RF:POWer (Query Only)

Queries the RF Output Power value in 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Read commands

Syntax

`READ:WLAN:AD:SUMMary:RF:POWer?`

Arguments

None

Returns

`<NRf>`

Examples

`READ:WLAN:AD:SUMMARY:RF:POWER` might return `-6.3434391022`, indicating the RF Output Power is -6.3434391022 dBm.

READ:WLAN:AY:CONSte:DATA:EVM? (Query Only)

Query the maximum EVM value present in the analysis data in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Read commands

Syntax
`READ:WLAN:AY:CONSte:DATA:EVM?`

Returns
`<NRf>`

Units: dB

Examples
`READ:WLAN:AY:CONS:FREQ:ERRO?` may return `-42.482`, which indicates that the maximum EVM value is -42.482 dB.

READ:WLAN:AY:CONSte:DATA:EVM:PEAK? (Query Only)
Query the Data Peak Error value in the Constellation display.

Conditions
Measurement view: 802.11ay Analysis Constellation

Group
Read commands

Syntax
`READ:WLAN:AY:CONSte:DATA:EVM:PEAK?`

Returns
`<NRf>`

Units: dB

Examples
`READ:WLAN:AY:CONS:DATA:EVM:PEAK?` may return `-35.325`, which indicates that the Data Peak Error value is -35.325 dB.

READ:WLAN:AY:CONSte:DATA:EVM:PEAK:SYMBol? (Query Only)
Query the maximum EVM value at the given Symbol in the Constellation display.

Conditions
Measurement view: 802.11ay Analysis Constellation

Group
Read commands

Syntax
`READ:WLAN:AY:CONSte:DATA:EVM:PEAK:SYMBol?`

Returns
`<NRf>`

Examples
`READ:WLAN:AY:CONS:DATA:EVM:PEAK:SYMB?` may return `3.327e+003`, which is the maximum EVM value at the 3327 Symbol.

READ:WLAN:AY:CONSte:FERRor? (Query Only)

Query the Frequency Error value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Read commands

Syntax

`READ:WLAN:AY:CONSte:FERRor?`

Returns

`<NRf>`

Units: Hz

Examples

`READ:WLAN:AY:CONS:FERR?` may return `-51.841`, which indicates that the Frequency Error value is -51.841 Hz.

READ:WLAN:AY:CONSte:FREQuency:ERROr? (Query Only)

Query the Frequency Error value in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Read commands

Syntax

`READ:WLAN:AY:CONSte:FREQuency:ERROr?`

Returns

`<NRf>`

Units: Hz

Examples

`READ:WLAN:AY:CONS:FREQ:ERRO?` may return `0.0000`, which indicates that the Frequency Error value is 0.0000 Hz.

READ:WLAN:AY:CONSte:IQDC:OFFSet? (Query Only)

Query the IQ Origin Offset value in the Constellation display in dB.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Read commands

Syntax
`READ:WLAN:AY:CONSte:IQDC:OFFSet?`

Returns
`<NRf>`

Examples
`READ:WLAN:AY:CONS:IQDC:OFFS?` may return `-51.841`, which indicates that the IQ Origin Offset value is -51.841 dB.

READ:WLAN:AY:EVM:TRACe? (Query Only)
Query the EVM versus time trace data after performing a single run.

NOTE: The instrument must be connected.

Conditions
Measurement views: 802.11ay Analysis EVM

Group
Read commands

Syntax
`READ:WLAN:AY:EVM:TRACe?`

Returns
`#<num_digit><num_byte><data(1)><data(2)>...<data(n)>`

where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the EVM value at the nth data point in percentage (%).

`<data(n)>` follows 4-byte little endian floating point format specified in IEEE 488.2.

Examples
`READ:WLAN:AY:EVM:TRAC?` may return #42036xxxx...(2036-byte data) for the EVM versus time trace.

READ:WLAN:AY:SUMMary:AVERage:BURSt:COUNt? (Query Only)
Query the current Burst Count in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:AVERage:BURSt:COUNt?`

Returns

<NR1>

Examples

READ:WLAN:AY:SUMM:AVER:BURS:COUN? may return 1, which indicates that the current Burst Count is 1.

READ:WLAN:AY:SUMMary:AVERage:BURSt:TOTAl:COUNt? (Query Only)

Query the Total Burst Count to be averaged.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:AVERage:BURSt:TOTAl:COUNt?

Returns

<NR1>

Examples

READ:WLAN:AY:SUMM:AVER:BURS:TOTA:COUN? may return 1, which indicates that the Total Burst Count to be averaged is 1.

READ:WLAN:AY:SUMMary:ESNR? (Query Only)

Query the Estimated SNR (Signal-to-Noise Ratio) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:ESNR?

Returns

<NRf>

Units: dB

Examples

READ:WLAN:AY:SUMM:ESNR? may return 34.50, which indicates that the Estimated SNR value is 34.50 dB.

READ:WLAN:AY:SUMMary:EVM:DATA:AVERage? (Query Only)

Query the Average EVM (Data) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:DATA:AVERage?`

Returns

`<NRf>`

Units: dB or % (based on the selected EVM unit)

Examples

`READ:WLAN:AY:SUMM:EVM:DATA:AVER?` may return `-40.7035275551`, which indicates that the Average EVM (Data) value is -40.7035275551 dB.

READ:WLAN:AY:SUMMary:EVM:DATA:AVERage:STATus? (Query Only)

Query the Average EVM (Data) Status in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:DATA:AVERage:STATus?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:EVM:DATA:AVER:STAT?` may return `PASS`, `FAIL`, or `NA`.

READ:WLAN:AY:SUMMary:EVM:DATA:MAX? (Query Only)

Query the Maximum EVM (Data) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:DATA:MAX?`

Returns

<NRf>

Units: dB or % (based on the selected EVM unit)

Examples

READ:WLAN:AY:SUMM:EVM:DATA:MAX? may return 922.1968241036e-3, which indicates that the Maximum EVM (Data) value is 922.1968241036e-3 dB.

READ:WLAN:AY:SUMMary:EVM:DATA:SIGma? (Query Only)

Query the Standard Deviation (1-Sigma) of the EVM Data.

When the EVM unit is in dB, it queries the Standard Deviation after converting evm values to the dB scale.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:EVM:DATA:SIGma?

Returns

<NRf>

Units: dB

Examples

READ:WLAN:AY:SUMM:EVM:DATA:SIG? may return 1.8950, which indicates that the 1-Sigma EVM Data value is 1.8950 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:EVM? (Query Only)

Query the EVM value that occurs in the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:EVM?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:DATA:EVM?` may return `-33.5668742100`, which indicates that the EVM value is -33.5668742100%.

READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:PEAK? (Query Only)

Query the value of the Peak Error that occurs at the given Symbol in the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:PEAK?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:DATA:PEAK?` may return `-26.5964736883`, which indicates that the value of the Peak Error is -26.5964736883 at the given Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:STATus? (Query Only)

Query the status of the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:STATus?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:DATA:STAT?` may return `PASS`, `FAIL`, or `NA`.

READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the Data Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:DATA:SYMBol?`

Returns

`<NRf>`

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:DATA:SYMB?` may return `4.6610000000e+3`, which indicates that the Peak Error occurs at the 4.6610000000e+3 Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:EVM? (Query Only)

Query the EVM value in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:EVM?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:EDMG:CEF:EVM?` may return `6.9680400193`, which indicates that the EVM value is -6.9680400193 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in the 11ay 2.16 GHz BW and EDMG CEF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:PEAK?
```

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

READ:WLAN:AY:SUMM:EVM:PACK:EDMG:CEF:PEAK? may return 13.7763872743, which indicates that the Peak Error value is 13.7763872743% at the given Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the 11ay 2.16 GHz BW and EDMG CEF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:CEF:SYMBol?
```

Returns

<NRf>

Examples

READ:WLAN:AY:SUMM:EVM:PACK:EDMG:CEF:SYMB? may return 7.4020000000e+3, which indicates that the Peak Error occurs at the 7.4020000000e+3 Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:EVM? (Query Only)

Query the EVM value in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:EVM?
```

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

READ:WLAN:AY:SUMM:EVM:PACK:EDMG:STF:EVM? may return -22.9729890175, which indicates that the EVM value is -22.9729890175 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:PEAK?

Returns

<NRf>

Units: dB or % (based on the EVM unit selected)

Examples

READ:WLAN:AY:SUMM:EVM:PACK:EDMG:STF:PEAK? may return 38.8123661280, which indicates that the Peak Error value is 38.8123661280% at the given Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the 11ay 2.16 GHz BW and EDMG STF for 11ay 4.32 GHz BW of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:EVM:PACKet:EDMG:STF:SYMBol?

Returns

<NRf>

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:EDMG:STF:SYMB?` may return `0.0000`, which indicates that the Peak Error occurs at the 0.0000 Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:GUARd:EVM? (Query Only)

Query the EVM value in the Guard Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:GUARd:EVM?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:GUAR:EVM?` may return `-65.4983500315`, which indicates that the value of the EVM is -65.4983500315 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:GUARd:PEAK? (Query Only)

Query the value of the Peak Error that occurs at the given Symbol in the Guard Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:GUARd:PEAK?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:GUAR:PEAK?` may return `-26.5964736883`, which indicates that the value of the Peak Error is -26.5964736883 at the given Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:GUARd:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the Guard Region of the packet in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:GUARd:SYMBol?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:GUAR:SYMB?` may return `3.3340000000e+3`, which indicates that the Peak Error occurs at the 3.3340000000e+3 Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:HEADer:EVM? (Query Only)

Query the EVM value in the Header Region of the packet (excluding GI symbols) in the Summary display. This command is not applicable for 11ay 4.32 GHz BW and the value can be ignored.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:HEADer:EVM?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:HEAD:EVM?` may return `-67.1981081169`, which indicates that the EVM value in the Header Region is -67.1981081169 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:HEADer:PEAK? (Query Only)

Query the Peak Error that occurs at the given Symbol in Header Region (excluding GI symbols) of the packet in the Summary display. This command is not applicable for 11ay 4.32 GHz BW and the value can be ignored.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:HEADer:PEAK?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:HEAD:PEAK?` may return `-60.9603086224`, which indicates that the Peak Error value is -60.9603086224 dB at the given Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:HEADer:SYMBol? (Query Only)

Query the Symbol at which the Peak Error occurs in the Header Region of the packet (excluding GI symbols) in the Summary display. This command is not applicable for 11ay 4.32 GHz BW and the value can be ignored.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:HEADer:SYMBol?`

Returns

`<NRf>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:HEAD:SYMB?` may return `3.3970000000e+3`, which indicates that the peak error occurs at the 3.3970000000e+3 Symbol.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:A1Header:EVM? (Query Only)

Query the value of the Pre-EDGM1 Header-A EVMpacket information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:A1Header:EVM?
```

Returns

```
<string>
```

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE1E:A1H:EVM?` may return `-34.3702`, which indicates that the value of the Pre-EDGM1 Header-A EVM packet is -34.3702 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:CEF1:EVM? (Query Only)

Query the value of the Pre-EDMG1 CEF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:CEF1:EVM?
```

Returns

```
<string>
```

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE1E:CEF1:EVM?` may return `-34.5666`, which indicates that the value of the Pre-EDMG1 CEF EVM packet is -34.5666 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:GUARd1:EVM? (Query Only)

Query the value of the Pre-EDMG1 EVM Guard packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:GUARd1:EVM?
```

Returns

<string>

Units: dB or % (based on the EVM unit selected)

Examples

READ:WLAN:AY:SUMM:EVM:PACK:PRE1ELGUAR1:EVM? may return -34.1327, which indicates that the value of the Pre-EDMG1 EVM Guard Region is -34.1327 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:HEADer1:EVM? (Query Only)

Query the value of the Pre-EDMG1 L-Header EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:HEADer1:EVM?

Returns

<string>

Units: dB or % (based on the EVM unit selected)

Examples

READ:WLAN:AY:SUMM:EVMPACK:PRE1E:HEAD1:EVM? may return -34.4326, which indicates that the value of the Pre-EDMG1 L-Header EVM packet is -34.4326 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:STF1:EVM? (Query Only)

Query the value of the Pre-EDMG1 STF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE1Edmg:STF1:EVM?

Returns

<string>

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE1E:STF1:EVM?` may return `-33.6325`, which indicates that the value of the Pre-EDMG1 STF1 EVM packet is -33.6325 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:A2Header:EVM? (Query Only)

Query the value of the Pre-EDMG2 EDMG Header-A EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:A2Header:EVM?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE2E:A2H:EVM?` may return `-34.37`, which indicates that the value of the Pre-EDMG2 EDMG-Header-A EVM packet is -34.37 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:CEF2:EVM? (Query Only)

Query the value of the Pre-EDMG2 CEF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:CEF2:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE2E:CEF2:EVM?` may return `-34.5665`, which indicates that the value of the Pre-EDMG2 CEF EVM packet is -34.5665 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:GUARd2:EVM? (Query Only)

Query the value of the Pre-EDMG2 Guard EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:GUARd2:EVM?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE2E:GUAR:EVM?` may return `-33.137`, which indicates that the value of the Pre-EDMG2 Guard EVM packet is -33.137 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:HEADer2:EVM? (Query Only)

Query the value of the Pre-EDMG2 L-Header EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:HEADer2:EVM?`

Returns

`<string>`

Units: dB or % (based on the EVM unit selected)

Examples

`READ:WLAN:AY:SUMM:EVM:PACK:PRE2E:HEAD2:EVM?` may return `-34.4321`, which indicates that the value of the Pre-EDMG2 L-Header EVM packet is -34.4321 dB.

READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:STF2:EVM? (Query Only)

Query the value of the Pre-EDMG2 STF EVM packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax
`READ:WLAN:AY:SUMMary:EVM:PACKet:PRE2Edmg:STF2:EVM?`

Returns
`<string>`

Units: dB or % (based on the EVM unit selected)

Examples
`READ:WLAN:AY:SUMM:EVM:PACK:PRE2E:STF2:EVM?` may return `-33.6324`, which indicates that the value of the Pre-EDMG2 STF2 EVM packet is -33.6324 dB.

READ:WLAN:AY:SUMMary:FERRor:AVERage? (Query Only)
Query the Average Frequency Error in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:FERRor:AVERage?`

Returns
`<NRf>`

Units: ppm

Examples
`READ:WLAN:AY:SUMM:FERR:AVER?` may return `-114.1332879317e-3`, which indicates that the Average Frequency Error value is -114.1332879317e-3 ppm.

READ:WLAN:AY:SUMMary:FERRor:AVERage:STATus? (Query Only)
Query the Average Frequency Error status in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:FERRor:AVERage:STATus?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:FERR:AVER:STAT?` may return `PASS`, `FAIL`, or `NA`.

READ:WLAN:AY:SUMMary:FERRor:HERTz? (Query Only)

Query the Frequency Error value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:FERRor:HERTz?`

Returns

`<NRf>`

Units: Hz or kHz

Examples

`READ:WLAN:AY:SUMM:FERR:HERT?` may return `2.875e+3`, which indicates that the Frequency Error value is 2.875 kHz.

READ:WLAN:AY:SUMMary:FERRor:MAX? (Query Only)

Query the Maximum Frequency Error value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:FERRor:MAX?`

Returns

`<NRf>`

Units: ppm

Examples

`READ:WLAN:AY:SUMM:FERR:MAX?` may return `-114.1332879317e-3`, which indicates that the Maximum Frequency Error value is -114.1332879317e-3 ppm.

READ:WLAN:AY:SUMMary:FERRor:PPM? (Query Only)

Query the Frequency Error value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:FERRor:PPM?
```

Returns

<NRf>

Units: ppm

Examples

READ:WLAN:AY:SUMM:FERR:PPM? may return 575.023e-3, which indicates that the Frequency Error value is 575.023e-3 ppm.

READ:WLAN:AY:SUMMary:FERRor:STATus? (Query Only)

Query the Frequency Error status in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:FERRor:STATus?
```

Returns

<string>

Examples

READ:WLAN:AY:SUMM:FERR:STAT? may return PASS, FAIL, or NA.

READ:WLAN:AY:SUMMary:IQ:GAIN:IMBALance? (Query Only)

Query the IQ Gain Imbalance in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

```
READ:WLAN:AY:SUMMary:IQ:GAIN:IMBALance?
```

Returns

<NRf>

Units: dB

Examples

`READ:WLAN:AY:SUMM:IQ:GAIN:IMBAL?` may return `69.2700818181e-3`, which indicates that the IQ Gain Imbalance value is 69.2700818181e-3 dB.

READ:WLAN:AY:SUMMary:IQ:ORIGin:OFFSet? (Query Only)

Query the IQ Origin Offset value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:IQ:ORIGin:OFFSet?`

Returns

`<NRf>`

Units: dB

Examples

`READ:WLAN:AY:SUMM:IQ:ORIG:OFFS?` may return `-160.0000000000`, which indicates that the IQ Origin Offset value is -160.0000000000 dB.

READ:WLAN:AY:SUMMary:IQ:QUADrature:ERROr? (Query Only)

Query the IQ Quadrature Error value (degrees) in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:IQ:QUADrature:ERROr?`

Returns

`<NRf>`

Units: degrees

Examples

`READ:WLAN:AY:SUMM:IQ:QUAD:ERRO?` may return `-220.5967903137e-3`, which indicates that the IQ Quadrature Error value is -220.5967903137e-3º degrees.

READ:WLAN:AY:SUMMary:PACKet:BEAMformed? (Query Only)

Query the value of the Beamformed packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:BEAMformed?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:PACK:BEAM?` may return `0`, which indicates that the value of the Beamformed packet is 0.

READ:WLAN:AY:SUMMary:PACKet:BWBitmap? (Query Only)

Query the value of the Bandwidth BitMap packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:BWBitmap?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:PACK:BWB?` may return `11000000`, which indicates that the value of the Bandwidth BitMap packet is 11000000.

READ:WLAN:AY:SUMMary:PACKet:COMPbw? (Query Only)

Query the value of the Compressed BW packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:COMPbw?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:PACK:COMP?` may return `2`, which indicates that the value of the Compressed BW packet is 2.

READ:WLAN:AY:SUMMary:PACKet:CRC? (Query Only)

Query the value of the CRC packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:CRC?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:PACK:CRC?` may return `0110001001011010`, which indicates that the value of the CRC packet is 0110001001011010.

READ:WLAN:AY:SUMMary:PACKet:EDMGmcs? (Query Only)

Query the value of the EDMG MCS packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:EDMGmcs?`

Returns

`<NRf>`

Examples

`READ:WLAN:AY:SUMM:PACK:EDMG?` may return `5`, which indicates that the value of the EDMG MCS packet is 5.

READ:WLAN:AY:SUMMary:PACKet:LDPCcwlen? (Query Only)

Query the value of the additional LPDC CW Length packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax
`READ:WLAN:AY:SUMMary:PACKet:LDPCcwlen?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:PACK:LDPC?` may return `0`, which indicates that the value of the LDPC CW Length packet is 0.

READ:WLAN:AY:SUMMary:PACKet:PRIMarychannel? (Query Only)
Query the value of the Primary Channel packet information in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:PACKet:PRIMarychannel?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:PACK:PRIM?` may return `0`, which indicates that the value of the Primary Channel packet is 0.

READ:WLAN:AY:SUMMary:PACKet:PSDUlen? (Query Only)
Query the Length value of the packet information in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:PACKet:PSDUlen?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:PACK:PSDU?` may return `1000`, which indicates that the Length value of the packet is 1000.

READ:WLAN:AY:SUMMary:PACKet:RSSI? (Query Only)

Query the value of the last RSSI packet information in the Summary display.

The first 2 bits of the last RSSI will fetch the Guard Interval type for EDMG (00/01/10 - Short/Normal/Long).

Conditions

Measurement view 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:RSSI?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:PACK:RSSI?` may return `0000`, which indicates that the last value of the RSSI packet is 0000.

READ:WLAN:AY:SUMMary:PACKet:SCRAmbler:INITialization? (Query Only)

Query the value of the Scrambler Initialization packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:PACKet:SCRAmbler:INITialization?`

Returns

`<string>`

Examples

`READ:WLAN:AY:SUMM:PACK:SCRA:INIT?` may return `0101110`, which indicates that the value of the Scrambler Initialization packet is 0101110.

READ:WLAN:AY:SUMMary:PACKet:SPATialstreams? (Query Only)

Query the value of the Spatial Streams packet information in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax
`READ:WLAN:AY:SUMMary:PACKet:SPATialstreams?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:PACK:SPAT?` may return `0`, which indicates that the value of the Spatial Streams packet is 0.

READ:WLAN:AY:SUMMary:PACKet:STBCapplied? (Query Only)
Query the value of the STBC Applied packet information in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:PACKet:STBCapplied?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:PACK:STBC?` may return `0`, which indicates that the value of the STBC Applied packet is 0.

READ:WLAN:AY:SUMMary:PACKet:TRNLen? (Query Only)
Query the value of the EDMG TRN Length packet information in the Summary display.

Conditions
Measurement view: 802.11ay Analysis Summary

Group
Read commands

Syntax
`READ:WLAN:AY:SUMMary:PACKet:TRNLen?`

Returns
`<string>`

Examples
`READ:WLAN:AY:SUMM:PAC:TRNL?` may return 0, which indicates that the value of the EDMG TRN Length packet is 0.

READ:WLAN:AY:SUMMary:RCPI? (Query Only)
Query the RCPI (Received Channel Power Indicator) value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:RCPI?`

Returns

`<NR1>`

Examples

`READ:WLAN:AY:SUMM:RCPI?` may return `207.0000000000`, which indicates that the RCPI value is 207.0000000000.

READ:WLAN:AY:SUMMary:RF:POWer? (Query Only)

Query the Radio Frequency (RF) Output Power value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:RF:POWer?`

Returns

`<NRf>`

You must select the units in the Units tab.

Examples

`READ:WLAN:AY:SUMM:RF:POW?` may return `-6.3434391022`, which indicates that the Radio Frequency Output Power value is -6.3434391022.

READ:WLAN:AY:SUMMary:SIG:QUAlity? (Query Only)

Query the Signal Quality value in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Read commands

Syntax

`READ:WLAN:AY:SUMMary:SIG:QUAlity?`

Returns

<NRf>

Units: rho

Examples

READ:WLAN:AY:SUMM:SIG:QUA? may return 999.6323e-3,, which indicates that the Signal Quality value is 999.6323e-3 rho.

READ:WLAN:CONSte:MAGNitude? (Query Only)

Returns the magnitude data for the WLAN constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

READ:WLAN:CONSte:MAGNitude?

Returns

Returned data is in the form

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

READ:WLAN:CONS:MAGN? might return #510400.. (10400-byte data) for the measurement.

READ:WLAN:CONSte:PHASe? (Query Only)

Returns the phase data for the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

READ:WLAN:CONSte:PHASe?

Returns

Returned data is in the form

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

READ:WLAN:CONS:PHAS? might return #510400.. (10400-byte data) for the measurement.

READ:WLAN:CONSte:TYPE? (Query Only)

Returns the type (context) of the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

READ:WLAN:CONSte:TYPE?

Returns

#<num_digit><num_byte><data(1)><data(2)>..<data(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<data(n)> is the data value at the nth data point in 16-bit little endian integers.

The integers must be translated to the proper context as listed below.

Integer value Type (context):

- 0 Pilot
- 1 Data
- 2 Unused or Null

Examples

READ:WLAN:CONS:TYPE? might return #41352.. (1352-byte data) for the measurement. The actual data must be decoded to the context type using the table above.

READ:WLAN:CONSte:VALue? (Query Only)

Returns the value (decoded symbol) for the WLAN Constellation measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:CONSte:VALue?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in 16-bit little endian integers.

Examples

`READ:WLAN:CONSTE:VALUE?` might return #41352 indicating 1352 bytes of data for the measurement.

READ:WLAN:CRESponse:MAGNitude? (Query Only)

Returns the magnitude data for the WLAN Channel Response measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:CRESponse:MAGNitude?`

Returns

Returned data is in the form

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

`READ:WLAN:CRES:MAGN?` might return #510400.. (10400-byte data) for the measurement.

READ:WLAN:CRESponse:PHASe? (Query Only)

Returns the phase data for the WLAN Channel Response measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:CRESponse:PHASe?`

Returns

Returned data is in the form

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in dB, 4-byte little endian floating-point format specified in IEEE 488.2

Examples

`READ:WLAN:CRES:PHAS?` might return `#510400` (10400-byte data) representing the phase data for the measurement.

READ:WLAN:EVM:TRACe<x>? (Query Only)

Returns the trace data for the selected WLAN EVM trace.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbol.

When <x> is 3, the parameter is Average versus Subcarrier

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:EVM:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:EVM:TRAC2?` might return `#510400..` (10400-byte data) for the measurement.

READ:WLAN:FLATness:PASS? (Query Only)

Queries whether the average power level values of the subcarriers across the signal bandwidth on the WLAN Spectral Flatness display remain within the limits defined for a particular standard.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Group

Read commands

Syntax

`READ:WLAN:FLATness:PASS?`

Returns

Returns "1" in the case that all data remains within the defined limits, and "0" otherwise.

Examples

`READ:WLAN:FLAT:PASS?` might return `1`, which means that the average power level values of subcarriers across the signal bandwidth remains within the defined limits.

READ:WLAN:FLATness:RESult? (Query Only)

Returns the summary results of each segment of the WLAN Spectral Flatness display.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:FLATness:RESult?`

Returns

The data is returned as 12 comma delineated text values. The specific values are :

- minimum subcarrier within segment 1
- minimum subcarrier average energy deviation from the global average within segment 1
- deviation the of minimum subcarrier average from the allowed value in segment 1
- maximum subcarrier within segment 1
- maximum subcarrier average energy deviation from the global average within segment 1
- deviation of the maximum subcarrier average from the allowed value in segment 1
- minimum subcarrier within segment 2
- minimum subcarrier average energy deviation from the global average within segment 2
- deviation the of minimum subcarrier average from the allowed value in segment 2

- maximum subcarrier within segment 2
- maximum subcarrier average energy deviation from the global average within segment 2
- deviation of the maximum subcarrier average from the allowed value in segment 2

Examples

`READ:WLAN:FLAT:RES?` might return `-6.0000000000,-17.0626174659E-3,3.9829373825,12.0000000000,19.979260861`, which represents the summary results of each segment of the WLAN Spectral Flatness display.

READ:WLAN:FLATness:TRACe<x>? (Query Only)

Returns the WLAN Spectral Flatness trace data. When <x> is 1, the parameter is Matrix (symbol deviation per subcarrier). When <x> is 2, the parameter is Average Deviation vs Subcarrier.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:FLATness:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:FLAT:TRAC2` might return `#510400..` (10400-byte data) for the measurement.

READ:WLAN:MERRor:TRACe<x>? (Query Only)

Returns the trace data for the selected WLAN Magnitude Error trace.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbol.

When <x> is 3, the parameter is Average versus Subcarrier

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:MERRor:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:MERR:TRAC2?` might return `#510400..` (10400-byte data) for the measurement.

READ:WLAN:PERRor:TRACe<x>? (Query Only)

Returns the trace data for the selected WLAN Phase Error trace.

When <x> is 1, the parameter is Matrix.

When <x> is 2, the parameter is Average versus Symbol.

When <x> is 3, the parameter is Average versus Subcarrier

Group

Read commands

Syntax

`READ:WLAN:PERRor:TRACe<x>?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point in percent (%), 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:PERR:TRAC2?` might return `#510400..` (10400-byte data) for the measurement.

READ:WLAN:PVTime:BURSt:POWer? (Query Only)

Returns the average power of the burst packet, in dBm, for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:BURSt:POWer?`

Returns

Floating point number that represents the average power of the burst packet, in dBm.

Examples

`READ:WLAN:PVT:BURST:POWER?` might return `-1.99`, which represents the value of the average power of the burst packet of -1.99 dBm.

READ:WLAN:PVTime:BURSt:WIDTh? (Query Only)

Returns the value of the measured time width of the burst packet from Power-On to Power-Down (or end of waveform, if that occurs before Power-Down), in seconds, for the WLAN Power vs. Time trace.

Group

Read commands

Syntax

`READ:WLAN:PVTime:BURSt:WIDTh?`

Returns

Floating point number which represents the value of the measured time width of the burst packet from Power-On to Power-Down (or end of waveform, if that occurs before Power-Down), in seconds.

Examples

`READ:WLAN:PVT:BURST:WIDTH?` might return `156.0000000000E-6`, which represents a burst packet width of 156 µS.

READ:WLAN:PVTime:FALL:TIME? (Query Only)

Queries the value of the width of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:FALL:TIME?`

Returns

Floating point number which represents the value of the width of the falling edge of the burst, in seconds.

Examples

`READ:WLAN:PVT:FALL:TIME?` might return `7e-6`, which indicates the width value of the falling edge is 7 µs.

READ:WLAN:PVTime:FALL:TIME:STARt? (Query Only)

Queries the value of the start time of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:FALL:TIME:STARt?`

Returns

Floating point number which represents the value of the start time of the falling edge of the burst, in seconds.

Examples

`READ:WLAN:PVT:FALL:TIME:STAR?` might return `6e-6`, which indicates that the start time value of the falling edge is at 6 µs.

READ:WLAN:PVTime:FALL:TIME:STOP? (Query Only)

Queries the value of the stop time of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:FALL:TIME:STOP?`

Returns

Floating point number which represents the value of the stop time of the falling edge of the burst, in seconds.

Examples

`READ:WLAN:PVT:FALL:TIME:STOP?` might return `7e-6`, which indicates the stop time value of the falling edge is at 7 µs.

READ:WLAN:PVTime:FTIMe? (Query Only)

Queries the value of the width of the falling edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:FTIMe?`

Returns

Floating point number which represents the value of the width of the falling edge of the burst, in seconds.

Examples

`READ:WLAN:PVT:FALL:TIME?` might return `7e-6`, which indicates the width of the falling edge is 7 µs.

READ:WLAN:PVTime:RISE:TIME? (Query Only)

Queries the value of the width of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:RISE:TIME?`

Returns

Floating point number which represents the value of the width of the rising edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:RISE:TIME?` might return `7e-6`, which indicates the width value of the rising edge is 7 µs.

READ:WLAN:PVTime:RISE:TIME:STARt? (Query Only)

Queries the value of the start time of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:RISE:TIME:STARt?`

Returns

Floating point number which represents the value of the start time of the rising edge of the burst, in seconds.

Examples

`READ:WLAN:PVT:RISE:TIME:STAR?` might return `6e-6`, which indicates the start time value of the rising edge is at 6 µs.

READ:WLAN:PVTime:RISE:TIME:STOP? (Query Only)

Queries the value of the stop time of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:RISE:TIME:STOP?`

Returns

Floating point number which represents the value of the stop time of the rising edge of the burst, in seconds.

Examples

`FETCH:WLAN:PVT:RISE:TIME:STOP?` might return `7e-6`, which indicates the stop time value of the rising edge is at 7 s.

READ:WLAN:PVTime:RTIMe? (Query Only)

Queries the value of the width of the rising edge, in seconds.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:RTIMe?`

Returns

Floating point number which represents the value of the width of the rising edge of the burst, in seconds.

Examples

`READ:WLAN:PVT:RISE:TIME?` might return `7e-6`, which indicates the width value of the rising edge is 7 µs.

READ:WLAN:PVTime:TRACe:X? (Query Only)

Returns the horizontal values (time in seconds) for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:TRACe:X?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:PVT:TRAC:X` might return `#43204` (3204-byte data), which represents the value of the time in seconds (horizontal values) for the WLAN Power vs. Time trace.

READ:WLAN:PVTime:TRACe:XY? (Query Only)

Returns the horizontal value (time in seconds) and vertical value (power) for the WLAN Power vs. Time trace.

<x(n)><y(n)> is the horizontal value and vertical value pair at the nth data point.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:TRACe:XY?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`READ:WLAN:PVT:TRAC:XY?` might return `#43204` (3204-byte data), which represents the horizontal value (time in seconds) and vertical value (power) pair at the nth data point.

READ:WLAN:PVTime:TRACe[:Y]? (Query Only)

Returns the vertical values (power) for the WLAN Power vs. Time trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:PVTime:TRACe[:Y]?`

Returns

`#<num_digit><num_byte><data(1)><data(2)>..<data(n)>`

Where:

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

`<data(n)>` is the data value at the nth data point, 4-byte little endian floating-point format specified in IEEE 488.2.

Examples

`FETCH:WLAN:PVT:TRAC:Y?` might return `#43204` (3204-byte data), which represents the vertical values (power) for the WLAN Power vs. Time trace.

READ:WLAN:STABle:VALUe? (Query Only)

Returns the number of bytes in the symbol table for the WLAN measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:STABle:VALUe?`

Returns

`#<num_digit><num_byte>`

Where

`<num_digit>` is the number of digits in `<num_byte>`.

`<num_byte>` is the number of bytes of data that follow.

Examples

`READ:WLAN:STABLE:VALUE?` might return `#43848`, indicating that there are 3848 bytes of data in the symbol table.

READ:WLAN:SUMMary:BURSt:INDex? (Query Only)

Returns the index of the analyzed packet within the analysis record.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:SUMMary:BURSt:INDex?`

Arguments

None

Returns

`<NRf>` data in dB.

READ:WLAN:SUMMary:BURSt:POWer? (Query Only)

Returns the average power of all symbols in the packet, including Preamble and Data segments.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

`READ:WLAN:SUMMary:BURSt:POWer?`

Arguments

None

Returns

`<NRf>` data in dBm.

READ:WLAN:SUMMary:BURSt:POWer:CFACtor? (Query Only)

Returns the peak-to-average burst power factor in the WLAN measurement. The ratio of the highest instantaneous signal power level to the average signal power.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:BURSt:POWer:CFACtor?
```

Arguments

None

Returns

<NRf> data in dB.

READ:WLAN:SUMMary:CERRor? (Query Only)

Returns the symbol clock error in the WLAN measurement.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:CERRor?
```

Arguments

None

Returns

<NRf> data in parts per million.

READ:WLAN:SUMMary:CPE? (Query Only)

Returns the RMS magnitude error of the pilots over all data symbols.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:CPE?
```

Arguments

None

Returns

<NRf> data in percent.

READ:WLAN:SUMMary:EVM:PEAK:ALL? (Query Only)

Returns the peak EVM value for all subcarriers in the WLAN measurement or for all chips depending on the selected standard.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:ALL?
```

Arguments

None

Returns

<NRf> data in dB.

READ:WLAN:SUMMary:EVM:PEAK:CHIP:ALL? (Query Only)

Returns the chip at which the reported peak EVM value occurred.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:CHIP:ALL?
```

Arguments

None

Returns

<NR1>

READ:WLAN:SUMMary:EVM:PEAK:CHIP:ONEKchips? (Query Only)

Returns the chip at which the reported peak EVM value over the first 1000 chips occurred.

Only available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:CHIP:ONEKchips?
```

Arguments

None

Returns

<NR1>

READ:WLAN:SUMMary:EVM:PEAK:DATA? (Query Only)

Returns the peak EVM value for the data subcarriers in the WLAN measurement.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:DATA?
```

Arguments

None

Returns

<NRf> data in dB.

READ:WLAN:SUMMary:EVM:PEAK:ONEKchips? (Query Only)

Returns the peak EVM value measured over the first 1000 chips.

Available only for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax
`READ:WLAN:SUMMary:EVM:PEAK:ONEKchips?`

Arguments
None

Returns
`<NRf>` data in dB.

READ:WLAN:SUMMary:EVM:PEAK:PILots? (Query Only)
Returns the peak EVM value for the pilots in the WLAN measurement.

Not available for 802.11b.

Conditions
Measurement view: WLAN

This command requires WLAN Measurements

Group
Read commands

Syntax
READ:WLAN:SUMMary:EVM:PEAK:PILots?

Arguments
None

Returns
`<NRf>` data in dB.

READ:WLAN:SUMMary:EVM:PEAK:SCARrier:ALL? (Query Only)
Returns the subcarrier on which the ALL peak EVM value occurred.

Conditions
Measurement view: WLAN

This command requires WLAN Measurements

Group
Read commands

Syntax
`READ:WLAN:SUMMary:EVM:PEAK:SCARrier:ALL?`

Arguments
None

Returns
`<NR1>`

READ:WLAN:SUMMary:EVM:PEAK:SCARrier:DATA? (Query Only)

Returns the subcarrier on which the DATA peak EVM value occurred.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:SCARrier:DATA?
```

Arguments

None

Returns

```
<NR1>
```

READ:WLAN:SUMMary:EVM:PEAK:SCARrier:PILots? (Query Only)

Returns the subcarrier on which the PILOT peak EVM value occurred.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:SCARrier:PILots?
```

Arguments

None

Returns

```
<NR1>
```

READ:WLAN:SUMMary:EVM:PEAK:SYMBol:ALL? (Query Only)

Returns the symbol on which the reported EVM value occurred.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:SYMBol:ALL?
```

Arguments

None

Returns

<NR1>

READ:WLAN:SUMMary:EVM:PEAK:SYMBol:DATA? (Query Only)

Returns the symbol on which the DATA peak EVM value occurred.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:SYMBol:DATA?
```

Arguments

None

Returns

<NR1>

READ:WLAN:SUMMary:EVM:PEAK:SYMBol:PILots? (Query Only)

Returns the symbol on which the PILOT peak EVM value occurred.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:PEAK:SYMBol:PILots?
```

Arguments

None

Returns

<NR1>

READ:WLAN:SUMMary:EVM:RMS:ALL? (Query Only)

Returns the RMS EVM data for all subcarriers in the WLAN measurement and for all chips for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

READ:WLAN:SUMMary:EVM:RMS:ALL?

Arguments

None

Returns

<NRf> RMS EVM in dB

READ:WLAN:SUMMary:EVM:RMS:AVERage? (Query Only)

Returns the average RMS EVM value in the WLAN measurement over the selected number of bursts.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

READ:WLAN:SUMMary:EVM:RMS:AVERage?

Arguments

None

Returns

<NRf> RMS EVM in dB

READ:WLAN:SUMMary:EVM:RMS:DATA? (Query Only)

Returns the RMS EVM data for the data subcarriers in the WLAN measurement.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:RMS:DATA?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

READ:WLAN:SUMMary:EVM:RMS:MAXimum? (Query Only)

Returns the maximum RMS EVM value in the WLAN measurement over the selected number of bursts.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:RMS:MAXimum?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

READ:WLAN:SUMMary:EVM:RMS:ONEKchips? (Query Only)

Returns the RMS EVM data for the 1k chips in the WLAN measurement measured over the first 1000 chips.

Only available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:RMS:ONEKchips?
```

Arguments

None

Returns

<NRf> RMS EVM in dB

READ:WLAN:SUMMary:EVM:RMS:PILots? (Query Only)

Returns the RMS EVM data for the pilot subcarriers in the WLAN measurement.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:EVM:RMS:PILots?
```

Arguments

None

Returns

<NRf> data in percent.

READ:WLAN:SUMMary:FERRor? (Query Only)

Returns the frequency difference between the measured carrier frequency of the signal and the measurement frequency setting.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:FERRor?
```

Arguments

None

Returns

<NRf> data in kHz.

READ:WLAN:SUMMary:HEADer? (Query Only)

Returns the received packet header information for the WLAN measurement.

Applies to the 802.11b standard only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:HEADer?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

READ:WLAN:SUMMary:HTSig? (Query Only)

Returns the decimal values of the received packet HT-SIGNAL. Applies to the 802.11n standard only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:HTSig?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

READ:WLAN:SUMMary:IQOFfset? (Query Only)

Returns the average magnitude of the DC subcarrier level relative to total signal power.

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:IQOFfset?
```

Arguments

None

Returns

<NRf> data in dB.

READ:WLAN:SUMMary:LSIG? (Query Only)

Returns the decimal values of the received packet (legacy) SIGNAL symbols fields. Applies to the 802.11n standard only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:LSIG?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

READ:WLAN:SUMMary:PACKet? (Query Only)

Returns the type and number of symbols, EVM-RMS and average power of the Preamble and Data portions of the packet.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:PACKet?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

READ:WLAN:SUMMary:PACKet:DMODulation? (Query Only)

Returns the modulation used in the Data symbols.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:PACKet:DMODulation?
```

Arguments

None

Returns

<string> The data modulation being used.

READ:WLAN:SUMMary:PACKet:FORMat? (Query Only)

Returns the packet format setting for the WLAN measurement

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:PACKet:FORMat?
```

Arguments

None

Returns

<string> The packet format setting.

READ:WLAN:SUMMary:PACKet:GUARd? (Query Only)

Returns the packet guard interval used by the DATA symbols.

Not available for 802.11b.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:PACKet:GUARd?
```

Arguments

None

Returns

<NRf> The packet guard interval, 1/4 or 1/8.

READ:WLAN:SUMMary:SIG? (Query Only)

Returns the decimal values of the received packet SIGNAL symbols fields.

Available only for 802.11agjp.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:SIG?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

READ:WLAN:SUMMary:VHTSig:A? (Query Only)

Returns the decimal values of the received packet VHT-SIGNAL(A) symbols' fields.

Available only for 802.11ac.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:VHTSig:A?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

READ:WLAN:SUMMary:VHTSig:B? (Query Only)

Returns the decimal values of the received packet VHT-SIGNAL(B) symbols fields.

Available only for 802.11ac.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Read commands

Syntax

```
READ:WLAN:SUMMary:VHTSig:B?
```

Arguments

None

Returns

Results are returned in the same left-to-right order in which they are presented in the display.

Sense commands

[SENSe]:ACPower:AVERage

Sets or queries how to average waveform in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:AVERage { OFF | TIMe | FREQuency }
[SENSe]:ACPower:AVERage?
```

Arguments

`OFF` disables averaging.

`TIMe` averages waveform using time samples.

`FREQuency` averages waveform using frequency samples.

Examples

`SENSe:ACPOWER:AVERAGE TIMe` averages waveform using time samples.

[SENSe]:ACPower:AVERage:COUNt

Sets or queries the number of traces for averaging in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:AVERage:COUNt <number>
[SENSe]:ACPower:AVERage:COUNt?
```

Arguments

`<number>::<NR1>` specifies the average count. Range: 2 to 10000.

Examples

`SENSe:ACPOWER:AVERAGE:COUNT 64` sets the average count to 64.

[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW). Programming a specified RBW sets `[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:AUTO OFF`.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]?
```

Related Commands

[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:AUTO (on page 1983)

Arguments

`<value>::<NRf>` specifies the RBW. Range: 100 Hz to 5 MHz.

Examples

`SENSe:ACPOWER:BANDWIDTH:RESOLUTION 200kHz` sets the RBW to 200 kHz.

[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:ACTual? (Query Only)

Queries the actual resolution bandwidth (RBW) in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:ACTual?
```

Arguments

None

Returns

<NRf> is the actual RBW in Hz.

Examples

SENSe:ACPOWER:BANDWIDTH:RESOLUTION:ACTUAL? might return 299.624E+3, indicating that the actual RBW is 299.624 kHz.

[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:AUTO { OFF | ON | 0 | 1 }
[SENSe]:ACPower:{BANDwidth|BWIDth}[:RESolution]:AUTO?
```

Arguments

OFF or 0 specifies that the RBW is set manually using the [SENSe]:ACPower: {BANDwidth|BWIDth} [:RESolution] command.

ON or 1 specifies that the RBW is set automatically.

Examples

SENSe:ACPOWER:BANDWIDTH:AUTO ON sets the RBW automatically.

[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo

Sets or queries the video bandwidth (VBW). Programming a specified VBW sets [SENSe]:ACPower:{BANDwidth| BWIDth}:VIDeo:STATe OFF.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo <value>
[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo?
```

Related Commands

[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo:STATe (on page 1984)

Arguments

`<value>::<NRf>` specifies the VBW.

Range: Current RBW/10^4 (1 Hz minimum) to Current RBW.

Examples

`SENSe:ACPOWER:BANDWIDTH:VIDEO 200kHz` sets the VBW to 200 kHz.

[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo:STATe

Determines whether to enable or disable the video bandwidth (VBW) in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo:STATe { OFF | ON | 0 | 1 }
[SENSe]:ACPower:{BANDwidth|BWIDth}:VIDeo:STATe?
```

Arguments

`OFF` or `0` disables the VBW.

`ON` or `1` enables the VBW.

Examples

`SENSe:ACPOWER:BANDWIDTH:VIDEO:STATE ON` enables the VBW.

[SENSe]:ACPower:CHANnel:{BANDwidth|BWIDth}

Sets or queries frequency bandwidth of each channel (all share the same value) in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:CHANnel:{BANDwidth|BWIDth} <value>
[SENSe]:ACPower:CHANnel:{BANDwidth|BWIDth}?
```

Arguments

`<value>::<NRf>` specifies the channel bandwidth. Range: 1 Hz to full span.

Examples

`SENSe:ACPOWER:CHANNEL:BANDWIDTH 1.5MHz` sets the channel bandwidth to 1.5 MHz.

[SENSe]:ACPower:CHANnel:FILTer

Sets or queries the adjacent channel filter in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:CHANnel:FILTer { RRCosine | NONE }
[SENSe]:ACPower:CHANnel:FILTer?
```

Arguments

`RRCosine` uses the Root-Raised Cosine filter.

`NONE` uses no filter.

Examples

`SENSe:ACPOWER:CHANNEL:FILTER RRCosine` uses the Root-Raised Cosine filter for the Channel power and ACPR measurement.

[SENSe]:ACPower:CHANnel:PAIRs

Sets or queries the number of adjacent channel pairs (upper and lower) in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:CHANnel:PAIRs <number>
[SENSe]:ACPower:CHANnel:PAIRs?
```

Arguments

`<number>::<NR1>` specifies the number of adjacent pairs. Range: 0 to 50.

Examples

`SENSe:ACPOWER:CHANNEL:PAIRS 5` sets five adjacent channel pairs.

[SENSe]:ACPower:CHANnel:SPACing

Sets or queries frequency difference between centers of each channel in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:CHANnel:SPACing <value>
[SENSe]:ACPower:CHANnel:SPACing?
```

Arguments

`<value>::<NRf>` specifies the channel-to-channel spacing.

Range: 1 Hz to 1 GHz.

Examples

`SENSe:ACPOWER:CHANNEL:SPACING 5MHz` sets the channel-to-channel spacing to 5 MHz.

[SENSe]:ACPower:CHIPrate

Sets or queries the chip rate when `[SENSe]:ACPower:CHANnel:FILTer` is set to RRCosine (Root Raised Cosine).

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:CHIPrate <value>
[SENSe]:ACPower:CHIPrate?
```

Related Commands

[SENSe]:ACPower:CHANnel:FILTer (on page 1985)

Arguments

`<value>::<NRf>` specifies the chip rate. Range: 100 Hz to 105 MHz.

Examples

`SENSe:ACPOWER:CHIPRATE 5kHz` sets the chip rate to 5 kHz.

[SENSe]:ACPower:CLEar:RESults (No Query Form)

Restarts the average trace.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:CLEar:RESults
```

Arguments

None

Examples

`SENSe:ACPOWER:CLEAR:RESULTS` restarts the average trace.

[SENSe]:ACPower:FREQuency

Sets or queries the center frequency in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:FREQuency <value>
[SENSe]:ACPower:FREQuency?
```

Arguments

<value>::<NRf> specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:ACPOWER:FREQUENCY 2.35GHz` sets the center frequency to 2.35 GHz.

[SENSe]:ACPower:FREQuency:STEP

Sets or queries the frequency step size in the Channel power and ACPR measurement. Programming a specified step size sets `[SENSe]:ACPower:FREQuency:STEP:AUTO OFF`.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:FREQuency:STEP <value>
[SENSe]:ACPower:FREQuency:STEP?
```

Related Commands

[SENSe]:ACPower:FREQuency:STEP:AUTO (on page 1988)

Arguments

`<value>::<NRf>` specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:ACPOWER:FREQUENCY:STEP 1kHz` sets the frequency step size to 1 kHz.

[SENSe]:ACPower:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually in the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:ACPower:FREQuency:STEP:AUTO?
```

Arguments

`OFF` or `0` specifies that the frequency step size is set manually using the `[SENSe]:ACPower:FREQuency:STEP` command.

`ON` or `1` specifies that the frequency step size is set automatically.

Examples

`SENSe:ACPOWER:FREQUENCY:STEP:AUTO ON` specifies that the frequency step size is set automatically.

[SENSe]:ACPower:NFLoor:STATe

Determines whether to enable or disable the correction for noise floor.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:NFLoor:STATe { OFF | ON | 0 | 1 }
[SENSe]:ACPower:NFLoor:STATe?
```

Arguments

`OFF` or `0` disables the correction for noise floor.

`ON` or `1` enables the correction for noise floor.

Examples

`SENSe:ACPOWER:NFLOOR:STATE ON` enables the correction for noise floor.

[SENSe]:ACPower:POINts:COUNt

Sets or queries the number of points used for the trace in the Channel Power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:POINts:COUNt { P801 | P2401 | P4001 | P8001 | P10801 }
[SENSe]:ACPower:POINts:COUNt?
```

Arguments

`RTBandwidth` optimizes the measurement for real-time bandwidth.

`DRANge` optimizes the measurement for dynamic range.

Examples

`SENSE:ACPOWER:POINTS:COUNT P4001` sets the number of points used in the trace of the Channel Power and ACPR display to 4001.

[SENSe]:ACPower:RRCRolloff

Sets or queries the filter parameter (roll-off ratio) for the Root Raised Cosine filter.

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:RRCRolloff <value>
[SENSe]:ACPower:RRCRolloff?
```

Related Commands

[SENSe]:ACPower:CHANnel:FILTer (on page 1985)

Arguments

`<value>::<NRf>` specifies the filter parameter.

Range: 0.0001 to 1 in 0.0001 steps.

Examples

`SENSe:ACPOWER:RRCROLLOFF 0.3` sets the filter parameter to 0.3.

[SENSe]:ACPower:SYMBrate

Sets or queries the symbol rate when `[SENSe]:ACPower:CHANnel:FILTer` is set to RRCosine (Root Raised Cosine).

Conditions

Measurement views: Channel power and ACPR

Group

Sense commands

Syntax

```
[SENSe]:ACPower:SYMBrate <value>
[SENSe]:ACPower:SYMBrate?
```

Related Commands

[SENSe]:ACPower:CHANnel:FILTer (on page 1985)

Arguments

`<value>::<NRf>` specifies the symbol rate. Range: 100 Hz to 105 MHz.

Examples

`SENSe:ACPOWER:CHIPRATE 5kHz` sets the symbol rate to 5 kHz.

[SENSe]:ACQuisition:{BANDwidth|BWIDth}

Sets or queries the acquisition bandwidth (frequency range of the acquisition) when `[SENSe]:ACQuisition:MODE` is set to SAMPles or LENGth.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:{BANDwidth|BWIDth} <value>
[SENSe]:ACQuisition:{BANDwidth|BWIDth}?
```

Arguments

`<value>::<NRf>` specifies the acquisition bandwidth.

Range: 1MHz to 40 MHz (Standard) / 110MHz (Option 110).

Examples

`SENSe:ACQUISITION:BANDWIDTH 30MHz` sets the acquisition bandwidth to 30 MHz.

[SENSe]:ACQuisition:FFRame:ACTual? (Query Only)

Queries the actual number of Fast Frames.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FFRame:ACTual?
```

Arguments

None

Returns

`<NR1>` The actual number of Fast Frames.

Examples

`SENSe:ACQUISITION:FFRAME:ACTUAL?` might return 178, indicating that the actual number of Fast Frames is 178.

[SENSe]:ACQuisition:FFRame:LIMit

Sets or queries the limit number of Fast Frames.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FFRame:LIMit
[SENSe]:ACQuisition:FFRame:LIMit?
```

Arguments

`<value>::<NR1>` specifies the fast frame limit. Range: 1 to 65535 frames.

Where 1 to 65535 frames for RSA 5000A series. For others, the range is 1 to 220 -1 frames.

Examples

`SENSe:ACQUISITION:FFRAME:LIMIT 500` sets the Fast Frame limit to 500.

[SENSe]:ACQuisition:FFRame:STATe

Determines whether to enable or disable the Fast Frame.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FFRame:STATe { OFF | ON | 0 | 1 }
[SENSe]:ACQuisition:FFRame:STATe?
```

Arguments

`OFF` or `0` disables the Fast Frame.

`ON` or `1` enables the Fast Frame.

Examples

`SENSe:ACQUISITION:FFRAME:STATE ON` enables the Fast Frame.

[SENSe]:ACQuisition:FSAVe:ENAble

Set or queries the FastSave acquisition mode.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FSAVe:ENAble { OFF | ON | 0 | 1 }
[SENSe]:ACQuisition:FSAVe:ENAble?
```

Arguments

`OFF` or `0` disables the FastSave acquisition.

`ON` or `1` enables the FastSave acquisition..

Examples

`SENSe:ACQUISITION:FSAVE:ENABLE ON` enables the FastSave acquisition.

[SENSe]:ACQuisition:FSAVe:FILEs:MAXimum

Set or queries the FastSave maximum number of files saved per run.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FSAVe:FILEs:MAXimum <value>
```

[SENSe]:ACQuisition:FSAVe:FILEs:MAXimum?

Arguments

<value>::<NR2> specifies the maximum number of files saved per run. Range: 1 to 1,000,000 files.

NOTE: When the FILEs:MAXimum is reached, an event is added to the event queue to indicate that saves are completed. Note that this same event is issued now when Trigger Actions Max total files is reached as well.

Examples

SENSe:ACQUISITION:FSAVE:FILES:MAXIMUM 10 sets the maximum number of files saved per run to 10.

[SENSe]:ACQuisition:FSAVe:FORMat

Set or queries the FastSave file format.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FSAVe:FORMat { TIQ| MAT }
[SENSe]:ACQuisition:FSAVe:FORMat?
```

Arguments

TIQ selects the TIQ file format for FastSave acquisitions.

MAT selects the MAT file format for FastSave acquisitions.

Examples

SENSe:ACQUISITION:FSAVE:FORMAT MAT selects the Matlab file format.

[SENSe]:ACQuisition:FSAVe:LOCation

Set or queries the FastSave file save location (a directory).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FSAVe:LOCation <path>
[SENSe]:ACQuisition:FSAVe:LOCation?
```

Arguments

<path>::<string> specifies the location where FastSave acquisitions will be saved.

Examples

`SENSe:ACQUISITION:FSAVE:LOCATION "C:\RSA5100B Files\Test_folder"` sets location where FastSave acquisitions are saved to C:\RSA5100B Files\Test_folder.

[SENSe]:ACQuisition:FSAVe:NAME:BASE

Set or queries the FastSave Base file name.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:FSAVe:NAME:BASE <file_name>
[SENSe]:ACQuisition:FSAVe:NAME:BASE?
```

Arguments

`<file_name>::<string>` specifies the base file name use for FastSave acquisitions.

Examples

`SENSe:ACQUISITION:FSAVE:NAME:BASE "FSAVE"` sets the Base file name to FSAVE.

[SENSe]:ACQuisition:MEMory:AVAilable:SAMPles? (Query Only)

Returns the amount of acquisition memory available in the instrument.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:MEMory:AVAilable:SAMPles?
```

Arguments

None

Returns

`<NRf>` The amount of acquisition memory available in samples.

Examples

`SENSe:ACQUISITION:MEMORY:AVAILABLE:SAMPLES?` might return 999.424E+3, indicating that 999424 samples are available.

[SENSe]:ACQuisition:MEMory:CAPacity[:TIME]? (Query Only)

Returns the acquisition memory capacity (maximum period of time that can be acquired with the acquisition memory).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:MEMory:CAPacity[:TIME]?
```

Arguments

None

Returns

<NRf> The acquisition memory capacity in seconds.

Examples

SENSe:ACQUISITION:MEMORY:CAPACITY:TIME? might return 26.651E-3, indicating that 26.651 ms can be acquired.

[SENSe]:ACQuisition:MEMory:USED[:PERCent]? (Query Only)

Returns the percentage of the capacity used based on the current settings.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:MEMory:USED[:PERCent]?
```

Arguments

None

Returns

<NRf> The percentage of the capacity used.

Examples

SENSe:ACQUISITION:MEMORY:USED:PERCENT? might return 50.0, indicating that 50% is used.

[SENSe]:ACQuisition:MODE

Sets or queries the acquisition mode (how to determine the sampling parameters of acquisition bandwidth, samples, and length).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:MODE { AUTO | SAMPles | LENGth }
[SENSe]:ACQuisition:MODE?
```

Related Commands

[SENSe]:ACQuisition:{BANDwidth|BWIDth} (on page 1990)

[SENSe]:ACQuisition:SAMPles (on page 2002)

[SENSe]:ACQuisition:SEConds (on page 2003)

Arguments

`AUTO` sets the all sampling parameters automatically.

`SAMPles` sets the acquisition bandwidth and samples manually, using the `[SENSe]:ACQuisition:{BANDwidth|BWIDth}` and :SAMPles commands.

`LENGth` sets the acquisition bandwidth and length manually, using the `[SENSe]:ACQuisition:{BANDwidth|BWIDth}` and :SEConds commands.

Examples

`SENSe:ACQUISITION:MODE AUTO` sets the all sampling parameters automatically.

[SENSe]:ACQuisition:RECord:ACQuisition:{BANDwidth|BWIDth}:AUTO

Set or queries whether the recording acquisition bandwidth is automatic or manual.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:ACQuisition:{BANDwidth|BWIDth}: AUTO { OFF | ON | 0 | 1 }
[SENSe]:ACQuisition:RECord:ACQuisition:{BANDwidth|BWIDth}: AUTO ?
```

Arguments

`ON` or `1` indicates that the acquisition bandwidth during recording is based on the current system acquisition bandwidth.

`OFF` or `0` indicates that the acquisition bandwidth during recording is the selected bandwidth.

Returns

See Arguments.

Examples

`SENSe:ACQUISITION:RECORD:ACQUISITION:BANDWIDTH:AUTO?` might return `0`, indicating that the acquisition bandwidth during recording is the selected bandwidth.

[SENSe]:ACQuisition:RECord:ACQuisition:{BANDwidth|BWIDth} <value>

Set or queries the Acquisition Bandwidth used during recording.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:ACQuisition:{BANDwidth|BWIDth} <value>
[SENSe]:ACQuisition:RECord:ACQuisition:{BANDwidth|BWIDth} <value> ?
```

Arguments

`<value>::<NRf>` specifies the acquisition bandwidth used during recording.

Returns

`<NRf>`

Examples

`SENSe:ACQuisition:RECord:ACQuisition:BWIDth 20` sets the acquisition bandwidth to 20 MHz.

[SENSe]:ACQuisition:RECord:FILE:LENGth

Sets or queries how much data (time in milliseconds, seconds, or minutes) is recorded when recording starts. File Length uses the Max saved files per run: setting to determine how many data files are captured per each recording session.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:FILE:LENGth <numeric>
[SENSe]:ACQuisition:RECord:FILE:LENGth?
```

Arguments

`<numeric>::=<NR3>` determines the file length of each data file saved.

Range: 1E-21 to 10E3 when units set to milliseconds

Range: 1E-5 to 10E3 when units set to seconds

Range: 1E-13 to 10E3 when units set to minutes

Returns

Examples

`SENSe:ACQUISITION:RECORD:FILE:LENGTH 10E2` sets the file length to 1000.

[SENSe]:ACQuisition:RECord:FILE:LENGth:ENABle

Sets or queries the file length conditions to determine how much data is recorded. File Length uses theMax saved files per run: setting to determine how many data files are captured per each recording session.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:FILE:LENGth:ENABle { OFF | ON | 0 | 1 }
[SENSe]:ACQuisition:RECord:FILE:LENGth:ENABle?
```

Arguments

`ON` or `1` enables File Length.

`OFF` or `0` disables File Length.

Examples

`SENSe:ACQUISITION:RECORD:FILE:LENGTH:ENABLE ON` enables the File Length conditions.

[SENSe]:ACQuisition:RECord:FILE:LENGth:UNITs

Sets or queries the units used for the file length setting.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:FILE:LENGth:UNITs { MSEC | SEC | MIN }
```

Arguments

`MSEC`: milliseconds

`SEC`: seconds

`MIN`: minutes

Examples

`SENSe:ACQUISITION:RECORD:FILE:LENGTH:UNITS MSEC` sets the units for the file length to milliseconds.

[SENSe]:ACQuisition:RECord:FILE:LOCation

Sets the file location of the saved data records. To fully support data streaming, the drive selected for recording data must have a minimum write speed of 300 MB/sec.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:FILE:LOCation <file_path>
[SENSe]:ACQuisition:RECord:FILE:LOCation?
```

Arguments

<file_path>::=<"string"> specifies the location.

If you omit the directory path, the default path is used, which is C:\SignalVu-PC Files\Sample Data Records initially.

Examples

SENSe:ACQUISITION:RECORD:FILE:LOCATION "C:\SignalVu-PC Files\Sample Data Records" sets the location of the data records to that location.

[SENSe]:ACQuisition:RECord:FILE:MAXimum

Sets or queries how many times a record is created, of the specified File Length setting. If the File Length is not enabled, this setting is ignored. See the command [:SENSe]:ACQuisition:RECord:FILE:LENGth:ENABle.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:FILE:MAXimum <value>
[SENSe]:ACQuisition:RECord:FILE:MAXimum?
```

Arguments

<value>::=<NR1> the number of records created.

Range: 1 to 1000000.

Examples

SENSe:ACQUISITION:RECORD:FILE:MAXIMUM 10 sets the number of files to saved to ten.

[SENSe]:ACQuisition:RECord:FILE:NAME:BASE

Sets or queries the base file name that is used for all data recordings. The base name is appended with additional information, creating unique file names.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:FILE:NAME:BASE <base_name>
[SENSe]:ACQuisition:RECord:FILE:NAME:BASE?
```

Arguments

<base_name>::=<"string"> specifies the base file name used for all data recordings.

Examples

SENSe:ACQUISITION:RECORD:FILE:NAME:BASE "DataFile" sets the base name to DataFile.

[SENSe]:ACQuisition:RECord:FILE:SIZE? (Query Only)

Queries the expected recording file size in bytes. This item is only displayed in the UI when Record Time is enabled.

Group

Sense commands

Syntax

`[SENSe]:ACQuisition:RECord:FILE:SIZE?`

Arguments

None

Returns

`<NRf>` in mseconds.

Examples

`SENSe:ACQUISITION:RECORD:FILE:SIZE?` might return `10`, indicating that the recorded file size is expected to be 10 ms.

[SENSe]:ACQuisition:RECord:FILE:STRucture

Sets or queries the file structure to use for the recorded data files.

Conditions

Requires an RSA 306, 306B, 500A series, 600A series, of 7100A be connected.

Group

Sense commands

Syntax

`[SENSe]:ACQuisition:RECord:FILE:STRucture { RAW | FORM }`

Arguments

`RAW`: Unformatted files are created. Two files are created for each recording, a header file (.r3h) and the data file (.r3a).

`FORMatted`: Formatted files are created, ending with a .r3f suffix.

MDSCombined: Midas 2.0 (CDIF) files are created.

MDSDetached: Midas 2.0 Detached (CDIF+DET) files are created.

The contents of these file types is described in the API Reference manual (077-1031-XX) available on the SignalVu-PC Software and Documentation Flash Drive or on tek.com.

Examples

`SENSe:ACQUISITION:RECORD:FILE:STRUCTURE FORMATTED` sets the file format to Formatted.

[SENSe]:ACQuisition:RECord:RESults? (Query Only)

Queries the recording status.

Group

Sense commands

Syntax

`[SENSe]:ACQuisition:RECord:RESults?`

Arguments

None

Returns

`<Number files completed>,<bytes in file>,<percentage in file>,<Acquisition Data Status>`

Where

`<Number files completed>::<NR1>` Number of files completed.

`<bytes in file>::<NR1>` Number of bytes written to current file.

`<percentage in file>::<NRf>` Percentage of current file written.

`<Acquisition Data Status>::<NR1>` Acquisition data status. This is the overall acquisition data status since recording started.

The following hexadecimal values indicate acquisition data status.

Description	Value
ADC Overrange	0x1
Acquisition Data Lost	0x20
IF Power Overrange	0x100000

Examples

`SENSe:ACQUISITION:RECORD:RESULTS?` might return `2,2400,50,0x1` indicating that 2 files were completed, 2400 total bytes, 50% completed, and that there is ADC overrange.

[SENSe]:ACQuisition:RECord:STARt (No Query Form)

Starts the data recording. The Record to disk must the set to Record now. See the command `[:SENSe]:ACQuisition:RECord:TYPE`. See the command `[:SENSe]:ACQuisition:RECord:FILE:LOCation` to specify the file name and location.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

`[SENSe]:ACQuisition:RECord:STARt`

Arguments

None

Examples

SENSe:ACQUISITION:RECORD:START starts the data recording.

[SENSe]:ACQuisition:RECord:STOP (No Query Form)

Starts the data recording. The Record to disk must the set to Record now. See the command [:SENSe]:ACQuisition:RECord:TYPE. See the command [:SENSe]:ACQuisition:RECord:FILE:LOCation to specify the file name and location.

Conditions

Requires an RSA 306, 306B, 500A series, or 600A series be connected.

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:RECord:STOP
```

Arguments

None

Examples

SENSe:ACQUISITION:RECORD:STOP stops the data recording.

[SENSe]:ACQuisition:RECord:TYPE

Sets or queries when the recording starts streaming data to the specified file.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

```
Syntax
[SENSe]:ACQuisition:RECord:TYPE { NOW | TRIGger }
```

Arguments

NOW starts the recording immediately when Start is enabled. See the command [:SENSe]:ACQuisition:RECord:STARt (on page 2001).

TRIGger starts the recording when an appropriate trigger signal is received and Triggering is set to Triggered. See the command :TRIGger[:SEQuence][:STATus] (on page 2786).

Examples

SENSe:ACQUISITION:RECORD:TYPE NOW sets the Record to disk setting to Record now.

[SENSe]:ACQuisition:SAMPles

Sets or queries the acquisition samples (number of samples acquired over the acquisition time) when [SENSe]:ACQuisition:MODE is set to SAMPles.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:SAMPles <value>
[SENSe]:ACQuisition:SAMPles?
```

Arguments

`<value>::<NR1>` specifies the acquisition samples. Range: 2 to 1 G samples..

Examples

`SENSe:ACQUISITION:SAMPLES 1114` sets the acquisition samples to 1114.

[SENSe]:ACQuisition:SEConds

Sets or queries the acquisition length (time over which the acquisition occurs) when `[SENSe]:ACQuisition:MODE` is set to LENGth.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ACQuisition:SEConds <value>
[SENSe]:ACQuisition:SEConds?
```

Arguments

`<value>::<NRf>` specifies the acquisition length.

Examples

`SENSe:ACQUISITION:SAMPLES 12.5ms` sets the acquisition length to `12.5 ms`.

[SENSe]:{AM|FM|PM}:{BANDwidth|BWIDth}:MEASurement

Sets measurement bandwidth for the AM, FM, or PM demodulation to analyze.

Conditions

Measurement views: AM, FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{AM|FM|PM}:{BANDwidth|BWIDth}:MEASurement <value>
[SENSe]:{AM|FM|PM}:{BANDwidth|BWIDth}:MEASurement?
```

Related Commands

FETCh:{AM|FM|PM}? (on page 1112)

READ:AM:RESult? (on page 1608)

READ:FM:RESult? (on page 1702)

READ:PM:RESult? (on page 1808)

Arguments

`<value>::<NRf>` specifies the demodulation bandwidth for the specified modulation type.

Examples

`SENSe:AM:BANDwidth:MEASurement 1e6` sets the amplitude demodulation bandwidth to `1 MHz`.

[SENSe]:{AM|FM|PM}:CLEar:RESults (No Query Form)

Clear results in the AM/FM/PM measurement.

Conditions

Measurement views: AM, FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{AM|FM|PM}:CLEar:RESults
```

Arguments

None

Examples

`SENSe:AM:CLEAR:RESULTS` clears results in the AM measurement.

[SENSe]:{AM|FM|PM}:{MTPoints|MAXTracepoints}

Sets or queries the maximum trace points in the AM/FM/PM measurement.

Conditions

Measurement views: AM, FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{AM|FM|PM}:{MTPoints|MAXTracepoints} { ONEK | TENK | HUNDredk | NDECimate | NEVerdecimate }
[SENSe]:{AM|FM|PM}:{MTPoints|MAXTracepoints}?
```

Arguments

The following table lists the arguments.

Argument	Maximum trace points
ONEK	1k
TENK	10k
HUNDredk	100k
NDECimate or NEVerdecimate	Never decimate

Examples

`SENSe:AM:MTPOINTS ONEK` selects the maximum trace points of 1000 in the AM measurement.

[SENSe]:AM:DETect:AMPLitude

Sets or queries the carrier amplitude detection method used to determine the 0% reference modulation in the AM measurement.

Conditions

Measurement views: AM

Group

Sense commands

Syntax

```
[SENSe]:AM:DETect:AMPLitude { AVERage | MEDian }
[SENSe]:AM:DETect:AMPLitude?
```

Arguments

`AVERage` defines the 0% reference modulation as the average amplitude in the analysis range (default).

`MEDian` defines the 0% reference modulation as the median amplitude ([(maximum)+(minimum)]/2) in the analysis range.

Examples

`SENSe:AM:DETECT:AMPLITUDE AVERage` defines the 0% modulation as the average amplitude in the analysis range.

[SENSe]:ANALysis:ADVanced:DITHer

Determines whether to enable or disable dithering, or set it automatically.

Dither is a random low-level signal consisting of white noise of one quantizing level peak-to-peak amplitude which may be added to an analog signal prior to sampling for the purpose of minimizing quantization error.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:ADVanced:DITHer { AUTO | ON | OFF }
[SENSe]:ANALysis:ADVanced:DITHer?
```

Arguments

AUTO specifies that the dither is set automatically.

ON enables dithering.

OFF disables dithering.

Examples

SENSe:ANALYSIS:ADVANCED:DITHER ON enables dithering.

[SENSe]:ANALysis:ADVanced:DITHer:HWARe:STATus? (Query Only)

Returns the dithering hardware status.

Conditions

Measurement views: All

Group

Sense commands

Syntax

[SENSe]:ANALysis:ADVanced:DITHer:HWARe:STATus?

Arguments

None

Returns

One of the following status information.

Dithering status

Status	Description
DUNaligned	Dithering is disabled and unaligned.
ON	Dithering is enabled.
OFF	Dithering is disabled.

Examples

SENSE:ANALYSIS:ADVANCED:DITHER:HWARE:STATUS? might return OFF, indicating that the dithering is disabled.

[:SENSe]:ANALysis:BANDwidth:FILTer:MODE {set and query}

Sets or queries the measurement bandwidth filter mode.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
SENSe:ANAlysis:BANDwidth:FILTer:MODE {0|1|TRUE|FALSE}
SENSe:ANAlysis:BANDwidth:FILTer:MODE? (Query)
```

Returns

`0` is used to change the 'Measurement Bandwidth Filter' checkbox state from unchecked to checked.

`1` is used to change 'Measurement Bandwidth Filter' checkbox state from checked to unchecked.

Examples

`SENSe:ANAlysis:BANDwidth:FILTer:MODE 0` changes 'Measurement Bandwidth Filter' checkbox state to unchecked.

[SENSe]:ANALysis:LENGth[:SOURce<z>]

Sets or queries the analysis length. Programming a specified length sets `[SENSe]:ANALysis:AUTO OFF`.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:LENGth[:SOURce<z>] <value>
[SENSe]:ANALysis:LENGth[:SOURce<z>]?
```

Related Commands

[SENSe]:ANALysis:LENGth[:SOURce2]:AUTO (on page 2008)

Arguments

`<value>::<NRf>` specifies the analysis length.

Range: 10 ns to [(acquisition length) - 400 ns].

If [(analysis start) + (analysis length)] > [(acquisition length) - 400 ns], the actual analysis length is reduced to [(acquisition length) - 200 ns].

Examples

`SENSe:ANALysis:LENGth:SOURce2 25.625 µs` sets the analysis length of Source 2 to 25.625 µs.

[SENSe]:ANALysis:LENGth[:SOURce<z>]:ACTual? (Query only)

Queries the actual analysis length.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:LENGth[:SOURce<z>]:ACTual?
```

Returns

<NRf> Actual analysis length in seconds.

Examples

SENSe:ANALysis:LENGth:SOURce2:ACTual? might return 25.625E-6, indicating that the actual analysis length is 25.625 µs.

[SENSe]:ANALysis:LENGth[:SOURce<z>]:AUTO

Determines whether to set the analysis length automatically or manually.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:LENGth:SOURce<z>:AUTO { OFF | ON | 0 | 1 }
[SENSe]:ANALysis:LENGth:SOURce<z>:AUTO?
```

Arguments

OFF or 0 sets the analysis length manually, using the [SENSe]:ANALysis:LENGth command.

ON or 1 sets the analysis length automatically.

Examples

SENSe:ANALysis:LENGth:SOURce2:AUTO ON sets the analysis length of Source 2 automatically.

[SENSe]:ANALysis:REFerence[:SOURce<z>]

Sets or queries the analysis time reference.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:REFerence:SOURCE<z> { ACQSTART | TRIGGER }
[SENSe]:ANALysis:REFerence:SOURCE<z>?
```

Arguments

`ACQSTART` specifies the acquisition start as the time zero reference.

`TRIGGER` specifies the trigger point as the time zero reference.

Examples

`SENSe:ANALysis:REFerence:SOURCE2 ACQSTART` specifies the acquisition start as the analysis time reference for Source 2.

[SENSe]:ANALysis:STARt[:SOURce<z>]

Sets or queries the analysis offset time. Programming a specified offset time sets `[SENSe]:ANALysis:STARt:AUTO OFF`.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:STARt:SOURCE<z> <value>
[SENSe]:ANALysis:STARt:SOURCE<z>?
```

Related Commands

[SENSe]:ANALysis:LENGth[:SOURCE<z>] (on page 2008)

[SENSe]:ANALysis:STARt[:SOURCE<z>]:AUTO (on page 2009)

Arguments

`<value>::<NRf>` specifies the analysis offset time.

Range: 0 to [(acquisition length) - 200 ns].

If [(analysis start) + (analysis length)] > [(acquisition length) - 400 ns], the actual analysis length is reduced to [(acquisition length) - 200 ns].

Examples

`SENSe:ANALysis:STARt:SOURCE2 23.5µs` sets the analysis offset to 23.5 µs.

[SENSe]:ANALysis:STARt[:SOURce<z>]:AUTO

Determines whether to set the analysis offset automatically or manually.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANALysis:STARt:SOURCE<z>:AUTO { OFF | ON | 0 | 1 }
[SENSe]:ANALysis:SOURCE<z>:STARt:AUTO?
```

Arguments

`OFF` or `0` sets the analysis offset manually, using the `[SENSe]:ANALysis:STARt` command.

`ON` or `1` sets the analysis offset automatically.

Examples

`SENSe:ANALysis:STARt:SOURCE1:AUTO ON` sets the analysis offset automatically.

[SENSe]:ANSPectrum:STARt:AUTO:METHod

Sets or queries the method used for computing auto analysis and spectrum offsets when `[SENSe]:ANALysis:REFerence` is set to TRIGger.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ANSPectrum:STARt:AUTO:METHod { INCLude | LEGacy }
[SENSe]:ANSPectrum:STARt:AUTO:METHod?
```

Arguments

`INCLude` includes the trigger point.

`LEGacy` starts a trigger point.

Examples

`SENSe:ANSPECTRUM:START:AUTO:METHOD INCLUDE` includes the trigger point.

[SENSe]:AUDio:AVERage:COUNt

Sets or queries the number of harmonics to average in the audio measurement.

The range is from 2 to 20.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:AVERage:COUNt <average_value>
[SENSe]:AUDio:AVERage:COUNt?
```

Arguments

`<average_value> ::= <NR1>` the number of harmonics to average.

Examples

`SENSe:AUDIO:AVERAGE:COUNT 10` sets the number of harmonics to average to 10.

[SENSe]:AUDio:AVERage:ENABle

Enables or disables averaging of harmonics in the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:AVERage:ENABle { OFF | ON | 0 | 1 }
[SENSe]:AUDio:AVERage:ENABle?
```

Arguments

`OFF` or `0` turns averaging off.

`ON` or `1` turns averaging on.

Examples

`SENSe:AUDIO:AVERAGE:ENABLE ON` turns on averaging of harmonics in the audio measurement.

[SENSe]:AUDio:BANDwidth|BWIDth

Sets or queries the audio measurement bandwidth.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:BANDwidth|BWIDth <value>
[SENSe]:AUDio:BANDwidth|BWIDth?
```

Arguments

`<value> ::= <NR3>` the audio measurement bandwidth value.

Examples

`SENSe:AUDIO:BANDWIDTH|BWIDTH 20.5E+3` sets the audio measurement bandwidth to 20.5 kHz.

[SENSe]:AUDio:BANDwidth|BWIDth:RESolution

Sets or queries the resolution bandwidth for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:BANDwidth|BWIDth:RESolution <value>
[SENSe]:AUDio:BANDwidth|BWIDth:RESolution?
```

Arguments

`<value> ::= <NR3>` the resolution bandwidth value.

Examples

`SENSe:AUDIO:BANDWIDTH|BWIDTH:RESOLUTION 40` sets the resolution bandwidth to 40 Hz.

[SENSe]:AUDio:BANDwidth|BWIDth:RESolution:AUTO

Determines whether to set the resolution bandwidth frequency automatically or manually.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:BANDwidth|BWIDth:RESolution:AUTO { OFF | ON | 0 | 1 }
[SENSe]:AUDio:BANDwidth|BWIDth:RESolution:AUTO?
```

Arguments

`OFF` or `0` specifies the resolution bandwidth is set manually.

`ON` or `1` specifies the resolution bandwidth is set automatically.

Examples

`SENSe:AUDIO:BANDWIDTH|BWIDTH:RESOLUTION:AUTO ON` sets the resolution bandwidth automatically.

[SENSe]:AUDio:BANDwidth|BWIDth:RESolution:SHAPe

Sets or queries the shape of the resolution bandwidth for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:BANDwidth|BWIDth:RESolution:SHAPe { FLATtop | KAISer }
[SENSe]:AUDio:BANDwidth|BWIDth:RESolution:SHAPe?
```

Arguments

`FLATtop` sets the resolution bandwidth shape to Flattop.

`KAISer` sets the resolution bandwidth shape to Kaiser.

Examples

`SENSe:AUDIO:BANDWIDTH|BWIDTH:RESOLUTION:SHAPE FLATtop` sets the resolution bandwidth to Flattop for the audio measurement.

[SENSe]:AUDio:CARRier:OFFSet

Sets or queries the carrier frequency offset. This selection is available for FM or PM measurements.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:CARRier:OFFSet <value>
[SENSe]:AUDio:CARRier:OFFSet?
```

Arguments

`<value> ::= <NR3>` the carrier frequency offset value.

Returns

<NR3>

Examples

`SENSe:AUDIO:CARRIER:OFFSET 422.5` sets the carrier frequency offset to 422.5 Hz.

[SENSe]:AUDio:CARRier:OFFSet:AUTO

Determines whether to set the carrier frequency error automatically or manually. This selection is available FM or PM measurements.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:CARRier:OFFSet:AUTO { OFF | ON | 0 | 1 }
[SENSe]:AUDio:CARRier:OFFSet:AUTO?
```

Arguments

OFF or 0 specifies the carrier frequency error is set manually.

ON or 1 specifies the carrier frequency error is set automatically.

Examples

SENSe:AUDIO:CARRIER:OFFSET:AUTO ON sets the carrier frequency error automatically.

[SENSe]:AUDio:DEMod:MUTE

Sets or queries the mute setting for the audio demodulation. Enabling Mute inhibits the audio from playing out through the PC speakers.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:AUDio:DEMod:MUTE { OFF | ON | 0 | 1 }
```

Arguments

ON or 1 enables the Mute setting for audio demodulation.

OFF or 0 disables the Mute setting for audio demodulation.

Returns

ON or 1 means that the Mute setting for audio demodulation is enabled.

OFF or 0 means that the Mute setting for audio demodulation is disabled.

Examples

SENSe:AUDIO:DEMOD:MUTE 1 enables the audio demodulation mute setting, inhibiting the audio signal from playing out through the PC speakers.

[SENSe]:AUDio:DEMod[:STATe]

Sets or queries the audio demodulation state.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:AUDio:DEMod[:STATe] { 0 | 1 }
```

Arguments

1 starts the demodulation.

0 stops the demodulation.

Returns

1 means the demodulation is started.

0 means the demodulation is stopped.

Examples

SENSe:AUDIO:DEMOD[:STATE] 1 starts the demodulating the audio signal.

[SENSe]:AUDio:DEMod:STReam:ACTivate

Sets or queries the Stream to File function. When checked, anytime the Run button is pressed, the audio stream-to-file begins.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:AUDio:DEMod:STReam:ACTivate { OFF | ON | 0 | 1 }
[SENSe]:AUDio:DEMod:STReam:ACTivate?
```

Arguments

ON or 1 enables the stream to file function.

OFF or 0 disables the stream to file function.

Returns

ON or 1 means the stream to file function is enabled.

OFF or 0 means the stream to file function is disabled.

Examples

SENSe:AUDIO:DEMOD:STREAM:ACTIVATE 1 enables (activates) the audio streaming function.

SENSe:AUDIO:DEMOD:STREAM:ACTIVATE? might return 0, indicating the audio streaming function is deactivated.

[SENSe]:AUDio:DEMod:STReam[:FILE] (No Query Form)

Sets the file name and file location of the audio file when streaming to disc.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:AUDio:DEMod:STReam[:FILE] <file>
```

Arguments

<file_name>::=<string> specifies the file name and location. The file extension is .wav. You can omit the extension.

You can use the absolute path to specify the file name. For example, specify the SAMPLE1 file in the My Documents folder on the C drive as "C:\My Documents\Audio1".

If you omit the directory path, the default path is used, which is C:\SignalVu-PC Files\Sample Data Records, initially.

Examples

SENSe:AUDIO:DEMOD:STREAM[:FILE] "C:\SignalVu-PC Files\Sample Data Records\Audio1" saves the streamed audio file Audio1 to the specified location.

[SENSe]:AUDio:DEMod:TYPE

Sets or queries both the audio signal demodulation type and bandwidth.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

[SENSe]:AUDio:DEMod:TYPE { AM8K | FM8K | FM13K | FM75K | FM200K }

Related Commands

Arguments

AM8K

FM8K

FM13K

FM75K

FM200K

Returns

Same as arguments.

Examples

SENSe:AUDIO:DEMOD:TYPE AM8K sets the audio demodulation type to AM and the bandwidth to 8 KHz.

SENSe:AUDIO:DEMOD:TYPE? might return AM8K.

[SENSe]:AUDio:DEMod:VOLume

Sets or queries the volume of the demodulated audio signal when played out through the PC speakers.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Sense commands

Syntax

```
[SENSe]:AUDio:DEMod:VOLume <value>
[SENSe]:AUDio:DEMod:VOLume?
```

Arguments

`<value>::=<NR2>` the value of relative volume setting.

Range = 0.0 to 1.0.

Examples

`SENSe:AUDIO:DEMOD:VOLUME 1.0` sets the volume output to maximum.

[SENSe]:AUDio:FILTer:DEEMphasis

Sets or queries the de-emphasis filter type.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:DEEMphasis { U25 | U50 | U75 | U750 | USER}
[SENSe]:AUDio:FILTer:DEEMphasis?
```

Arguments

`U25` specifies the 25 µs filter.

`U50` specifies the 50 µs filter.

`U75` specifies the 75 µs filter.

`U750` specifies the 750 µs filter.

`USER` specifies a user-defined filter.

Examples

`SENSe:AUDIO:FILTER:DEEMPHASIS U50` specifies the 50 µs filter for the audio measurement.

[SENSe]:AUDio:FILTer:DEEMphasis:ENABle

Enables or disables the de-emphasis filter for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:DEEMphasis:ENABle { OFF | ON | 0 | 1 }
[SENSe]:AUDio:FILTer:DEEMphasis:ENABle?
```

Arguments

`OFF` or `0` turns off the de-emphasis filter.

`ON` or `1` turns on the de-emphasis filter.

Examples

`SENSe:AUDIO:FILTER:DEEMPHASIS:ENABLE ON` turns on the de-emphasis filter.

[SENSe]:AUDio:FILTer:DEEMphasis:USER

Sets or queries a user-defined de-emphasis audio filter.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:DEEMphasis:USER <value>
[SENSe]:AUDio:FILTer:DEEMphasis:USER?
```

Arguments

`<value> ::= <NR3>` the value of the user defined filter.

Examples

`SENSe:AUDIO:FILTER:DEEMPHASIS:USER 50.0E-6` sets the user-defined de-emphasis filter to 50 µs.

[SENSe]:AUDio:FILTer:HPF

Sets or queries the high-pass filter type.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:HPF { H20 | H50 | H300 | H400 | USER }
[SENSe]:AUDio:FILTer:HPF?
```

Arguments

`H20` specifies the 20 Hz filter.

`H50` specifies the 50 Hz filter.

`H300` specifies the 300 Hz filter.

`H400` specifies the 400 Hz filter.

`USER` specifies a user-defined filter.

Examples

`SENSe:AUDIO:FILTER:HPF H300` specifies the 300 Hz filter for the audio measurement.

[SENSe]:AUDio:FILTer:HPF:ENABle

Enables or disables the high-pass audio filter for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:HPF:ENABle { OFF | ON | 0 | 1 }
[SENSe]:AUDio:FILTer:HPF:ENABle?
```

Arguments

`OFF` or `0` turns the high-pass audio filter off.

`ON` or `1` turns the high-pass audio filter on.

Examples

`SENSe:AUDIO:FILTER:HPF:ENABLE ON` turns the high-pass audio filter on.

[SENSe]:AUDio:FILTer:HPF:USER

Sets or queries a user-defined high-pass audio filter.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:HPF:USER <value>
[SENSe]:AUDio:FILTer:HPF:USER?
```

Arguments

`<value> ::= <NR3>` the value of the user defined filter.

Examples

`SENSe:AUDIO:FILTER:HPF:USER 50` sets the user-defined high-pass filter to 50 Hz.

[SENSe]:AUDio:FILTer:LPF

Sets or queries the low-pass filter type.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:LPF { H300 | H3K | H15K | H30K | H80K | H300K | USER }
[SENSe]:AUDio:FILTer:LPF?
```

Arguments

`H300` specifies the 300 Hz filter.

`H3K` specifies the 3 kHz filter.

`H15` specifies the 15 kHz filter.

`H30K` specifies the 30 kHz filter.

`H80K` specifies the 80 kHz filter.

`H300K` specifies the 300 kHz filter.

`USER` specifies a user-defined filter.

Examples

`SENSe:AUDIO:FILTER:LPF H300` specifies the 300 Hz filter for the audio measurement.

[SENSe]:AUDio:FILTer:LPF:ENABle

Enables or disables the low-pass filter for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:LPF:ENABle { OFF | ON | 0 | 1 }
[SENSe]:AUDio:FILTer:LPF:ENABle?
```

Arguments

`OFF` or `0` turns the low-pass audio filter off.

`ON` or `1` turns the low-pass audio filter on.

Examples

`SENSe:AUDIO:FILTER:LPF:ENABLE ON` turns the low-pass filter on.

[SENSe]:AUDio:FILTer:LPF:USER

Sets or queries a user-defined low-pass audio filter.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:LPF:USER <value>
[SENSe]:AUDio:FILTer:LPF:USER?
```

Arguments

`<value> ::= <NR3>` the value of the user defined filter.

Examples

`SENSe:AUDIO:FILTER:LPF:USER 1500` sets the user-defined low-pass filter to 1.50 kHz.

[SENSe]:AUDio:FILTer:MODE:PREDefined

Selects a predefined audio filter or a filter stored on the instrument file system.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:MODE:PREDefined { OFF | ON | 0 | 1 }
[SENSe]:AUDio:FILTer:MODE:PREDefined?
```

Arguments

`OFF` or `0` specifies the predefined filter on the file system. The file is specified by the `[SENSe]:AUDio:FILTer:SOURce?` command.

`ON` or `1` specifies the filter will be one of the selected predefined filters.

Examples

`SENSe:AUDIO:FILTER:MODE:PREDEFINED ON` specifies the filter will be one of the predefined filters.

[SENSe]:AUDio:FILTer:SOURce? (Query Only)

Queries the measurement filter from the user-defined source file.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:SOURce?
```

Related Commands

[SENSe]:AUDio:FILTer:MODE:PREDefined (on page 2021)

Arguments

None

Returns

`<file name> ::= <string>` the name of the predefined filter.

Examples

`SENSe:AUDIO:FILTER:SOURCE? AUD-Test3` loads the predefined filter “AUD-Test3.”

[SENSe]:AUDio:FILTer:STANdard

Sets or queries the Standard audio filter.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:STANdard { CCITT | CMSG }
[SENSe]:AUDio:FILTer:STANdard?
```

Arguments

`CCITT` specifies the CCITT Standard filter.

`CMSG` specifies the CMSG Standard filter.

Examples

`SENSe:AUDIO:FILTER:STANDARD CCITT` specifies the CCITT Standard filter.

[SENSe]:AUDio:FILTer:STANdard:ENABle

Enables or disables a Standard filter for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FILTer:STANdard:ENABle { OFF | ON | 0 | 1 }
[SENSe]:AUDio:FILTer:STANdard:ENABle?
```

Arguments

`OFF` or `0` turns the standard filter off.

`ON` or `1` turns the standard audio filter on.

Examples

`SENSe:AUDIO:FILTER:STANDARD:ENABLE ON` turns the Standard filter on.

[SENSe]:AUDio:FREQuency

Sets or queries the reference audio frequency.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FREQuency <value>
[SENSe]:AUDio:FREQuency?
```

Arguments

`<value> ::= <NR3>` the reference audio frequency.

Examples

`SENSe:AUDIO:FREQUENCY?` might return `5.8240000000E+3` indicating that the reference audio frequency is 5.824 kHz.

[SENSe]:AUDio:FREQuency:AUTO

Determines whether to set the reference audio frequency automatically or manually.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:FREQuency:AUTO { OFF | ON | 0 | 1 }
[SENSe]:AUDio:FREQuency:AUTO?
```

Arguments

`OFF` or `0` specifies the audio reference frequency is set manually.

`ON` or `1` specifies the audio reference frequency is set automatically.

Examples

`SENSe:AUDIO:FREQUENCY:AUTO ON` sets the audio reference frequency automatically.

[SENSe]:AUDio:HNOise:ENABle

Enables or disables the Hum and Noise information in the Audio Summary display.

Conditions

Measurement views: Audio Summary

Group

Sense commands

Syntax

```
[SENSe]:AUDio:HNOise:ENABle { OFF | ON | 0 | 1 }
[SENSe]:AUDio:HNOise:ENABle?
```

Related Commands

[SENSe]:AUDio:HNOise:REFerence (on page 2024)

Arguments

`OFF` or `0` turns off the Hum and Noise information in Audio Summary display.

`ON` or `1` turns on the Hum and Noise information in the Audio Summary display.

Examples

`SENSe:AUDIO:HNOISE:ENABLE OFF` turns off the Hum and Noise information in the Audio Spectrum display.

[SENSe]:AUDio:HNOise:REFerence (No Query Form)

Captures the current Hum and Noise information in the Audio Summary display.

Conditions

Measurement views: Audio Summary

Group

Sense commands

Syntax

```
[SENSe]:AUDio:HNOise:REFerence
```

Related Commands

[SENSe]:AUDio:HNOise:ENABle (on page 2023)

Arguments

None

Examples

`SENSe:AUDIO:HNOISE:REFERENCE` shows the current Hum and Noise information in the Audio Summary display.

[SENSe]:AUDio:SIGnal:TYPE

Sets or queries the audio signal type.

The signal type selection determines the available selections for the `[SENSe]:AUDio:UNITs` command.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:SIGnal:TYPE { AM | FM | DIRect | PM }
[SENSe]:AUDio:SIGnal:TYPE?
```

Related Commands

[SENSe]:AUDio:UNITs (on page 2026)

Arguments

`AM` sets the signal type to amplitude modulation.

`FM` sets the signal type to frequency modulation.

`DIRect` sets the signal type to direct modulation.

`PM` sets the signal type to pulse modulation.

Returns

Examples

`SENSe:AUDIO:SIGNAL:TYPE FM` sets the signal type to FM, frequency modulation for the audio spectrum measurement.

[SENSe]:AUDio:SPECtrum:CLEar:RESults (No Query Form)

Clears the results of the audio spectrum measurement.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:SPECtrum:CLEar:RESults
```

Arguments

None

[SENSe]:AUDio:SPECtrum:POINts:COUNt

Sets or queries the number of trace points acquired for the audio spectrum display.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:SPECtrum:POINts:COUNt { P801 | P2401 | P4001 | P8001 | P10401 }
[SENSe]:AUDio:SPECtrum:POINts:COUNt?
```

Arguments

`P801` sets the number of sample points to 801.

`P2401` sets the number of sample points to 2401.

`P4001` sets the number of sample points to 4001.

`P8001` sets the number of sample points to 8001.

`P10401` sets the number of sample points to 10401.

Examples

`SENSe:AUDIO:SPECTRUM:POINTS:COUNT P2401` sets the number of sample points to 2401 in the audio spectrum display.

[SENSe]:AUDio:UNITs

Sets or queries the units of the audio spectrum measurement.

The available selections depend on signal type.

Conditions

Measurement views: Audio Spectrum

Group

Sense commands

Syntax

```
[SENSe]:AUDio:UNITs { AM | AM2 | DBAM2 | HZ | HZ2 | DBHZ2 | RAD | RAD2 | DBRAD2 | DBM | DBV | VOLTs
    | WATTs }
[SENSe]:AUDio:UNITs?
```

Related Commands

[SENSe]:AUDio:SIGnal:TYPE (on page 2024)

Arguments

The following table lists the arguments.

Argument	Unit	Signal type
DBM	dBm	Direct
DBV	dBV	
VOLTs	Volts	
WATTs	Watts	
AM	am	AM
AM2	am^2	
DBAM2	$dBam^2$	

Argument	Unit	Signal type
HZ	Hz	FM
HZ2	Hz[22]	
DBHZ2	dBHz[2]	
RAD	rad	PM
RAD2	rad[2]	
DBRAD2	dBrad[2]	

Examples

`SENSe:AUDIO:UNITS VOLTs` sets the units to volts for the Direct signal type.

[SENSe]:AVTime[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Amplitude versus Time for a selected Measurement view number.

Conditions

Measurement views: Amplitude versus Time

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:AVTime[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:AVTIME:MEASVIEW1:SELECTED:SOURCE 2` queries the Source for Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:SPAN:LINK

Sets or queries the frequency span in the Amplitude versus Time measurement. Programming a specified span disables the `[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth}` setting.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:SPAN:LINK <value>
[SENSe]:AVTime[:MEASview<y>]:SPAN:LINK?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

OFF or 0 specifies that Link to Span is not checked

ON or 1 specifies that Link to Span is checked

Examples

SENSe:AVTIME:MEASVIEW1:SPAN:LINK? the frequency span link on Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth}

Sets or queries the time-domain bandwidth filter in the Amplitude versus Time measurement. Programming a specified bandwidth disables the [SENSe]:AVTime[:MEASview<y>]:SPAN setting.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth} <value>
[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth}?
```

Arguments

<value>::<NRf> specifies the filter bandwidth.

Range: 1 Hz to 20 MHz (Standard) / 60 MHz (Option 110).

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:AVTIME:MEASVIEW1:BANDWIDTH 10MHz sets the filter bandwidth to 10 MHz on Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth}:ACTual? (Query Only)

Queries the actual time-domain bandwidth in the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth}:ACTual?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<NRf> The actual time-domain bandwidth in Hz.

Examples

SENSe:AVTIME:MEASVIEW1:BANDWIDTH:ACTUAL? might return 20E+6, indicating that the actual time-domain bandwidth is 20 MHz on Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:CLEar:RESults
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:AVTIME:MEASVIEW1:CLEAR:RESULTS restarts multi-trace functions on Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta
| GRAY | TEMPerature | SPECtral}
```

```
[SENSe]:AVTime[:MEASview<y>]:COLor?
```

Arguments

The following table lists the arguments:

Argument	Palette
RED	Red
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray
TEMPerature	Temperature
SPECtral	Spectral

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:AVTIME:COLOR TEMPERATURE` selects the temperature color palette.

[SENSe]:AVTime[:MEASview<y>]:COLor:MAXimum

Sets or queries the maximum value of the color axis in the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:COLor:MAXimum <value>`

`[SENSe]:AVTime[:MEASview<y>]:COLor:MAXimum?`

Arguments

`<value>::=<NRf>` specifies the maximum value of the color axis.

Range: The minimum value to 100%.

The minimum value is set using the `[SENSe]:AVTime[:MEASview<y>]:COLor:MINimum` command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:AVTIME:COLOR:MAXIMUM 90` sets the maximum value of the color axis to 90%.

[SENSe]:AVTime[:MEASview<y>]:COLor:MINimum

Sets or queries the minimum value of the color axis in the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:COLor:MINimum <value>`

`[SENSe]:AVTime[:MEASview<y>]:COLor:MINimum?`

Arguments

`<value>::=<NRf>` specifies the minimum value of the color axis.

Range: 0% to the maximum value.

The maximum value is set using the `[SENSe]:AVTime[:MEASview<y>]:COLor:MAXimum` command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:AVTIME:COLOR:MINIMUM 10` sets the minimum value of the color axis to 10%.

[SENSe]:AVTime[:MEASview<y>]:COLor:REVerse[:STATe]

Determines whether to reverse the color palette in the Amplitude versus Time view. When reversed, the highest density takes the color normally used for the lowest.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:COLor:REVerse[:STATe] {OFF | ON | 0 | 1}`

`[SENSe]:AVTime[:MEASview<y>]:COLor:REVerse[:STATe]?`

Arguments

`OFF` or `0` uses the color palette in its normal order.

ON or 1 reverses the color palette.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

SENSE:AVTIME:COLOR:REVERSE:STATE ON reverses the color palette.

[SENSe]:AVTime[:MEASview<y>]:MAXTracepoints

Sets or queries the maximum trace points in the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:MAXTracepoints { ONEK | TENK | HUNDredk | NEVerdecimate }
[SENSe]:AVTime[:MEASview<y>]:MAXTracepoints?
```

Arguments

ONEK sets the maximum trace points to 1 k.

TENK sets the maximum trace points to 10 k.

HUNDredk sets the maximum trace points to 100 k.

NEVerdecimate never decimates the trace points.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:AVTIME:MEASVIEW1:MAXTRACEPOINTS TENK sets the maximum trace points to 10 k on Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:METHod

Sets or queries the method to set the measurement bandwidth in the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

```
[SENSe]:AVTime[:MEASview<y>]:METHod { SPAN | TDBW }
[SENSe]:AVTime[:MEASview<y>]:METHod?
```

Arguments

SPAN specifies that the measurement bandwidth is set by the frequency span, using the [SENSe]:AVTime:SPAN command.

TDBW specifies that the measurement bandwidth is set by the time-domain bandwidth, using the [SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth} command.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:AVTIME:MEASVIEW1:METHOD SPAN specifies that the measurement bandwidth is set by the frequency span on Amplitude versus Time Measurement View 1.

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor

Sets or queries the ogram color scheme.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor?

Related Commands

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MAXimum (on page 2034)

Arguments

The following table lists the arguments:

Argument	Palette
RED	Red
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray

Argument	Palette
TEMPerature	Temperature
SPECtral	Spectral

Parameter <y> = 1 to 8 represents measurement view index. MEASview is optional and defaults to 1.

Returns

{RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}

Examples

SENSe:AVTime:MEASview1:OGRAm:COLor TEMPerature selects the temperature color palette.

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MAXimum

Sets or queries the maximum value of the color axis in the ogram.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MAXimum <value>

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MAXimum?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

<value>::=<NRf> specifies the maximum value of the color axis.

Range: -100 to +100 dBm.

Related Commands

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MINimum (on page 2034)

Returns

<NRf> specifies the maximum value of the color axis.

Examples

SENSe:AVTime:MEASview1:OGRAm:COLor:MAXimum 10 sets the maximum value of the color axis to 10 dBm.

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MINimum

Sets or queries the minimum value of the color axis in the ogram.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MINimum <value>`

`[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MINimum?`

Related Commands

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:MAXimum (on page 2034)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

`<value>::=` `<NRf>` specifies the minimum value of the color axis.

Range: -100 to +100 dBm.

Returns

<NRf> specifies the minimum value of the color axis.

Examples

`SENSe:AVTime:MEASview1:OGRAm:COLor:MINimum 10` sets the minimum value of the color axis to 10 dBm.

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:REVerse

Sets or queries reverse color scheme state.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:REVerse {OFF | ON | 0 | 1}`

`[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor:REVerse?`

Related Commands

[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor (on page 2033)

Arguments

`OFF` or `0` disables Reverse color scheme.

`ON` or `1` enables Reverse color scheme.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

`0` disables Reverse color scheme.

`1` enables Reverse color scheme.

Examples

`SENSe:AVTime:MEASview1:OGRAm:COLor:REVerse OFF` disables reverse color scheme.

[SENSe]:AVTime[:MEASview<y>]:PLOT

Sets or queries the Amplitude vs time display mode.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:PLOT {TRACE | OGRAM | SPLIT}`

`[SENSe]:AVTime[:MEASview<y>]:PLOT?`

Arguments

`TRACE` displays time plot .

`OGRAM` displays Ogram plot.

`SPLIT` displays both ogram and time plots.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

`{TRACE | OGRAM | SPLIT}`

Examples

`SENSe:AVTime:MEASview1:PLOT TRACE` sets plot type to TRACE (Time plot).

[SENSe]:AVTime[:MEASview<y>]:SPAN

Sets or queries the frequency span in the Amplitude versus Time measurement. Programming a specified span disables the `[SENSe]:AVTime[:MEASview<y>]:{BANDwidth|BWIDth}` setting.

Conditions

Measurement views: Amplitude versus Time

Group

Sense commands

Syntax

`[SENSe]:AVTime[:MEASview<y>]:SPAN <value>`
`[SENSe]:AVTime[:MEASview<y>]:SPAN?`

Arguments

<value>::<NRf> specifies the frequency span.

Range: 10 Hz to 40 MHz (Standard) / 110 MHz (Option 110)

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:AVTIME:MEASVIEW1:SPAN 5MHz sets the frequency span to 5 MHz on Amplitude versus Time Measurement View 1.

[SENSe]:BLUEtooth:ANALysis:LENGth

Sets or returns the analysis length in the Bluetooth displays. Programming a specified length sets [SENSe]:BLUEtooth:ANALysis:LENGth:AUTO to off.

Conditions

Measurement views: All Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:LENGth <value>
[SENSe]:BLUEtooth:ANALysis:LENGth?
```

Related Commands

[SENSe]:BLUEtooth:ANALysis:LENGth:AUTO (on page 2038)

Arguments

<value> ::= <NRf> the analysis length. The minimum range depends on the modulation type.

Examples

SENSe:BLUETOOTH:ANALYSIS:LENGTH 25.625E-6 sets the analysis length to 25.625 µs.

[SENSe]:BLUEtooth:ANALysis:LENGth:ACTual? (Query Only)

Sets the actual analysis length in the Bluetooth displays.

Conditions

Measurement views: All Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:LENGth:ACTual?
```

Arguments

None

Returns

<NR3> the actual analysis length in seconds.

Examples

SENSe:BLUETOOTH:ANALYSIS:LENGTH:ACTUAL? might return 25.625E-6, indicating that the actual analysis length is 25.625 µs.

[SENSe]:BLUEtooth:ANALysis:LENGth:AUTO

Sets or queries the length mode of the Bluetooth displays.

Conditions

Measurement views: All Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:LENGth:AUTO { OFF | ON | 0 | 1 }
[SENSe]:BLUEtooth:ANALysis:LENGth:AUTO?
```

Related Commands

[SENSe]:BLUEtooth:ANALysis:LENGth (on page 2037)

Arguments

OFF or 0 sets the analysis length manually, using the [SENSe]:BLUEtooth:ANALysis:LENGth command.

ON or 1 sets the analysis length automatically.

Examples

SENSe:BLUETOOTH:ANALYSIS:LENGTH:AUTO ON sets the analysis length mode automatically.

[SENSe]:BLUEtooth:ANALysis:MEAS[:BANDwidth|BWIDth]

Sets or returns the measurement bandwidth in the Bluetooth measurement.

Conditions

Measurement views: All Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:MEAS[:BANDwidth|BWIDth] <value>
[SENSe]:BLUEtooth:ANALysis:MEAS[:BANDwidth|BWIDth]?
```

Arguments

<value> ::= <NR3>, the measurement bandwidth.

Examples

SENSe:BLUETOOTH:ANALYSIS:MEAS[:BANDWIDTH|BWIDTH]? might return 6.400E+6 indicating the measurement bandwidth is 6.400 MHz.

[SENSe]:BLUEtooth:ANALysis:MEAS:SOURce

Sets or returns the analysis measurement source in the Bluetooth measurement.

Conditions

Measurement views: All Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:MEAS:SOURce { MANual | AUTO | LSP }
[SENSe]:BLUEtooth:ANALysis:MEAS:SOURce?
```

Arguments

MANual allows for manual selection of the measurement bandwidth. A typical use is setting a narrow measurement bandwidth on a small range of frequencies to examine one signal while rejecting the others that are present in a Spectrum graph.

AUTO automatically selects a measurement bandwidth. The measurement picks a bandwidth based on other parameter settings (such as symbol rate and modulation type).

LSP sets the measurement bandwidth to Link to Span. This allows you to use the Spectrum display to tune the frequency, view the signal, and then use the Span control to set the measurement bandwidth. This mode emulates legacy instruments.

Examples

SENSe:BLUETOOTH:ANALYSIS:MEAS:SOURCE? might return MAN indicating a manual selection of the bandwidth measurement.

[SENSe]:BLUEtooth:ANALysis:OFFSet

Sets or returns the Bluetooth symbol analysis offset.

Conditions

Measurement views: Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:OFFSet <value>
[SENSe]:BLUEtooth:ANALysis:OFFSet?
```

Arguments

<NR1> the symbol analysis offset as a percentage. The range is from 0 to 100%.

Examples

SENSe:BLUETOOTH:ANALYSIS:OFFSET -50 sets the symbol analysis of set to -50%.

[SENSe]:BLUEtooth:ANALysis:OFFSet:AUTO

Determines whether to set the carrier frequency error automatically or manually in the Bluetooth displays.

Conditions

Measurement views: Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:OFFSet:AUTO { OFF | ON | 0 | 1 }
[SENSe]:BLUEtooth:ANALysis:OFFSet:AUTO?
```

Arguments

`OFF` or `0` specifies the carrier frequency error is set manually.

`ON` or `1` specifies the carrier frequency error is set automatically.

Examples

`SENSe:BLUETOOTH:ANALYSIS:OFFSET:AUTO ON` sets the carrier frequency error automatically.

[SENSe]:BLUEtooth:ANALysis:TIMe:UNITs (No Query Form)

Sets the time units for the Bluetooth Constellation settings.

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:ANALysis:TIMe:UNITs {SEConds | SYMBols }
[SENSe]:BLUEtooth:ANALysis:TIMe:UNITs?
```

Arguments

`SEConds` sets the time units to seconds.

`SYMBols` sets the time units to symbols.

Examples

`SENSe:BLUETOOTH:ANALYSIS:TIME:UNITS` sets the time units to seconds.

[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):MODE

Sets or returns the measurement bandwidth mode for the Bluetooth measurements.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):MODE { MANual | AUTO |LSP }
[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):MODE?
```

Arguments

`MANual` allows for manual selection of the measurement bandwidth. A typical use is setting a narrow measurement bandwidth on a small range of frequencies to examine one signal while rejecting the others that are present in a Spectrum graph.

`AUTO` automatically selects a measurement bandwidth. The measurement picks a bandwidth based on other parameter settings (such as symbol rate and modulation type).

`LSP` sets the Measurement BW to Link to Span. This allows you to use the Spectrum display to tune the frequency, view the signal, and then use the Span control to set the measurement bandwidth. This mode emulates legacy instruments.

Examples

`SENSe:BLUETOOTH([:BANDWIDTH]|:BWIDTH):MODE AUTO` sets the bandwidth mode to automatically select a measurement bandwidth.

[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):TINTerval

Sets or returns the measurement bandwidth frequency span in the Bluetooth displays.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):TINTerval <value>
[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):TINTerval?
```

Arguments

`<value> ::= <NRf>` specifies the measurement bandwidth in MHz.

Returns

`<NRf>` the actual measurement bandwidth.

Examples

`SENSe:BLUETOOTH([:BANDWIDTH]|:BWIDTH):TINTERVAL?` might return `35.255E+6` indicating the bandwidth is 35.255 MHz.

[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):TINTerval:AUTO

Sets or returns the Bluetooth measurement bandwidth to Auto or to Manual.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):TINTerval:AUTO { 0 | 1 | OFF | ON }
[SENSe]:BLUEtooth([:BANDwidth]|:BWIDth):TINTerval:AUTO?
```

Arguments

`OFF` or `0` sets measurement bandwidth to Auto.

`ON` or `1` sets measurement bandwidth to Manual.

Examples

`SENSe:BLUETOOTH([:BANDWIDTH]|:BWIDTH):TINTERVAL:AUTO?` might return `1` indicating the measurement bandwidth is set to Auto.

[SENSe]:BLUEtooth:CONStellation:PREFs:GRATicule:SHOW

Show or hides the graticule state in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONStellation:PREFs:GRATicule:SHOW { OFF | ON | 0 | 1 }
[SENSe]:BLUEtooth:CONStellation:PREFs:GRATicule:SHOW?
```

Arguments

`OFF` or `0` hides the graticule in the display.

`ON` or `1` shows the graticule in the display.

Returns

`0` indicates the graticule is turned off.

`1` indicates the graticule is turned on.

Examples

`SENSe:BLUETOOTH:CONSTELLATION:PREFS:GRATICULE:SHOW ON` turns on the graticule in the display.

[SENSe]:BLUEtooth:CONStellation:PREFs:MARKERS:SHOW

Show or hides the marker readout in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONStellation:PREFs:MARKERS:SHOW { OFF | ON | 0 | 1 }
[SENSe]:BLUEtooth:CONStellation:PREFs:MARKERS:SHOW?
```

Arguments

`OFF` or `0` hides the marker readout in the display.

`ON` or `1` shows the marker readout in the display.

Returns

`0` indicates the marker readout is turned off.

`1` indicates the marker readout is turned on.

Examples

`SENSe:BLUETOOTH:CONSTELLATION:PREFS:GRATICULE:SHOW ON` turns on the marker readout in the display.

[SENSe]:BLUEtooth:CONStellation:PREFs:RADIx

Sets or returns the radix of the marker readout in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONStellation:PREFs:RADIx { Binary | Hex }
[SENSe]:BLUEtooth:CONStellation:PREFs:RADIx?
```

Arguments

`Binary` sets the marker readout to Binary.

`Hex` sets the marker readout to Hex.

Examples

`SENSe:BLUETOOTH:CONSTELLATION:PREFS:RADIX?` might return BINARY indicating the Marker readout radix is set to Binary.

[SENSe]:BLUEtooth:CONStellation:TRACE<x>:CONTent

Sets or returns the appearance of the specified trace (Trace 1 or Trace 2) in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONStellation:TRACE<x>:CONTent { Vectors | Points | Lines }
[SENSe]:BLUEtooth:CONStellation:TRACE<x>:CONTent?
```

Arguments

`Vectors` indicates the traces appear as vectors.

`Points` indicates the traces appear as a series of points.

`Lines` indicates the traces appear as lines.

Examples

`SENSe:BLUETOOTH:CONSTELLATION:TRACE1:CONTENT VECTORS` sets the Trace 1 to show as vectors in the display.

[SENSe]:BLUEtooth:CONStellation:TRACe<x>:FREEze

Sets or freezes the updates of the specified trace (Trace 1 or Trace 2) in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONStellation:TRACe<x>:FREEze { OFF | ON | 0 | 1 }
[SENSe]:BLUEtooth:CONStellation:TRACe<x>:FREEze?
```

Arguments

`OFF` or `0` normally updates the display of the specified trace.

`ON` or `1` stops updating the display of the specified trace.

Examples

`SENSe:BLUETOOTH:CONSTELLATION:TRACE1:FREEZE 1` freezes the updates of Trace 1.

[SENSe]:BLUEtooth:CONSTellation:TRACE<x>:POINtsPerSymbol

Sets or returns the number of points per symbol (how many points to use between symbols) for the specified trace (Trace 1 or Trace 2) in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONSTellation:TRACE<x>:POINtsPerSymbol { ONE |TWO | FOUR | EIGHt | SIXTeen |
   THIRtytwo }
[SENSe]:BLUEtooth:CONSTellation:TRACE<x>:POINtsPerSymbol?
```

Arguments

The number of points per symbol (1,2,4,8,16,32).

Examples

`SENSe:BLUETOOTH:CONSTELLATION:TRACE2:POINTSPERSYMBOL FOUR` sets the number of points per symbol for trace 2 to four.

[SENSe]:BLUEtooth:CONStellation:TRACe<x>:SHOW

Shows or hides the specified trace (Trace 1 or Trace 2) in the Bluetooth Constellation display.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:CONStellation:TRACe<x>:SHOW { OFF | ON | 0 | 1 }
[SENSe]:BLUEtooth:CONStellation:TRACe<x>:SHOW?
```

Arguments

`OFF` or `0` hides the specified trace in the display.

`ON` or `1` shows the specified trace in the display.

Examples

`SENSe:BLUETOOTH:CONSTELLATION:TRACE1:SHOW OFF` hides trace 1 in the display.

[SENSe]:BLUEtooth:DELTa:AVERage:FONE

Sets or returns the average frequency for the low deviation pattern in the Bluetooth measurement.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:DELTa:AVERage:FONE <value>
[SENSe]:BLUEtooth:DELTa:AVERage:FONE?
```

Arguments

`<value> ::= <NR3>`, the average frequency of the low deviation pattern.

Examples

`SENSe:BLUETOOTH:DELTA:AVERAGE:FONE?` might return `139.8309531250E+3` indicating the average frequency of the low deviation pattern is 139.83 kHz.

[SENSe]:BLUEtooth:DELTa:AVERage:FTWO

Sets or returns the average frequency for the high deviation pattern in the Bluetooth measurement.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:DELTa:AVERage:FTWO <value>
[SENSe]:BLUEtooth:DELTa:AVERage:FTWO?
```

Arguments

`<value> ::= <NR3>`, the average frequency of the high deviation pattern.

Examples

`SENSe:BLUETOOTH:DELTA:AVERAGE:FTWO?` might return `139.8309531250E+3` indicating the average frequency of the low deviation pattern is 139.83 kHz.

[SENSe]:BLUEtooth:FDVTime:TRACE:OCTEt? (Query Only)

Returns the selected octet number on the Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FDVTime:TRACE:OCTEt?
```

Arguments

None

Returns

`<NR3>` the octet number.

Examples

`SENSe:BLUEtooth:FDVTime:TRACE:OCTEt?` might return `5` indicating that 5 is the selected octet number.

[SENSe]:BLUEtooth:FDVTime:TRACE:OCTEt:TOTAL:COUNt? (Query Only)

Returns the total octet value to be selected on the Frequency Deviation vs. Time display.

For the standard low-energy range the maximum number of octets available is 36. For standard basic rate range, the maximum number of octets depends on the packet type.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FDVTime:TRACE:OCTEt:TOTAL:COUNt?
```

Arguments

None

Returns

An <NR3> number indicating the maximum numbers of octets available.

Examples

`SENSe:BLUEtooth:FDVTime:TRACE:OCTEt:TOTAL:COUNt?` might return `36` indicating the maximum number of octets selected is 36.

[SENSe]:BLUEtooth:FDVTime:TRACE:VIEW:MODE

Sets or queries view mode in the Frequency Deviation vs. Time display.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FDVTime:TRACE:VIEW:MODE {PACK | OCTET}
[SENSe]:BLUEtooth:FDVTime:TRACE:VIEW:MODE?
```

Arguments

`PACK` indicates the display is in Packet mode.

`OCTET` indicates the display is in Octet mode.

Examples

`SENSe:BLUEtooth:FDVTime:TRACE:VIEW:MODE PACK` sets the view to packet mode.

[SENSe]:BLUEtooth:FILTer:ALPHa

Sets or returns the alpha filter factor (α/BT) in the Bluetooth analysis.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FILTer:ALPHa <value>
[SENSe]:BLUEtooth:FILTer:ALPHa?
```

Arguments

`<value> ::= <NRf>` the filter factor; range: 0.001 to 1.

Examples

`SENSe:BLUETOOTH:FILTER:ALPHA 0.5` sets the filter factor to 0.5.

[SENSe]:BLUEtooth:FILTer:MEASurement

Sets or returns the measurement filter in the Bluetooth measurements.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FILTer:MEASurement {OFF | BR | LE | USER1 | USER2| UOTH }
[SENSe]:BLUEtooth:FILTer:MEASurement?
```

Arguments

`OFF` no measurement filter is used.

`BR`, the Basic Rate filter is used.

`LE`, the Low Energy filter is used.

`USER1`, the User Meas Filter 1 is used.

`USER2`, the User Meas Filter 2 is used.

`UOTH` a user-defined filter is used.

Examples

`SENSe:BLUETOOTH:FILTER:MEASUREMENT USER1` uses the User Measurement Filter 1 as the measurement filter.

[SENSe]:BLUEtooth:FILTer:REFerence

Sets or returns the reference filter used in the Bluetooth measurements.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FILTer:REFerence {OFF | BR | USER1 | USER2| UOTH }
[SENSe]:BLUEtooth:FILTer:REFerence?
```

Related Commands

AADD

Arguments

`OFF` no reference measurement filter is used.

`BR`, the Basic Rate filter is used.

`USER1`, the User Ref Filter 1 is used.

`USER2`, the User Ref Filter 2 is used.

`UOTH`, a user-defined filter is used.

Examples

`SENSe:BLUETOOTH:FILTER:REFERENCE OFF` selects None or no reference filter.

[SENSe]:BLUEtooth:FREQuency:DEViation

Sets or returns the frequency deviation in the Bluetooth analysis.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FREQuency:DEViation <value>
[SENSe]:BLUEtooth:FREQuency:DEViation?
```

Related Commands

[SENSe]:BLUEtooth:FREQuency:DEViation:AUTO (on page 2049)

Arguments

`<value> ::= <NRf>`, the frequency deviation.

The Standard product range is 1 Hz to 40 MHz; the Option 110 product range is 1 Hz to 110 MHz.

Examples

`SENSe:BLUETOOTH:FREQUENCY:DEVIATION 1MHz` sets the frequency deviation to 1 MHz.

[SENSe]:BLUEtooth:FREQuency:DEViation:AUTO

Determines whether to detect the frequency deviation automatically or manually for the Bluetooth measurement.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FREQuency:DEViation:AUTO { 0 | 1 | OFF | ON }
[SENSe]:BLUEtooth:FREQuency:DEViation:AUTO?
```

Related Commands

[SENSe]:BLUEtooth:FREQuency:DEViation (on page 2049)

Arguments

`OFF` or `0` sets the frequency deviation manually.

`ON` or `1` automatically calculates the frequency deviation; (default setting).

Examples

SENSe:BLUETOOTH:FREQUENCY:DEVIATION:AUTO ON automatically calculates the frequency deviation.

[SENSe]:BLUEtooth:FREQuency:ERRor

Sets or returns the frequency error in the Bluetooth analysis parameters (when Auto is off).

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FREQuency:ERRor <value>
[SENSe]:BLUEtooth:FREQuency:ERRor?
```

Related Commands

[SENSe]:BLUEtooth:FREQuency:ERRor:AUTO (on page 2050)

Arguments

<value> ::= <NRf>, the frequency error in Hz.

Examples

SENSe:BLUETOOTH:FREQUENCY:ERROR 0.02 sets the frequency error to 0.02.

[SENSe]:BLUEtooth:FREQuency:ERRor:AUTO

Determines whether the frequency error is set to Auto or Manual.

To enter a manual value, when Auto is Off, use the [SENSe]:BLUEtooth:FREQuency:ERRor command.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:FREQuency:ERRor:AUTO { 0 | 1 | OFF | ON }
[SENSe]:BLUEtooth:FREQuency:ERRor:AUTO?
```

Arguments

OFF or 0 sets the frequency error manually using the [SENSe]:BLUEtooth:FREQuency:ERRor command.

ON or 1 sets the frequency error automatically.

Examples

SENSe:BLUETOOTH:FREQUENCY:ERROR:AUTO ON determines the frequency error automatically.

[SENSe]:BLUEtooth:INBEmissions:POWEr:LIMIt<x>

Sets or queries the limits of the Bluetooth InBand Emission settings.

When <x> = 1, then commands set or query the fTX ± 2 MHz limit.

When <x> = 2, then commands set or query the fTX ± (3 + n) MHz limit.

Conditions

Measurement views: Bluetooth InBand Emissions display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:INBEmissions:POWEr:LIMIt<x> <value>
[SENSe]:BLUEtooth:INBEmissions:POWEr:LIMIt<x>
```

Arguments

<value> ::= <NR3> the limit of the specified inband emissions setting in dBm.

Examples

SENSe:BLUETOOTH:INBEMISSIONS:POWER:LIMIT2? might return -20 indicating the fTX ± 2 limit is -20 dBm.

[SENSe]:BLUEtooth:POWer:CLASs

Sets or queries the power class of the Bluetooth standard.

Conditions

Measurement views: Bluetooth displays

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:POWer:CLASs {THREE|TWO|ONE}
[SENSe]:BLUEtooth:POWer:CLASs?
```

Arguments

THREE is power class 3.

TWO is power class 2.

ONE is power class 1.

Examples

SENSe:BLUETOOTH:POWER:CLASS THREE sets the power class to 3.

[SENSe]:BLUEtooth:STANdard

Sets or queries the Bluetooth standard.

Conditions

Measurement views: Bluetooth Constellation

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:STANdard {BR|LE|EDR}
[SENSe]:BLUEtooth:STANdard?
```

Arguments

`BR` is the Basic Rate standard.

`LE` is the Low Energy standard.

`EDR` is the Eye Diagram standard.

Examples

`SENSe:BLUETOOTH:STANDARD BR` sets the standard type to Basic Rate.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FONE:AVERage:MAX

Sets or returns the maximum limit of the Basic Rate ΔF1 average in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FONE:AVERage:MAX<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FONE:AVERage:MAX?
```

Arguments

`<value> ::= <NRf>` the maximum average limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:DELTA:FONE:AVERAGE:MAX 175.0E+3` sets the maximum Basic Rate limit of the ΔF1 average to 175.0 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FONE:AVERage:MIN

Sets or returns the minimum limit of the Basic Rate ΔF1 average in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FONE:AVERage:MIN<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FONE:AVERage:MIN?
```

Arguments

<value> ::= <NRf> the minimum average limit in Hz.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:DELTA:FONE:AVERAGE:MIN 140.0E+3 sets the minimum limit of the Basic Rate ΔF1 average to 140.0 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FTWO:PERcent

Sets or returns the limit of the Basic Rate ΔF2 percentage in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FTWO:PERcent<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FTWO:PERcent?
```

Arguments

<value> ::= <NRf> the limit in percent (%).

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:DELTA:FTWO:PERCENT? might return 99.00 indicating the limit of the Basic Rate ΔF2 percentage is 99%.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FTWO:RESult

Sets or returns the limit of the Basic Rate ΔF2 result in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FTWO:RESult<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:DELTa:FTWO:RESult?
```

Arguments

<value> ::= <NRf> the limit in Hz.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:DELTA:FTWO:RESULT 115.0E+3 sets the limit of the Basic Rate ΔF2 result to 115.0 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:DRIFt:FNFZero

Sets or returns the limit of the Basic Rate maximum drift fn–f0 in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:DRIFt:FNFZero<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:DRIFt:FNFZero?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:MAX:DRIFT:FNFZERO?` might return 20.00E+3 indicating the limit of the Basic Rate maximum drift fn–f0 is 20 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:FREQuency:OFFSet

Sets or returns the limit of the Basic Rate maximum frequency offset in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:FREQuency:OFFSet <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:FREQuency:OFFSet?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:MAX:FREQUENCY:OFFSET 150.0E+3` sets the Basic Rate maximum frequency offset limit to 150 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:FREQuency:OFFSet:PREAmBDR

Sets or returns the limit of the Basic Rate maximum frequency offset value from the preamble region in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:FREQuency:OFFSet:PREAmBDR <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:MAX:FREQuency:OFFSet:PREAmBDR?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:MAX:FREQUENCY:OFFSET: PREAMBDR 150.0E+3` sets the limit of the Basic Rate maximum frequency offset limit to 150 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:AVERage:MAX

Sets or returns the limit of the Basic Rate Power Class 1 maximum average output power value in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:AVERage:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:AVERage:MAX?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:ONE:AVERAGE:MAX?` might return `20.00` indicating the maximum output power average is 20.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:AVERage:MIN

Sets or returns the limit of the Basic Rate Power Class 1 minimum average output power value in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:AVERage:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:AVERage:MIN?
```

Arguments

<value> ::= <NRf> the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:ONE:AVERAGE:MIN? might return 0.00 indicating the minimum output power average is 0 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:PEAK:MAX

Sets or returns the limit of the Basic Rate Power Class 1 maximum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:PEAK:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:PEAK:MAX?
```

Arguments

<value> ::= <NRf> the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:ONE:PEAK:MAX? might return 23.00 indicating the maximum peak output power is 23.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:PEAK:MIN

Sets or returns the limit of the Basic Rate Power Class 1 minimum peak output power value in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:PEAK:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:ONE:PEAK: MIN?
```

Arguments

<value> ::= <NRf> the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:ONE:PEAK:MIN? might return 3.00 indicating the maximum peak output power is 3.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:AVERage:MAX

Sets or returns the limit of the Basic Rate Power Class 3 maximum average output power value in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:AVERage:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:AVERage:MAX?
```

Arguments

<value> ::= <NRf> the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:THREE:AVERAGE:MAX? might return -40.00 indicating the maximum output power average is -40.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:AVERage:MIN

Sets or returns the limit of the Basic Rate Power Class 3 minimum average output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:AVERage:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:AVERage:MIN?
```

Arguments

<value> ::= <NRf> the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:THREE:AVERAGE:MIN? might return 0.00 indicating the minimum output power average is 0.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:PEAK:MAX

Sets or returns the limit of the Basic Rate Power Class 3 maximum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:PEAK:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:PEAK:MAX?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:THREE:PEAK:MAX?` might return 37.00 indicating the maximum peak output power is 37.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:PEAK:MIN

Sets or returns the limit of the Basic Rate Power Class 3 minimum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:PEAK:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:THREe:PEAK:MIN?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:THREE:PEAK:MIN?` might return 3.00 indicating the maximum peak output power is 3.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:AVERage:MAX

Sets or returns the limit of the Basic Rate Power Class 2 maximum average output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:AVERage:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:AVERage:MAX?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:TWO:AVERAGE:MAX?` might return 4.00 indicating the maximum output power average is 4.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:AVERage:MIN

Sets or returns the limit of the Basic Rate Power Class 2 minimum average output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:AVERage:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:AVERage:MIN?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:TWO:AVERAGE:MIN?` might return -6.00 indicating the minimum output power average is -6.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:PEAK:MAX

Sets or returns the limit of the Basic Rate Power Class 2 maximum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:PEAK:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:PEAK:MAX?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:TWO:PEAK:MAX?` might return 7.00 indicating the maximum peak output power is 7.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:PEAK:MIN

Sets or returns the limit of the Basic Rate Power Class 2 minimum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:PEAK:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BDR:OPOWer:CLASs:TWO:PEAK:MIN?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BDR:OPOWER:CLASS:TWO:PEAK:MIN?` might return -3.00 indicating the maximum peak output power is -3.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FONE:AVERage:MIN

Sets or returns the minimum limit of the Low Energy ΔF1 average in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FONE:AVERage:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FONE:AVERage:MIN?
```

Arguments

<value> ::= <NRf> the minimum average limit in Hz.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:DELTA:FONE:AVERAGE:MIN 225.0E+3 sets the minimum limit of the Low Energy ΔF1 average to 225.0 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FTWO:PERcent

Sets or returns the limit of the Low Energy ΔF2 percentage in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FTWO:PERcent <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FTWO:PERcent?
```

Arguments

<value> ::= <NRf> the limit in percent (%).

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:DELTA:FTWO:PERCENT? might return 99.00 indicating the limit of the Low Energy ΔF2 percentage is 99%.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FTWO:RESult

Sets or returns the limit of the Low Energy ΔF2 result in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FTWO:RESult <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FTWO:RESult?
```

Arguments

<value> ::= <NRf> the limit in Hz.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:DELTA:FTWO:RESULT 185.0E+3 sets the limit of the Low Energy ΔF2 result to 185.0 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:DRIFt:FNFZero

Sets or returns the limit of the Low Energy maximum drift fn–f0 in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:DRIFt:FNFZero <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:DRIFt:FNFZero?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:MAX:DRIFT:FNFZERO?` might return 50.0E+3 indicating the limit of the Low Energy maximum drift fn–f0 is 50 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:FREQuency:OFFSet

Sets or returns the limit of the Low Energy maximum frequency offset in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:FREQuency:OFFSet <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:FREQuency:OFFSet?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:MAX:FREQUENCY:OFFSET 75.0E+3` sets the Basic Rate maximum frequency offset limit to 75 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:FREQuency:OFFSet:PREAmble

Sets or returns the limit of the Low Energy maximum frequency offset value from the preamble region in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:FREQuency:OFFSet:PREAmble <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:MAX:FREQuency:OFFSet:PREAmble?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:MAX:FREQUENCY:OFFSET:PREAMBLE75.0E+3` sets the limit of the Low Enegy maximum frequency offset limit to 75 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:AVERage:MAX

Sets or returns the limit of the Low Energy maximum average output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:AVERage:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:AVERage:MAX?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:OPOWER:AVERAGE:MAX?` might return 10.00 indicating the Low Energy maximum output power average is 10.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:AVERage:MIN

Sets or returns the limit of the Low Energy minimum average output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:AVERage:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:AVERage:MIN?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:OPOWER:AVERAGE:MIN? might return -20.00 indicating the Low Energy minimum output power average is -20 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:PEAK:MAX

Sets or returns the limit of the Low Energy maximum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:PEAK:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:PEAK:MAX?
```

Arguments

<value> ::= <NRf> the limit in dBm.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:OPOWER:PEAK:MAX? might return 13.00 indicating the maximum peak output power is 13.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FONE:AVERage:MAX

Sets or returns the maximum limit of the Low Energy ΔF1 average in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FONE:AVERage:MAX <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:DELTa:FONE:AVERage:MAX?
```

Arguments

<value> ::= <NRf> the maximum average limit in Hz.

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:DELTA:FONE:AVERAGE:MAX 275.0E+3 sets the maximum Low Energy limit of the Low Energy ΔF1 average to 275.0 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:PEAK:MIN

Sets or returns the limit of the Low Energy minimum peak output power value in the Bluetooth Constellation Summary display.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:PEAK:MIN <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:BLE:OPOWer:PEAK:MIN?
```

Arguments

`<value> ::= <NRf>` the limit in dBm.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:BLE:OPOWER:PEAK:MIN?` might return -17.00 indicating the maximum peak output power is -17.00 dBm.

[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:F1FZero

Sets or returns the limit of the maximum fn–fn0 drift in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:F1FZero <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:F1FZero?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:MAX:DRIFT:F1FZERO 20.0E+3` sets the maximum fn–fn0 drift in the packet to 20.00 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:FNFN5

Sets or returns the limit of the maximum fn–fn5 drift in the packet from the Bluetooth summary.

Conditions

Measurement views: Bluetooth summary

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:FNFN5 <value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:FNFN5?
```

Arguments

`<value> ::= <NRf>` the limit in Hz.

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:MAX:DRIFT:FNFN5 20.0E+3` sets the maximum fn–fn5 drift in the packet to 20.00 kHz.

[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:F0FThree

Sets and queries the limit of the LE Coded maximum drift frequency value of F0F3 in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:F0FThree <0 | 1>,<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:F0FThree?
```

Arguments

`<value> ::= <NRf>`

`1` indicates to enable tick mark in “On” column

`0` indicates to disable tick mark in “On” column

Returns

`<NRf>`

Examples

`SENSe:BLUETOOTH:SUMMARY:LIMIT:MAX:DRIFT:LECODED:F0FTHREE 1,85000` sets the limit value to 85 kHz and the tick mark to enabled in the “On” column.

[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:F1FFour

Sets and queries the limit of the LE Coded maximum drift frequency value of F1F4 in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:F1FFour <0 | 1>,<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:F1FFour?
```

Arguments

`<value> ::= <NRf>`

1 indicates to enable tick mark in “On” column

0 indicates to disable tick mark in “On” column

Returns

<NRf>

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:MAX:DRIFT:LECODED:F1FFOUR 1,35000 sets the limit value to 35 kHz and the tick mark to enabled in the “On” column.

[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:FNFN3

Sets and queries the limit of the LE Coded maximum drift frequency value of FNFN3 in the Bluetooth Summary display.

Conditions

Measurement views: Bluetooth summary display

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:FNFN3 <0 | 1>,<value>
[SENSe]:BLUEtooth:SUMMary:LIMIt:MAX:DRIFt:LECoded:FNFN3?
```

Arguments

<value> ::= <NRf>

1 indicates to enable tick mark in “On” column

0 indicates to disable tick mark in “On” column

Returns

<NRf>

Examples

SENSe:BLUETOOTH:SUMMARY:LIMIT:MAX:DRIFT:LECODED:FNFN3 1,15000 sets the limit value to 15 kHz and the tick mark to enabled in the “On” column.

[SENSe]:BLUEtooth:SYMBol:POINts

Sets or returns the number of points per symbol (how many points to use between symbols) in the Bluetooth measurement.

Conditions

Measurement views: Any Bluetooth display.

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:SYMBol:POINts { ONE |TWO | FOUR | EIGHt | SIXTeen | THIRtytwo }
[SENSe]:BLUEtooth:SYMBol:POINts?
```

Arguments

The number of points per symbol.

Examples

`SENSe:BLUETOOTH:SYMBOL:POINTS FOUR` sets the number of points per symbol to four.

[SENSe]:BLUEtooth:TEST:PATTern

Sets or returns the test pattern type in the Bluetooth displays.

Conditions

Measurement views: Any Bluetooth display.

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:TEST:PATTern {LDEViation|HDEViation|TPOTHER}
[SENSe]:BLUEtooth:TEST:PATTern?
```

Related Commands

[SENSe]:BLUEtooth:TEST:PATTern:AUTO:DETEct (on page 2068)

Arguments

`LDEViation` indicates the low deviation test pattern.

`HDEViation` indicates the high deviation test pattern.

`TPOTHER` indicates a user defined test pattern.

Examples

`SENSe:BLUETOOTH:TEST:PATTERN?` might return LDEV indicating the selected test pattern type is the low deviation type.

[SENSe]:BLUEtooth:TEST:PATTern:AUTO:DETEct

Sets or returns the auto detect setting for the Bluetooth displays.

Conditions

Measurement views: Any Bluetooth display.

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:TEST:PATTern:AUTO:DETEct {0|1}
[SENSe]:BLUEtooth:TEST:PATTern:AUTO:DETEct?
```

Related Commands

[SENSe]:BLUEtooth:TEST:PATTern (on page 2068)

Arguments

1 indicates that the auto detect test pattern is enabled (checked in the view).

0 indicates that the auto detect test pattern is not enabled (not checked).

Examples

SENSe:BLUETOOTH:TEST:PATTERN:AUTO:DETECT? might return 0 indicating that the auto detect test pattern is not enabled.

[SENSe]:BLUEtooth:TIME:ZERO:REFERENCE

Sets or returns the Time Zero Reference setting in the Bluetooth display.

Conditions

Measurement views: Any Bluetooth display.

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:TIME:ZERO:REFERENCE {Acquisistion Start|Trigger}
[SENSe]:BLUEtooth:TIME:ZERO:REFERENCE?
```

Arguments

Acquisition Start sets the Time Zero Reference to the start of the acquisition.

Trigger sets the Time Zero Reference to the trigger position.

Examples

SENSe:BLUETOOTH:TIME:ZERO:REFERENCE? might return TRIGGER indicating the Time Zero Reference is the trigger position.

[SENSe]:BLUEtooth:TRACe:TYPE

Sets or queries the type of trace on the Trace tab of the control panel.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:BLUEtooth:TRACe:TYPE {IQ|FREQDEV}
[SENSe]:BLUEtooth:TRACe:TYPE?
```

Arguments

IQ specifies the IQ trace.

FREQDEV specifies the Frequency Deviation trace.

Examples

SENSe:BLUETOOTH:TRACE:TYPE? might return IQ indicating the Trace type is set to IQ.

[SENSe]:CONSte[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Constellation for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (ex: GPDemod Constellation).

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:CONSte[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:CONSte[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

`SENSe:CONSte:MEASview1:SELEcted:SOURce?` queries the Source for Constellation Measurement View 1.

[SENSe]:CCDF:{BANDwidth|BWIDth}

Sets or queries the CCDF measurement bandwidth (frequency span).

Conditions

Measurement views: CCDF

Group

Sense commands

Syntax

```
[SENSe]:CCDF:{BANDwidth|BWIDth} <value>
[SENSe]:CCDF:{BANDwidth|BWIDth}?
```

Arguments

`<value> ::= <NRf>` is the CCDF measurement bandwidth.

Range: 10 Hz to 40 MHz (Standard) / 60 MHz (Option 110).

Examples

`SENSe:CCDF:BANDWIDTH 1MHz` sets the CCDF measurement bandwidth to 1 MHz.

[SENSe]:CCDF:CLEar (No Query Form)

Clears the CCDF accumulator and restarts the measurement.

Conditions

Measurement views: CCDF

Group

Sense commands

Syntax

```
[SENSe]:CCDF:CLEar
```

Arguments

None

Examples

`SENSe:CCDF:CLEAR` clears the CCDF accumulator and restarts the measurement.

[SENSe]:CCDF:TIME:TOTal:LENGth

Sets or queries the CCDF measurement time when `[SENSe]:CCDF:TIME:TYPE` is set to TOTal.

Conditions

Measurement views: CCDF

Group

Sense commands

Syntax

```
[SENSe]:CCDF:TIME:TOTal:LENGth <value>
[SENSe]:CCDF:TIME:TOTal:LENGth?
```

Arguments

`<value>::<NRf>` specifies the CCDF measurement time.

Range: 20 ms to 100 s.

Examples

`SENSe:CCDF:TIME:TOTAL:LENGTH 10` sets the CCDF measurement time to 10 s.

[SENSe]:CCDF:TIME:TYPE

Determines how to repeat the CCDF measurement.

Conditions

Measurement views: CCDF

Group

Sense commands

Syntax

```
[SENSe]:CCDF:TIME:TYPE { SINGLe | TOTal | CONTinuous }
[SENSe]:CCDF:TIME:TYPE?
```

Related Commands

INITiate:CONTinuous (on page 1530)

INITiate[:IMMediate] (on page 1531)

INITiate:RESume (on page 1531)

Arguments

`SINGLe` specifies that the analyzer sets the analysis length to 1 ms and then acquire data once to calculate CCDF.

`TOTal` specifies that the analyzer sets the analysis length to 20 ms and then repeats data acquisition and CCDF calculation for the time specified by the [SENSe]:CCDF:TIME:TOTal:LENGth (on page 2071) command.

`CONTinuous` specifies that the analyzer sets the analysis length to 1 ms and then repeats data acquisition and CCDF calculation continuously. To reset the process, use the [SENSe]:CCDF:CLEar (on page 2070) command or the INITiate commands.

Examples

`SENSe:CCDF:TIME:TYPE SINGLe` specifies that the analyzer sets the analysis length to 1 ms and then acquire data once to calculate CCDF.

[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth

Sets or queries the analysis length in seconds or symbols. The command `[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs` determines which is used. For example, if the symbol rate is 1 MHz and the acquisition length is 20 ms, the range may be 0 to 19999. Setting a specified length changes `[SENSe]:DDEMod[:SOURce<x>]:ANALysis:AUTO` to OFF.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth<value>
[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:ACTual? (on page 2073)

[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs (on page 2098)

[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:AUTO (on page 2073)

Arguments

`<x>` = 1 to 8, representing Range of Source

`<value>::<NRf>` specifies the analysis length in seconds or symbols.

Range in seconds: 200 ns to `[(acquisition length) - 400 ns]`.

If `[(analysis start) + (analysis length)] > [(acquisition length) - 400 ns]`, the actual analysis length is reduced to `[(acquisition length) - 200 ns]`.

Range in symbols: `200 ns * (symbol rate) to [(acquisition length) - 400 ns] *(symbol rate)`.

If `[(analysis start) + (analysis length)] > [(acquisition length) - 400 ns]`, the actual analysis length is reduced to `[(acquisition length) - 200 ns] * (symbol rate)`.

Examples

`SENSe:DDEMOD:SOURce1:ANALYSIS:LENGTH 25.625µs` sets the analysis length of the measurement source1 to 25.625 µs.

`SENSe:DDEMOD:SOURce1:ANALYSIS:LENGTH 256` sets the analysis length of the measurement source1 to 256 symbols.

[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:ACTual? (Query only)

Queries the actual analysis length which returns a value in either seconds or symbols. The command **[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs** determines which is used.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

`[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:ACTual?`

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth (on page 2072)

[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs (on page 2098)

Arguments

`<x>` = 1 to 8, representing Range of Source.

Returns

`<NRf>` Actual analysis length in seconds or symbols.

Examples

`SENSe:DDEMOD:SOURCE1:ANALYSIS:LENGTH:ACTUAL?` might return `25.625E-6`, indicating that the actual analysis length of the measurement source1 is 25.625 µs.

[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:AUTO

Determines whether to set the analysis length of the measurement source automatically or manually.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth:AUTO?
```

Arguments

<x> = 1 to 8, representing Range of Source.

OFF or 0 sets the analysis length manually, using the [SENSe]:DDEMod[:SOURce<x>]:ANALysis:LENGth (on page 2072) command.

ON or 1 sets the analysis length automatically.

Examples

SENSe:DDEMOD:SOURce1:ANALYSIS:LENGTH:AUTO ON sets the analysis length of the measurement source1 automatically.

[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:MODE

Sets or queries the measurement bandwidth mode of the measurement source for Digital Demod measurements.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:MODE { MANual | AUTO | LSPan }
[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:MODE?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval (on page 2074)

Arguments

<x> = 1 to 8, representing Range of Source.

MANual specifies manual bandwidth control mode. A typical use is setting a narrow measurement bandwidth on a small range of frequencies to examine one signal while rejecting the others that are present in a Spectrum graph.

AUTO specifies automatic bandwidth control mode where a measurement picks a bandwidth based on other parameter settings (such as symbol rate, modulation type, filter, and so on).

LSPan (LinkToSpan) specifies Lspan bandwidth control mode, where you can use the Spectrum display to tune the frequency, view the signal, and use the Span control to set the measurement bandwidth. This mode emulates legacy instruments.

Examples

SENSe:DDEMOD:SOURce1:BANDWIDTH:MODE AUTO sets the analyzer bandwidth mode of the measurement source1 to automatically select a measurement bandwidth.

[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval

Sets or queries the measurement bandwidth of the measurement source (frequency span).

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval<value>
[SENSe]:[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:SRATe (on page 2093)

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<value> ::= <NRf>` specifies the measurement bandwidth.

Range: Symbol rate to 40 MHz or with option 110, 110 MHz.

The minimum value depends on the setting of `[:SENSe]:DDEMod[:SOURce<x>]:SRATe`.

Returns

`<NRf>` Actual analysis length in seconds or symbols.

Examples

`SENSe:DDEMOD:SOURce1:BANDWIDTH:TINTERVAL 35.255MHz` sets the measurement bandwidth of the measurement source1 to 35.255 MHz.

[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval:AUTO

Sets or queries the measurement bandwidth of the measurement source (frequency span) automatically.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval:AUTO { OFF | ON| 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval:AUTO?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval (on page 2074)

Arguments

`<x>` = 1 to 8, representing Range of Source.

OFF or 0 sets the measurement bandwidth manually, using the [SENSe]:DDEMod[:SOURce<x>]:{BANDwidth|BWIDth}:TINTerval command.

ON or 1 sets the measurement bandwidth automatically.

Examples

SENSe:DDEMOD:SOURce1:BANDWIDTH:TINTERVAL:AUTO sets the measurement bandwidth of the measurement source1 automatically.

[SENSe]:DDEMod[:SOURce<x>]:BURSt:DETect

Sets or queries burst detection of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:BURSt:DETect { ON | OFF }
[SENSe]:DDEMod[:SOURce<x>]:BURSt:DETect?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:BURSt:THReshold (on page 2076)

Arguments

<x> = 1 to 8, representing Range of Source.

ON analyzes just that burst period if a burst is found. If a burst is not found, does not analyze but displays an error message.

OFF analyzes the whole analysis length.

NOTE: When selecting On and if the signal is not adequate for the demodulation, the measurement will fail and show an error message.

Examples

SENSe:DDEMOD:SOURCE1:BURST:DETECT OFF disables burst detection of the measurement source and analyzes the whole analysis length.

[SENSe]:DDEMod[:SOURce<x>]:BURSt:THReshold

Sets or queries the threshold level of the measurement source above which the input signal is determined to be a burst.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:BURSt:THReshold<value>
[SENSe]:DDEMod[:SOURce<x>]:BURSt:THReshold?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:BURSt:DETect (on page 2076)

Arguments

<x> = 1 to 8, representing Range of Source

<value>::<NRf> specifies the threshold level for detecting bursts.

Range: -100 to -10 dBc.

Examples

SENSe:DDEMOD:SOURce1:BURST:THRESHOLD -25 sets the threshold level of the measurement source1 to -25 dBc.

[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet

Sets or queries the carrier frequency offset for the measurement source in digital modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet<value>
[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet?
```

Related Commands

The settings of the following commands may narrow the effective range.

[SENSe]:DDEMod[:SOURce<x>]:FILTer:ALPHa (on page 2082)

[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence (on page 2083)

[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE (on page 2087)

[SENSe]:DDEMod[:SOURce<x>]:SRATe (on page 2093)

Arguments

<x> = 1 to 8, representing Range of Source.

<value> ::= <NRf> specifies the carrier frequency offset.

Range: -20 MHz to +20 MHz or with Option 110, -55 MHz to +55 MHz.

Examples

SENSe:DDEMOD:SOURCE1:CARRIER:OFFSET 2kHz sets the carrier frequency offset to 2 kHz for the measurement source 1.

[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet:AUTO

Sets or queries whether to detect the carrier frequency automatically for the measurement source in digital modulational analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet:AUTO?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet (on page 2077)

Arguments

<x> = 1 to 8, representing Range of Source

OFF or 0 sets the carrier frequency manually, using the [SENSe]:DDEMod[:SOURce<x>]:CARRier:OFFSet command.

ON or 1 detects the carrier frequency automatically.

Examples

SENSe:DDEMOD:SOURce1:CARRIER:OFFSET:AUTO ON enables automatic detection of the carrier frequency for measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:AVAilable? (Query only)

Determines if the equalizer is available for the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:AVAilable?
```

Arguments

<x> = 1 to 8, representing Range of Source.

Returns

0 indicates the equalizer is not available for the current modulation type and reference filter.

1 indicates the equalizer is available.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:CONVergence

Sets or queries the Convergence value (also known as tap update rate) of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:CONVergence <value>
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:CONVergence?
```

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<value>::<NR3>` specifies the convergence value.

Examples

`SENSe:DDEMOD:SOURce1:EQUALIZER:CONVERGENCE?` might return `1.0000000000E-6` for measurement source 1.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:ENABle

Sets or queries the Equalizer state of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:ENABle {OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:ENABle?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:MODE (on page 2080)

Arguments

`<x>` = 1 to 8, representing Range of Source.

`ON` or `1` enables the Equalizer.

`OFF` or `0` disables the Equalizer.

Examples

`SENSe:DDEMod:SOURCE1:EQU:ENAB 1` might return `1`, indicating that the equalizer is enabled for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:LENGth

Sets or queries the equalizer filter length of measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:LENGth<value>
```

Arguments

<x> = 1 to 8, representing Range of Source.

<value>::<NR1> specifies the equalizer filter length.

Examples

SENSe:DDEMOD:SOURce1:EQUALIZER:LENGTH 39 sets the filter length of measurement source 1 to 39 symbols.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:MODE

Sets or queries the equalizer mode of the measurement source. The equalizer can in learning mode (train) or enabled (hold).

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:MODE {TRAIn | HOLD }
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:MODE?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:ENABle (on page 2079)

Arguments

<x> = 1 to 8, representing Range of Source.

TRAIn places the equalizer in training mode.

HOLD places in the equalizer in enabled mode.

Examples

SENSe:DDEMOD:SOURce1:EQUALIZER:MODE HOLD places the equalizer in enabled mode for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:RESet (No query form)

Resets the equalizer settings of the measurement source to default values.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:RESet
```

Examples

`SENSe:DDEMOD:SOURce1:EQUALIZER:RESET` sets the equalizer parameters of the measurement source1 to their default values.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:TAPS

Sets or queries the number of filter coefficients for the equalizer of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:TAPS <value>
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:TAPS?
```

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<value>::=<NR1>` the filter coefficient for the equalizer.

Examples

`SENSe:DDEMOD:SOURce<x>:EQUALIZER:TAPS 65` sets the measurement source1 filter coefficient to 65.

[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:TSRAtio

Sets or queries the Equalizer taps or Symbol parameter for the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:EQUalizer:TSRAtio { ONE | TWO | FOUR | EIGHt }
```

Arguments

Valid arguments are `ONE`, `TWO`, `FOUR`, or `EIGHt`. Numerals are not valid arguments.

`<x>` = 1 to 8, representing Range of Source.

Examples

`SENSe:DDEMOD:SOURCE1:EQUALIZER:TSRATIO FOUR` sets the Taps or Symbol value to four for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:FILTer:ALPHa

Sets or queries the filter factor (α/BT) for the measurement source in the digital modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:FILTer:ALPHa <value>
[SENSe]:DDEMod[:SOURce<x>]:FILTer:ALPHa?
```

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<value>::<NRf>` specifies the filter factor. Range: 0.001 to 1.

Examples

`SENSe:DDEMOD:SOURCE1:FILTER:ALPHA 0.5` sets the filter factor to 0.5 for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:FILTer:MEASurement

Sets or queries the measurement filter for the measurement source in the digital modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:FILTer:MEASurement { OFF | RRCosine | RCOSine | GAUSsian | RECTangular |
    IS95TXEQ_MEA | IS95TX_MEA | C4FM_P25 | USERx | UOTHer }
[SENSe]:DDEMod[:SOURce<x>]:FILTer:MEASurement?
```

Arguments

The following table lists the arguments.

<x> = 1 to 8, representing Range of Source.

Digital modulation measurement filter

Argument	Measurement filter
OFF	No filter
RRCosine	Root Raised Cosine
RCOSine	Raised Cosine
GAUSsian	Gaussian
RECTangular	Rectangular
IS95TXEQ_MEA	IS95 receive filter for the transmitter configured with both the transmit filter and the phase equalizer.
IS95TX_MEA	IS95 receive filter for the transmitter configured with only the transmit filter.
C4FM_P25	C4FM-P25
USER1	User defined Measurement Filter 1
USER2	User defined Measurement Filter 2
USER3	User defined Measurement Filter 3
UOTHer	Other user defined Measurement Filter

Examples

`SENSe:DDEMOD:SOURCE1:FILTER:MEASUREMENT RRCosine` selects the Root Raised Cosine filter as the measurement filter for the measurement source1.

[SENSe]:DDEMod:SOURCE<x>:FILTer:REFerence

Sets or queries the reference filter for the measurement source in the digital modulation analysis..

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence { OFF | RCOSine | GAUSsian | RECTangular | IS95REF |
   HSINe | SOQPSK_MIL | SOQPSK_ARTM | SBPSK_MIL | USERx | UOTHer }
[SENSe]:DDEMod[:SOURce<x>]:FILTer:REFerence?
```

Arguments

<x> = 1 to 8, representing Range of Source.

The following table lists the arguments.

Digital modulation reference filter

Argument	Measurement filter
OFF	No filter
RCOSine	Raised Cosine
GAUSsian	Gaussian
RECTangular	Rectangular
IS95REF	IS95 reference filter including the response of the transmit filter, the phase equalizer, and the receive (complementary) filter.
HSINe	Half Sine
SOQPSK_MIL	SOQPSK–MIL
SOQPSK_ARTM	SOQPSK–ARTM
SBPSK_MIL	SBPSK–MIL
USER1	User defined Measurement Filter 1
USER2	User defined Measurement Filter 2
USER3	User defined Measurement Filter 3
UOTHer	Other user defined Measurement Filter

Examples

`SENSe:DDEMOD:SOURCE1:FILTER:REFERENCE RCOSine` selects the Raised Cosine filter as the reference filter for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation

Sets or queries the frequency deviation of the measurement source in the digital modulation analysis. Programming a specified frequency deviation sets `[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation:AUTO OFF`.

This command is valid when `[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE` is set to C4FM, FSK2, FSK4, FSK8, or FSK16.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation<value>
[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation?
```

Arguments

<x> = 1 to 8, representing Range of Source.

<value>::<NRf> sets the frequency deviation.

Standard product range: 1 Hz to 40 MHz.

Option 110 product range: 1 Hz to 110 MHz.

Examples

SENSe:DDEMOD:SOURce1:FREQUENCY:DEVIATION 1MHz sets the frequency deviation of the measurement source1 to 1 MHz.

[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation:AUTO

Determines whether to detect automatically or set manually the frequency deviation of the measurement source used to determine the symbol values of an FSK or C4FM signal.

This command is valid when [SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE is set to C4FM, FSK2, FSK4, FSK8, or FSK16.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation:AUTO?
```

Arguments

<x> = 1 to 8, representing Range of Source.

ON or 1 automatically calculates the frequency deviation for the analysis range (default).

OFF or 0 sets the frequency deviation using the [SENSe]:DDEMod[:SOURce<x>]:FREQuency:DEViation command.

Examples

SENSe:DDEMOD:SOURce1:FREQUENCY:DEVIATION:AUTO ON automatically calculates the frequency deviation of the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:MAGNitude:NORMalize

Sets or queries the method for the magnitude normalization of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:MAGNitude:NORMalize { RSYMbol | MSYMbol }
[SENSe]:DDEMod[:SOURce<x>]:MAGNitude:NORMalize?
```

Arguments

<x> = 1 to 8, representing Range of Source

RSYMbol normalizes the magnitude with the RMS symbol magnitude.

MSYMbol normalizes the magnitude with the maximum symbol magnitude.

Examples

SENSe:DDEMOD:SOURCE1:MAGNITUDE:NORMALIZE RSYMbol normalizes the magnitude of measurement source1 with the RMS symbol magnitude.

[SENSe]:DDEMod[:SOURce<x>]:MINDex

Sets or queries the measurement source modulation index of a CPM signal.

This command is valid when [SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE is set to CPM and [SENSe]:DDEMod[:SOURce<x>]:MINDex:AUTO is set to OFF.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:MINDex { 1 | 2 | 3 | 4 | 5 | 6 }
[SENSe]:DDEMod[:SOURce<x>]:MINDex?
```

Arguments

<x> = 1 to 8, representing Range of Source.

The following table shows the arguments and modulation index.

CPM modulation index

Argument	Modulation index
1	4/16, 5/16
2	5/16, 6/16
3	6/16, 7/16
4	7/16, 10/16

Argument	Modulation index
5	12/16, 13/16
6	8/16, 8/16

Examples

`SENSe:DDEMOD:SOURCE1:MINDEX 1` selects the measurement source1 modulation index to `"4/16, 5/16"`.

[SENSe]:DDEMod[:SOURce<x>]:MINDex:AUTO

Determines whether to detect automatically or set manually the measurement source modulation index of a CPM signal. This command is valid when `[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE` is set to CPM.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:MINDex:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:MINDex:AUTO
```

Arguments

`<x>` = 1 to 8, representing Range of Source.

`ON` or `1` automatically calculates the modulation index for the analysis range.

`OFF` or `0` sets the modulation index using the `[SENSe]:DDEMod[:SOURce<x>]:MINDex` command.

Examples

`SENSe:DDEMOD:SOURce1:MINDEX:AUTO ON` automatically calculates the measurement source1 modulation index for the analysis range.

[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE

Sets or queries the modulation type for the measurement source in the digital modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE { QPSK | PSK8 | D8PSK | PIOVER2DBPSK | DQPSK |
   PIOVER4DQPSK | BPSK | OQPSK | QAM16 | QAM32 | QAM64 | QAM128 | QAM256 | QAM1024 | MSK | FSK2 |
   FSK4 | FSK8 | FSK16 | CPM | APSK16| APSK32 | SOQPSK | SBPSK | C4FM }
[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE?
```

Arguments

<x> = 1 to 8, representing Range of Source.

The following table lists the arguments and corresponding modulation type.

Modulation type

Argument	Modulation type
QPSK	QPSK
PSK8	8PSK
D8PSK	D8PSK
PIOVER2DBPSK	π/2 DBPSK
DQPSK	DQPSK
PIOVER4DQPSK	π/4 QPSK
BPSK	BPSK
OQPSK	OQPSK
QAM16	16QAM
QAM32	32QAM
QAM64	64QAM
QAM128	128QAM
QAM256	256QAM
QAM1024	1024QAM
MSK	MSK
FSK2	FSK2
FSK4	FSK4
FSK8	FSK8
FSK16	FSK16
CPM	CPM
APSK16	APSK16
APSK32	APSK32

Argument	Modulation type
SOQPSK	SOQPSK
SBPSK	SBPSK
C4FM	C4FM

Examples

`SENSe:DDEMOD:SOURCE1:MODULATION:TYPE QPSK` selects QPSK modulation system for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:PRESet (No query form)

Presets the modulation analysis analysis of the measurement source to a communication standard.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

`[SENSe]:DDEMod[:SOURce<x>]:PRESet <standard_name>`

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE (on page 2087)

Arguments

<x> = 1 to 8, representing Range of Source.

The following table lists the preset standard names with their modulation types and settings.

Modulation Presets

Preset Name	Modulation type	Settings
“802.15.4”	OQPSK	Symbol rate: 1 MHz
		Meas Filter: None
		Ref Filter: Half sine
		Filter Param: None
		Symbol Pt Location: NA
		Remove Q offset: not checked

Preset Name	Modulation type	Settings
“SBPSK-MIL”	SBPSK	Symbol rate: 2.4 kHz
		Meas Filter: None
		Ref Filter: SBPSK-MIL
		Filter Param: 0.5
		Symbol Pt Location: NA
		Remove Q offset: NA
“SOQPSK-MIL”	SOQPSK	Symbol rate: 2.4 kHz
		Meas Filter: None
		Ref Filter: SOQPSK-MIL
		Filter Param: 0.5
		Symbol Pt Location: Center
		Remove Q offset: checked
“CPM-MIL”	CPM	Symbol rate: 19.2 KHz
		Meas Filter: None
		Ref Filter: None
		Filter Param: None
		Symbol Pt Location: NA
		Remove Q offset: NA
“SOQPSK-ARTM Tier 1”	SOQPSK	Symbol rate: 2.5 MHz
		Meas Filter: None
		Ref Filter: SOQPSK-ARTM
		Filter Param: None
		Symbol Pt Location: Center
		Remove Q offset: checked

Preset Name	Modulation type	Settings
“Project25 Phase I”	C4FM	Symbol rate: 4.8 kHz
		Meas Filter: C4FM-P25
		Ref Filter: Raised cosine
		Filter Param: 0.2
		Symbol Pt Location: NA
		Remove Q offset: NA
“CDMA2000-Base”	QPSK	Symbol rate: 1.2288 MHz
		Meas Filter: IS95 TXEQ_MEA
		Ref Filter: IS95 REF
		Filter Param: None
		Symbol Pt Location: NA
		Remove Q offset: NA
“W-CDMA”	QPSK	Symbol rate: 3.84 MHz
		Meas Filter: Root raised cosine
		Ref Filter: Raised cosine
		Filter Param: 0.22
		Symbol Pt Location: NA
		Remove Q offset: NA

In addition to the specific settings listed in the table, the following general settings are also made when you load any of the defined presets.

Setting	Value
Points/symbol	4
Burst detection mode	Off
Burst detection threshold	-10 dBc
Analysis offset	Auto
Analysis length	Auto

Preset Name	Modulation type	Settings
Frequency offset	Auto	
Measurement BW	Auto	
Frequency deviation	Auto	
Modulation index	Auto	

Examples

`SENSe:DDEMOD:SOURCE1:PRESET "802.15.4"` the measurement source1 demodulation to the standard OQPSK modulation.

[SENSe]:DDEMod[:SOURce<x>]:RING:RADius

Sets or queries the ring radius of the measurement source in the digital APSK modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:RING:RADius <value>
[SENSe]:DDEMod[:SOURce<x>]:RING:RADius?
```

Arguments

`<x>` = 1 to 8, representing Range of Source.

`<value>::<NRf>` specifies the ring radius.

APSK16 valid ring arguments are 1 and 2.

APSK32 valid ring arguments are 1, 2, and 3.

Examples

`SENSe:DDEMOD:SOURce1:RING:RADIUS`

[SENSe]:DDEMod[:SOURce<x>]:RING:ROTation

Sets or queries the ring rotation of the measurement source in the digital APSK modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:RING:ROTation <value>
[SENSe]:DDEMod[:SOURce<x>]:RING:ROTation?
```

Arguments

<x> = 1 to 8, representing Range of Source.

<value>::<NRf> specifies the ring rotation.

APSK16 valid ring arguments are 1 and 2.

APSK32 valid ring arguments are 1, 2, and 3.

Examples

```
SENSe:DDEMOD[:SOURce<x>]:RING:ROTATION
```

[SENSe]:DDEMod[:SOURce<x>]:SRATe

Sets or queries the symbol rate for the measurement source in the digital modulation analysis.

Conditions

Measurement views: General purpose digital modulation

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SRATe<value>
[SENSe]:DDEMod[:SOURce<x>]:SRATe?
```

Arguments

<x> = 1 to 8, representing Range of Source.

<value>::<NRf> specifies the symbol rate.

Standard product range: 100 Hz to 40 MHz.

Option 110 product range: 100 Hz to 110 MHz.

Examples

`SENSe:DDEMOD:SOURCE1:SRATE 21.0E3` sets the symbol rate of measurement source1 to 21 kHz.

[SENSe]:DDEMod[:SOURce<x>]:SWAP:IQ

Determines whether or not to exchange I and Q data of the measurement source before demodulating.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SWAP:IQ { OFF | ON | 0 | 1 }
```

```
[SENSe]:DDEMod[:SOURce<x>]:SWAP:IQ?
```

Arguments

<x> = 1 to 8, representing Range of Source.

`OFF` or `0` uses I and Q data as they are.

`ON` or `1` exchanges I and Q data.

Examples

`SENSe:DDEMOD:SOURce1:SWAP:IQ ON` exchanges I and Q data of the measurement source1 before demodulating.

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:HSSHift

Sets or queries the measurement source Q data half-symbol shift for OQPSK and SOQPSK signals.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:HSSHift { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:HSSHift?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE (on page 2087)

Arguments

`<x>` = 1 to 8, representing Range of Source.

`OFF` or `0` the Q offset shift is not applied.

`ON` or `1` the Q offset shift is applied.

Examples

`SENSe:DDEMod:SOURce1:SYMBol:HSSHift ON` the measurement source Q offset is applied.

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:MAP:SOURce? (Query only)

Queries the user symbol map of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:MAP:SOURce?
```

Arguments

<x> = 1 to 8, representing Range of Source.

Examples

SENSe:DDEMOD:SOURCE1:SYMBOL:MAP:SOURCE? returns the symbol map filename of the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:MAP[:STATe]

Determines whether or not to use the user symbol map of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:MAP[:STATe] { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:MAP[:STATe]?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:MAP:SOURce<x> (on page 2094)

Arguments

<x> = 1 to 8, representing Range of Source.

OFF or 0 disables the user symbol map.

ON or 1 enables the user symbol map.

Examples

SENSe:DDEMOD:SOURCE1:SYMBOL:MAP:STATE ON enables the user symbol map of measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:PLOT:POSition

Sets or queries the symbol point location for measurement source on an SOQPSK waveform.

Conditions

Source keyword is optional, if not present Source1 will be default source.

Effective on SOQPSK waveform and any general purpose digital demodulation views except Signal Quality and Symbol Table.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:PLOT:POSition { EDGe | MIDDle }
```

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:PLOT:POSition?
```

Arguments

<x> = 1 to 8, representing Range of Source.

EDGe sets the symbol location at the edge of the eye opening.

MIDDle sets the symbol location at the middle of the eye opening.

Examples

SENSe:DDEMOD:SOURCE1:SYMBOL:PLOT:POSITION EDGE sets the symbol location the edge of the eye opening for the measurement source 1.

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:POINts

Sets or queries the number of points per symbol of the measurement source (how many points to use between symbols when connecting the dots).

NOTE: 1 is not valid for the GMSK modulation.

NOTE: In the constellation view, select VECTors using the TRACe<x>:CONSte:MODE command first to change Points/Symbol.

Conditions

Measurement views: Constellation, EVM versus Time, Magnitude error versus Time, Phase error versus Time, Freq Dev versus Time, Demod I&Q versus Time.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:POINts { ONE | TWO | FOUR | EIGHt }
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:POINts?
```

Arguments

<x> = 1 to 8, representing Range of Source.

ONE, TWO, FOUR, and EIGHT represent the number of points per symbol.

The following table lists the conditions of use.

Argument	Supported modulation type
ONE	All except SOQPSK, OQPSK, SBPSK
TWO	All except SOQPSK
THREE	All
FOUR	All

Examples

SENSe:DDEMOD:SOURCE1:SYMBOL:POINTS FOUR sets the number of points per symbol of the measurement source1 to four.

[SENSe]:DDEMod[:SOURce<x>]:SYMBol:RATE:SEARch

Determines whether to enable a symbol rate search of the measurement source. This command is valid when the demodulation type is set to FSK2, FSK4, FSK8, or FSK16.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYMBol:RATE:SEARch { OFF | ON | 0 | 1 }
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE (on page 2087)

Arguments

<x> = 1 to 8, representing Range of Source.

OFF or 0 disables the search.

ON or 1 enables the search.

Examples

SENSe:DDEMOD:SOURCE1:SYMBOL:RATE:SEARCH ON enables the symbol rate search of measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD

Determines whether to enable the synchronization word of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD { OFF | ON | 0 | 1 }
[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD?
```

Related Commands

[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD:SYMBol (on page 2098)

Arguments

<x> = 1 to 8, representing Range of Source.

OFF or 0 disables the synchronization word.

ON or 1 enables the synchronization word.

Examples

SENSe:DDEMOD:SOURCE1:SYNCH:WORD ON enables the synchronization word of the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD:SYMBol

Sets or queries the synchronization word of the measurement source when [SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD is ON. The word depends on the modulation type selected by the [SENSe]:DDEMod[:SOURce<x>]:MODulation:TYPE command.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD:SYMBol<block>
[SENSe]:DDEMod[:SOURce<x>]:SYNCh:WORD:SYMBol?
```

Arguments

<x> = 1 to 8, representing Range of Source.

<block>::=#<num_digit><num_byte><sym(1)><sym(2)>...<sym(n)>

Where

<num_digit> is the number of digits in <num_byte>.

<num_byte> is the number of bytes of data that follow.

<sym(n)> is the n^{th} symbol value of the sync word. 32-bit integer.

n: Max 256.

Examples

SENSe:DDEMOD:SOURce1:SYNCH:WORD:SYMBOL #216xxxx (4 symbols) sets a sync word composed of four symbols for the measurement source1.

[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs

Sets or queries the fundamental unit of time of the measurement source.

Conditions

Measurement views: General purpose digital modulation

Source keyword is optional, if not present Source 1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs { SEConds | SYMBols }
[SENSe]:DDEMod[:SOURce<x>]:TIMe:UNITs?
```

Arguments

<x> = 1 to 8, representing Range of Source.

SEConds specifies the fundamental unit of time as seconds.

SYMBols specifies the fundamental unit of time as symbols.

Examples

SENSe:DDEMOD:SOURCE1:TIME:UNITS SEConds specifies the fundamental unit of time as seconds for measurement source 1.

[SENSe]:DIQVtime[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Demod I&Q versus Time for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Demod I&Q versus Time).

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:DIQVtime[:MEASview<y>]:SELEcted:SOURce {"Source 1" "Source 2" "Source 3"| "Source 4"
[SENSe]:DIQVtime[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

SENSe:DIQVtime:MEASview1:SELECTED:SOURce? queries the Source for Demod I&Q versus Time Measurement View .

[SENSe]:DPX:AUDio:DEMod:GAIN

Sets or queries the audio gain.

NOTE: The sound level is also affected by the Windows volume control.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:AUDio:DEMod:GAIN <value>
[SENSe]:DPX:AUDio:DEMod:GAIN?
```

Arguments

`<value>::<NR1>` specifies the audio gain. Range: 0 to 15 (integer).

Examples

`SENSe:DPX:AUDIO:DEMOD:GAIN 7` sets the audio gain to 7.

[SENSe]:DPX:AUDio:DEMod:RXBWidth

Sets or queries the receiver bandwidth in the audio demodulation.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:AUDio:DEMod:RXBWidth <value>
[SENSe]:DPX:AUDio:DEMod:RXBWidth?
```

Arguments

`<value>::<NRf>` specifies the receiver bandwidth in the audio demodulation.

Range: 1 kHz to 500 kHz.

Examples

`SENSe:DPX:AUDIO:DEMOD:RXBWIDTH 30kHz` sets the receiver bandwidth to 30 kHz.

[SENSe]:DPX:AUDio:DEMod:RXFRequency? (Query Only)

Returns the receiver frequency in the audio demodulation. The frequency depends on the setting of the `[SENSe]:DPX:AUDio:DEMod:TUNE` command.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:AUDio:DEMod:RXFRequency?
```

Arguments

None

Returns

`<frequency>::<NRf>` is the receiver frequency in the audio demodulation.

Examples

`SENSe:DPX:AUDIO:DEMOD:RXFREQUENCY?` might return `80.3E+6`, indicating that the receiver frequency is 80.3 MHz.

[SENSe]:DPX:AUDio:DEMod:STATe

Determines whether to enable the audio demodulation.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:AUDio:DEMod:STATe { OFF | ON | 0 | 1 }
[SENSe]:DPX:AUDio:DEMod:STATe?
```

Arguments

`OFF` or `0` disables the audio demodulation.

`ON` or `1` enables the audio demodulation.

Examples

`SENSe:DPX:AUDIO:DEMOD:STATE ON` enables the audio demodulation.

[SENSe]:DPX:AUDio:DEMod:TUNE

Sets or queries how to determine the tuning frequency in the audio demodulation.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:AUDio:DEMod:TUNE { MR | MARK1 | MARK2 | MARK3 | MARK4 | SMARker | FREQcontrol }
[SENSe]:DPX:AUDio:DEMod:TUNE?
```

Arguments

The following table lists the arguments.

Frequency tuning

Argument	Tune with
MR	Reference marker (MR)
MARK1	Marker 1 (M1)
MARK2	Marker 2 (M2)

Argument	Tune with
MARK3	Marker 3 (M3)
MARK4	Marker 4 (M4)
SMARker	Selected marker
FREQcontrol	Center frequency setting

Examples

`SENSe:DPX:AUDIO:DEMOD:TUNE MARK1` sets the tuning frequency to the value at Marker 1.

[SENSe]:DPX:AUDio:DEMod:TYPE

Sets or queries the modulation type in the audio demodulation.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:AUDio:DEMod:TYPE { AM | FM }
[SENSe]:DPX:AUDio:DEMod:TYPE?
```

Arguments

`AM` selects the AM (Amplitude Modulation).

`FM` selects the FM (Frequency Modulation).

Examples

`SENSe:DPX:AUDIO:DEMOD:TYPE FM` selects FM in the audio demodulation.

[SENSe]:DPX:{BANDwidth|BWIDth}:ACTual? (Query Only)

Queries the actual bandwidth whether set automatically or manually.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:{BANDwidth|BWIDth}:ACTual?
```

Arguments

None

Examples

SENSe:DPX:BANDWIDTH:ACTUAL? returns the RBW as a percentage of the Span.

[SENSe]:DPX:{BANDwidth|BWIDth}:RESolution

Sets or queries the resolution bandwidth (RBW) in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:{BANDwidth|BWIDth}:RESolution <value>
[SENSe]:DPX:{BANDwidth|BWIDth}:RESolution?
```

Arguments

<value>::<NRf> specifies the resolution bandwidth.

Range: 1 Hz to 10 MHz.

Examples

SENSe:DPX:BANDWIDTH:RESOLUTION? might return 100.00003E+3 for the RBW.

[SENSe]:DPX:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:{BANDwidth|BWIDth}[:RESolution]:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DPX:{BANDwidth|BWIDth}[:RESolution]:AUTO?
```

Arguments

OFF or 0 specifies that the resolution bandwidth is set manually using the [SENSe]:DPX:{BANDwidth|BWIDth}:ACTual? command.

ON or 1 specifies that the resolution bandwidth is set automatically.

Examples

SENSe:DPX:BANDWIDTH:AUTO ON sets the resolution bandwidth automatically.

[SENSe]:DPX:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:CLEar:RESults
```

Arguments

None

Examples

`SENSe:DPX:CLEAR:RESULTS` restarts multi-trace functions.

[SENSe]:DPX:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature |
   SPECtral}
[SENSe]:DPX:COLor?
```

Arguments

The following table lists the arguments.

Color palette for DPX, Spectrum

Argument	Palette
RED	Red
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray

Argument	Palette
TEMPerature	Temperature
SPECtral	Spectral

Examples

`SENSe:DPX:COLOR TEMPERATURE` selects the temperature color palette.

[SENSe]:DPX:COLor:MAXimum

Sets or queries the maximum value of the color axis in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:COLor:MAXimum <value>
[SENSe]:DPX:COLor:MAXimum?
```

Arguments

`<value> ::= <NRf>` specifies the maximum value of the color axis.

Range: The minimum value to 100%.

The minimum value is set using the `[SENSe]:DPX:COLor:MINimum` command.

Examples

`SENSe:DPX:COLOR:MAXIMUM 90` sets the maximum value of the color axis to 90%.

[SENSe]:DPX:COLor:MINimum

Sets or queries the minimum value of the color axis in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:COLor:MINimum <value>
[SENSe]:DPX:COLor:MINimum?
```

Arguments

`<value>::<NRf>` specifies the minimum value of the color axis.

Range: 0% to the maximum value.

The maximum value is set using the `[SENSe]:DPX:COLor:MAXimum` command.

Examples

`SENSe:DPX:COLOR:MINIMUM 10` sets the minimum value of the color axis to 10%.

[SENSe]:DPX:COLor:REVerse[:STATe]

Determines whether to reverse the color palette in the DPX, Spectrum view. When reversed, the highest density takes the color normally used for the lowest.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

`[SENSe]:DPX:COLor:REVerse[:STATe] {OFF | ON | 0 | 1}`

`[SENSe]:DPX:COLor:REVerse[:STATe]?`

Arguments

`OFF` or `0` uses the color palette in its normal order.

`ON` or `1` reverses the color palette.

Examples

`SENSE:DPX:COLOR:REVERSE:STATE ON` reverses the color palette.

[SENSe]:DPX:DDENsity:MEASurement:SHOW

Sets the Show measurement value (measurement always visible for DPX Trigger) or queries for the current value.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DDENsity:MEASurement:SHOW { OFF | ON | 0 | 1 }
[SENSe]:DPX:DDENsity:MEASurement:SHOW?
```

Arguments

`OFF` or `0` specifies that the Show measurement value is disabled.

`ON` or `1` specifies that the Show measurement value is disabled.

Examples

`SENSe:DPX:DDENSITY:MEASUREMENT:SHOW ON` enables the Show measurement value.

SENSe:DPX:DGRam:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:COLor { RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature
    | SPECtral }
[SENSe]:DPX:COLor?
```

Arguments

The following table lists the arguments.

Argument	Palette
RED	Red
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray
TEMPerature	Temperature
SPECtral	Spectral

Examples

`SENSe:DPX:DGRam:COLOR TEMPerature` selects the temperature color palette.

[SENSe]:DPX:DGRam:COLor:MAXimum

Sets or queries the maximum value of the color axis in the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:COLor:MAXimum <value>
[SENSe]:DPX:DGRam:COLor:MAXimum?
```

Arguments

`<value> ::= <NRf>` specifies the maximum value of the color axis.

Range: –50 dBm to –169.00 dBm.

The minimum value is set using the `[SENSe]:DPX:DGRam:COLor:MINimum` command.

Examples

`SENSe:DPX:DGRAM:COLOR:MAXIMUM 0` sets the maximum value of the color axis to 0.00 dBm.

[SENSe]:DPX:DGRam:COLor:MINimum

Sets or queries the minimum value of the color axis in the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:COLor:MINimum <value>
[SENSe]:DPX:DGRam:COLor:MINimum?
```

Arguments

`<value> ::= <NRf>` specifies the maximum value of the color axis.

Range: 49.00 dBm to –170.00 dBm.

The maximum value is set using the `[SENSe]:DPX:DGRam:COLor:MAXimum` command.

Examples

`SENSe:DPX:DGRAM:COLOR:MINIMUM -100` sets the minimum value of the color axis to –100.00 dBm.

[SENSe]:DPX:DGRam:COLor:REVerse

Sets or queries reverse color scheme state.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:COLor:REVerse {OFF | ON | 0 | 1}
[SENSe]:DPX:DGRam:COLor:REVerse?
```

Related Commands

SENSe:DPX:DGRam:COLor (on page 2106)

Arguments

`OFF` or `0` disables Reverse color scheme.

`ON` or `1` enables Reverse color scheme

Returns

`0` disables Reverse color scheme.

`1` enables Reverse color scheme.

Examples

`SENSe:DPX:DGRam:COLor:REVerse OFF` disables reverse color scheme.

[SENSe]:DPX:DGRam:POINts:COUNt

Sets or queries the number of trace points acquired for the DPXogram display.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:POINts:COUNt { P801 | P2401 | P4001 }
[SENSe]:DPX:DGRam:POINts:COUNt?
```

Arguments

`P801` sets the number of sample points to 801.

`P2401` sets the number of sample points to 2401.

`P4001` sets the number of sample points to 4001.

Examples

`SENSe:DPX:DGRAM:POINTS:COUNT P2401` sets the number of trace points to acquire for the DPXogram display.

[SENSe]:DPX:DGRam:TIME:CAPacity? (Query Only)

Returns the time capacity of the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:TIME:CAPacity?
```

Arguments

None

Returns

<Time> ::= <String> The time capacity in hours:minutes:seconds.

Examples

SENSe:DPX:DGRAM:TIME:CAPACITY? might return "0:25:50" indicating that the time capacity of the measurement was 0 hours, 25 minutes, and 50 seconds.

[SENSe]:DPX:DGRam:TIME:RESolution

Sets or queries the time resolution of the DPXogram measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:TIME:RESolution <value>
[SENSe]:DPX:DGRam:TIME:RESolution?
```

Arguments

<value> ::= <NRf> specifies the time resolution of the DPXogram measurement.

Examples

SENSe:DPX:DGRAM:TIME:RESOLUTION 25.0 ms sets the time resolution to 25 ms.

[SENSe]:DPX:DGRam:TIME:RESolution:AUTO

Determines whether to set the time resolution automatically or manually in the DPXogram measurement.

When Auto is enabled, the time resolution value is based on the Time/div setting. See the DISPlay:DPX:DGRam:TIME[:SCALe]:PDIVision command.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:TIME:RESolution:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DPX:DGRam:TIME:RESolution:AUTO?
```

Arguments

OFF or 0 disables the auto time resolution.

ON or 1 enables the auto time resolution.

Examples

SENSe:DPX:DGRAM:TIME:RESOLUTION:AUTO ON sets the timer resolution automatically.

[SENSe]:DPX:DGRam:WATerfall:DIRection

Sets or queries the direction of the Waterfall (DPXogram) display.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:WATerfall:DIRection { NW | NE }
[SENSe]:DPX:DGRam:WATerfall:DIRection?
```

Arguments

`NW` sets the display direction to northwest.

`NE` sets the display direction to northeast.

Examples

`SENSe:DPX:DGRAM:WATERFALL:DIRECTION NW` sets the waterfall display direction to northwest.

[SENSe]:DPX:DGRam:WATerfall:ENABle

Sets or queries the Waterfall (DPXogram) display.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:WATerfall:ENABle { OFF | ON | 0 | 1 }
[SENSe]:DPX:DGRam:WATerfall:ENABle?
```

Arguments

`OFF` or `0` disables the Waterfall display.

`ON` or `1` enables the Waterfall display.

Examples

`SENSe:DPX:DGRAM:WATERFALL:ENABLE ON` enables the 3-D Waterfall display.

[SENSe]:DPX:DGRam:Y[:SCALe]:AUTO (No Query Form)

Rescales the height axis automatically to fit the waveform to the screen in the DPXogram display.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:Y[:SCALe]:AUTO
```

Arguments

None

Examples

`SENSe:DPX:DGRAM:Y[:SCALE]:AUTO` rescales the height scale automatically to fit the waveform to the DPXogram display.

[SENSe]:DPX:DGRam:Y[:SCALe]:RESet (No Query Form)

Resets the height scale of the DPXogram display to the default values:

Height position = 0 dB and Height scale = 100 dB.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DGRam:Y[:SCALe]:RESet
```

Arguments

None

Examples

`SENSe:DPX:DGRAM:Y[:SCALE]:RESET` resets the height scale of the DPXogram display.

[SENSe]:DPX:DWELl

Sets or queries the value of the Dwell time for the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DWELl <value>
[SENSe]:DPX:DWELl?
```

Arguments

`<value>::<NRf>` specifies the time the DPX sweep remains in a frequency segment collecting data and updating the bitmap and traces before moving on to the next higher frequency segment.

Range: 50 ms to 100 s per frequency segment.

Examples

`SENSe:DPX:DWELl 100ms` sets the dwell value for sweeps to 100 ms.

[SENSe]:DPX:DWELI:AUTO

Sets the value of the Dwell time automatically or queries for the current value.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:DWELl:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DPX:DWELl:AUTO?
```

Related Commands

[SENSe]:DPX:DWELI (on page 2112)

Arguments

`OFF` or `0` specifies that the dwell is set manually.

`ON` or `1` specifies that the dwell is set automatically.

Examples

`SENSe:DPX:DWELl:AUTO ON` sets the dwell value automatically for sweeps.

[SENSe]:DPX:FREQuency:CENTer

Sets or queries the center frequency in the DPX, Spectrum measurement.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:CENTer <value>
[SENSe]:DPX:FREQuency:CENTer?
```

Related Commands

[SENSe]:DPX:FREQuency:STARt (on page 2115)

[SENSe]:DPX:FREQuency:STOP (on page 2116)

Arguments

`<value> ::= <NRf>` specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:DPX:FREQUENCY:CENTER 7.5GHz` sets the center frequency to 7.5 GHz.

[SENSe]:DPX:FREQuency:SPAN

Sets or queries the frequency span in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:SPAN <value>
[SENSe]:DPX:FREQuency:SPAN?
```

Arguments

`<value> ::= <NRf>` is the frequency span.

Range: 10 Hz to 40 MHz (Standard) / 110 MHz (Option 110)

Examples

`SENSe:DPX:FREQUENCY:SPAN 20MHz` sets the span to 20 MHz.

[SENSe]:DPX:FREQuency:SPAN:{BANDwidth|BWIDth} [:RESolution]:RATio

Determines whether to set the resolution bandwidth (RBW) automatically or manually in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:SPAN:{BANDwidth|BWIDth}[:RESolution]:RATio <value>
[SENSe]:DPX:FREQuency:SPAN:{BANDwidth|BWIDth}[:RESolution]:RATio?
```

Related Commands

[SENSe]:DPX:{BANDwidth|BWIDth}[:RESolution]:AUTO (on page 2103)

Arguments

`<value> ::= <NRf>` is used to calculate the RBW.

Examples

`SENSe:DPX:FREQuency:SPAN:BANDWIDTH:RATIO 100` the ratio of 100 is used to set the resolution bandwidth when `SENSe:DPX:{BANDwidth|BWIDth}[:RESolution]:AUTO` is set to ON.

[SENSe]:DPX:FREQuency:STARt

Sets or queries the measurement start frequency (left edge on the graph) in the DPX, Spectrum measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the `[SENSe]:DPX:FREQuency:CENTer` command.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:STARt <value>
[SENSe]:DPX:FREQuency:STARt?
```

Related Commands

[SENSe]:DPX:FREQuency:STOP (on page 2116)

Arguments

`<value> ::= <NRf>` is the measurement start frequency.

Range: (center frequency) ± (span)/2.

Examples

`SENSe:DPX:FREQUENCY:START 6.95GHz` sets the start frequency to 6.95 GHz.

[SENSe]:DPX:FREQuency:STEP

Sets or queries the frequency step size (the amount per press by which the up or down key changes the setting value). Programming a specified step size sets `[SENSe]:DPX:FREQuency:STEP:AUTO OFF`.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:STEP <value>
[SENSe]:DPX:FREQuency:STEP?
```

Related Commands

[SENSe]:DPX:FREQuency:STEP:AUTO (on page 2116)

Arguments

`<value> ::= <NRf>` specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSE:DPX:FREQUENCY:STEP 1.5kHz` sets the step size to 1.5 kHz.

[SENSe]:DPX:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:DPX:FREQuency:STEP:AUTO?
```

Arguments

`OFF` or `0` specifies that the frequency step size is set manually using the `[SENSe]:DPX:FREQuency:STEP` command.

`ON` or `1` specifies that the frequency step size is set automatically.

Examples

`SENSE:DPX:BANDWIDTH:AUTO ON` sets the frequency step size automatically.

[SENSe]:DPX:FREQuency:STOP

Sets or queries the measurement stop frequency (right edge of the graph) in the DPX, Spectrum measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the `[SENSe]:DPX:FREQuency:CENTer` command.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:FREQuency:STOP <value>
[SENSe]:DPX:FREQuency:STOP?
```

Related Commands

[SENSe]:DPX:FREQuency:STARt (on page 2115)

Arguments

`<value>::<NRf>` is the measurement stop frequency.

Range: (center frequency) ± (span)/2.

Examples

`SENSe:DPX:FREQUENCY:STOP 7.05GHz` sets the stop frequency to 7.05 GHz.

[SENSe]:DPX:PLOT

Sets or queries the plot in the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:PLOT { DGRam | SPLit | SPECtrum | ZSPan | FREQuency | PHASe }
[SENSe]:DPX:PLOT?
```

Arguments

`DGRam` selects the DPXogram display.

`SPLit` selects the DPX Split display.

`SPECtrum` selects the DPX, Spectrum display.

`ZSPan` select the DPX Zero Span display.

`FREQuency` selects the DPX Frequency vs Time display.

`PHASe` selects the DPX Phase vs Time display.

Examples

`SENSe:DPX:PLOT SPECTRUM` selects the DPX, Spectrum display

[SENSe]:DPX:POINts:COUNt

Sets the number of trace points acquired for the DPX, Spectrum display.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:POINts:COUNt { P801 | P2401 | P4001 | P10401 }
[SENSe]:DPX:POINts:COUNt?
```

Arguments

`P801` sets the number of sample points to 801.

`P2401` sets the number of sample points to 2401.

`P4001` sets the number of sample points to 4001.

`P8001` sets the number of sample points to 8001.

`P10401` sets the number of sample points to 10401.

Examples

`SENSe:DPX:POINTS:COUNT P2401` sets the number of trace points to acquire for the DPX, Spectrum display.

[SENSe]:DPX:TDM:{BANDwidth|BWIDth}

Sets or queries the value of the measurement bandwidth in the DPX measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:{BANDwidth|BWIDth} <value>
[SENSe]:DPX:TDM:{BANDwidth|BWIDth}?
```

Arguments

`<value>::<NRf>` specifies the measurement bandwidth.

Range: 100 Hz to Max AcqBW.

Examples

`SENSe:DPX:TDM:BANDWIDTH 200` sets the measurement bandwidth to 200 Hz.

[SENSe]:DPX:TDM:{BANDwidth|BWIDth}:ACTual? (Query Only)

Queries the actual bandwidth in the DPX measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:{BANDwidth|BWIDth}:ACTual?
```

Arguments

None

Returns

`<NRf>` The actual RBW in Hz.

Examples

`SENSe:DPX:TDM:BANDWIDTH:ACTUAL?` might return `10E+3`, indicating that the actual bandwidth is 10 kHz

[SENSe]:DPX:TDM:FREQuency:CENTer

Sets or queries the center frequency in the DPX, Spectrum measurement.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:CENTer <value>
[SENSe]:DPX:TDM:FREQuency:CENTer?
```

Arguments

`<value>::<NRf>` specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:DPX:TDM:FREQUENCY:CENTER 7.5GHz` sets the center frequency to 7.5 GHz.

[SENSe]:DPX:TDM:FREQuency:TXBer:CLEar:RESults (No Query Form)

Clears the measurement results of the active Tx BER measurement. Sending this command does not halt the Tx BER measurement.

Conditions

Measurement views: DPX, frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:CLEar:RESults
```

Arguments

None

Examples

`SENSe:DPX:TDM:FREQUENCY:TXBER:CLEAR:RESULTS` clears the results of the active TxBER measurement, but does not halt the measurement.

[SENSe]:DPX:TDM:FREQuency:TXBer:ENABle

Sets or queries the Tx BER measurement.

Conditions

Measurement views: DPX, frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:ENABle { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or `0` halts the Tx BER measurement.

`ON` or `1` starts the Tx BER measurement.

Returns

Examples

```
SENSe:DPX:TDM:FREQUENCY:TXBER:ENABLE
```

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern

Sets or queries the Tx BER data pattern.

Conditions

Measurement views: DPX frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern { PRBS9 | PRBS11 | PRBS15 | USER }
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern?
```

Arguments

`PRBS9` specifies a 9-bit PRBS as the data pattern.

`PRBS11` specifies a 11-bit PRBS as the data pattern.

`PRBS15` specifies a 15-bit PRBS as the data pattern

`USER` specifies a user-defined sequence as the data pattern.

Returns

`<string>` which is the selected data pattern. Returned strings are the same as the arguments.

Examples

`SENSe:DPX:TDM:FREQUENCY:TXBER:PATTERN PRBS9` sets the data pattern to PRBS9.

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:INVert

Sets or queries the data pattern Invert setting.

Conditions

Measurement views: DPX frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:INVert { 0 | 1 | OFF | ON }
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:INVert?
```

Arguments

`OFF` or `0` sets the data pattern to normal.

`ON` or `1` inverts the data pattern.

Returns

`<value> ::= <NR1>` where:

`0` indicates the data pattern is normal.

`1` indicates the data pattern is inverted.

Examples

`SENSe:DPX:TDM:FREQUENCY:TXBER:PATTERN:INVERT 1` inverts the data pattern.

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REPeat

Sets or queries the test duration for a User Pattern. A User Pattern test duration can be one time through or it can repeat.

Conditions

Measurement views: DPX frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REPeat { 0 | 1 | OFF | ON }
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REPeat?
```

Arguments

`OFF` or `0` sets the data pattern to normal.

`ON` or `1` inverts the data pattern.

Returns

<value> ::= <NR1> where:

0 indicates repeat is off.

1 indicates repeat is on.

Examples

SENSe:DPX:TDM:FREQUENCY:TXBER:PATTERN:REPEAT 1 causes the User pattern to repeat.

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REVerse

Sets or queries whether the data pattern is in normal order or reversed. This setting applies only to PRBS patterns.

Conditions

Measurement views: DPX frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REVerse { 0 | 1 | OFF | ON }
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:REVerse?
```

Arguments

OFF or 0 sets the data pattern to normal order.

ON or 1 sets the data pattern to reversed order.

Returns

<value> ::= <NR1> where:

0 indicates the data pattern is in normal order.

1 indicates the data pattern is in reversed order.

Examples

SENSe:DPX:TDM:FREQUENCY:TXBER:PATTERN:REVERSE? might return 1, indicating the data pattern is reversed.

[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:SOURce? (Query Only)

Returns the path and file name of the user-defined pattern file.

Conditions

Measurement views: DPX frequency

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:FREQuency:TXBer:PATTern:SOURce?
```

Returns

<path>::<string> which is the path to the defined User data pattern.

Examples

SENSe:DPX:TDM:FREQUENCY:TXBER:PATTERN:SOURCE? might return "C:\RSA5100B Files\Example Files\SampleUserPattern.csv".

[SENSe]:DPX:TDM:RBW

Sets or queries the value of the RBW filter.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:RBW <value>
[SENSe]:DPX:TDM:RBW?
```

Arguments

<value>::<NRf> specifies the RBW filter value.

Range: 1 Hz to 60MHz

Examples

SENSe:DPX:TDM:RBW 2.5 sets the RBW filter value to 2.5 Hz.

[SENSe]:DPX:TDM:RBW:STATe

Determines whether to set the resolution bandwidth (RBW) filter automatically or manually in the DPX measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:RBW:STATe { OFF | ON | 0 | 1 }
[SENSe]:DPX:TDM:RBW:STATe?
```

Arguments

OFF or 0 specifies that the RBW is set automatically.

ON or 1 specifies that the RBW is set manually.

Examples

SENSe:DPX:TDM:RBW:STATE ON sets the RBW manually.

[SENSe]:DPX:TDM:SWEep:TIME

Sets or queries the sweep time when the plot is set to ZSPan, FREQuency, or PHASe.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:SWEep:TIME <value>
[SENSe]:DPX:TDM:SWEep:TIME?
```

Arguments

`<value>::<NRf>` specifies the sweep time.

Range: 100 ηs to 2000 s.

Examples

`SENSe:DPX:TDM:SWEEP:TIME 200` sets the sweep time to 200 s.

[SENSe]:DPX:TDM:TMOTion

Sets or queries the trace motion when the plot is set to ZSPan, FREQuency, or PHASe.

Conditions

Measurement views: DPX, Spectrum

Group

Sense commands

Syntax

```
[SENSe]:DPX:TDM:TMOTion { NONE | ROLL | NORMal }
[SENSe]:DPX:TDM:TMOTion?
```

Arguments

`NONE` turns scrolling off.

`ROLL` shifts the previous data points to the left and the latest data point to the right edge of the display.

`NORMAL` shifts the latest data point on the display from left to right.

Examples

`SENSe:DPX:TDM:TMOTION NORMAL` sets the scroll direction to normal.

[SENSe]:EDIagram[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Eye diagram for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Eye diagram).

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:EDIagram[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:EDIagram[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

`SENSe:EDIagram:MEASview1:SELEcted:SOURce?` queries the Source for Eye diagram Measurement View 1.

[SENSe]:DEMOd:EVM[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of EVM versus Time for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Eye diagram).

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:DEMOd:EVM[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:DEMOd:EVM[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

`SENSe:DEMOd:EVM:MEASview1:SELEcted:SOURce?` queries the Source for EVM versus Time Measurement View 1.

SENSe:EMC:ACCEssory<x>:ANTEnna:DISTance

Sets or queries the distance between EUT and Antenna in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:ANTEnna:DISTance <value>
SENSe:EMC:ACCEssory<x>:ANTEnna:DISTance?
```

Arguments

`<value> = <NR3>`

Returns

<NR3>

Examples

`SENSe:EMC:ACCEssory1:ANTEnna:DISTance` might returns `10.5`, indicating that the distance between accessory 1 (Antenna) and EUT is 10.5 m.

SENSe:EMC:ACCEssory<x>:ASSEt:TAG

Sets or queries the asset tag of the specified accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:ASSEt:TAG <arg>
SENSe:EMC:ACCEssory<x>:ASSEt:TAG?
```

Arguments

`<arg> = "String"`

Returns

<String>

Examples

`SENSe:EMC:ACCEssory1:ASSEt:TAG` might return `A4001993`, indicating that asset tag of accessory 1 is A4001993.

SENSe:EMC:ACCEssory<x>:CALibration:DATE

Sets or queries the Calibration date of the specified accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:CALibration:DATE <arg>
SENSe:EMC:ACCEssory<x>:CALibration:DATE?
```

Arguments

`<arg> = "String"`

Returns

<String>

Examples

`SENSe:EMC:ACCEssory1:CALibration:DATE` might return `"9/21/2017"`, indicating that calibration date of the accessory 1 is 9/21/2017 (21st of September 2017).

SENSe:EMC:ACCEssory<x>:CALibration:DATE:DISAble

Sets or queries the enabling and disabling the calibration due date of the specified accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:CALibration:DATE:DISAble { 0 | OFF | 1 | ON}
SENSe:EMC:ACCEssory<x>:CALibration:DATE:DISAble?
```

Arguments

`0` or `OFF` disables the calibration due date check box

`1` or `ON` enables the calibration due date check box

Returns

<Boolean>0,1

Examples

`SENSe:EMC:ACCEssory1:CALibration:DATE:DISAble 0` will disable the calibration due date check box of accessory 1.

SENSe:EMC:ACCEssory<x>:CONStant:LOSS

Sets or queries the Constant loss of an accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:CONStant:LOSS <value>
SENSe:EMC:ACCEssory<x>:CONStant:LOSS?
```

Arguments

`<value> = <NR3>`

Returns

<NR3>

Examples

`SENSe:EMC:ACCEssory1:CONStant:LOSS` might return `10.00`, indicating that the Constant Loss of accessory 1 is 10 dB.

SENSe:EMC:ACCEssory<x>:ENABle

Sets or queries enabling and disabling the specified accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:ACCEssory<x>:ENABle?
```

Arguments

`0` or `OFF` disables the accessory

`1` or `ON` enables the accessory

Returns

<Boolean>0,1

Examples

`SENSe:EMC:ACCEssory<x>:ENABle 0` will disable accessory 1.

SENSe:EMC:ACCEssory<x>:FREQuency:INTerpolation

Sets or queries the frequency interpolation of an accessory in EMC View.

`<x> = <NR1> 1 to 6`

Conditions

Measurement views: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:FREQuency:INTerpolation { LIN | LOG}
SENSe:EMC:ACCEssory<x>:FREQuency:INTerpolation?
```

Arguments

`LIN` = Sets Linear as frequency interpolation

`LOG` = Sets Log as frequency interpolation

Returns

<String> LIN or LOG

Examples

`SENSe:EMC:ACCEssory1:ANTEnna:DISTance` might returns `10.5`, indicating that the distance between accessory 1 (Antenna) and EUT is 10.5 m.

SENSe:EMC:ACCEssory<x>:LOSS:TABLe:ADD (No Query Form)

Adds a row in the loss table with values for the specified accessory in EMC view.

<x> = <NR1> 1 to 6

NOTE: This command works only when the specified accessory is enabled.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:LOSS:TABLe:ADD <arg1,arg2>
```

Arguments

`<arg1>` = Specifies the frequency value

`<arg2>` = Specifies the Gain/Loss value

Returns

None

Examples

`SENSe:EMC:ACCEssory1:LOSS:TABLe:ADD 30KHz ,10` adds a new row to the accessory 1 loss table with frequency 30 kHz and an RBW of 10 k.

SENSe:EMC:ACCEssory<x>:LOSS:TABLe:DELete:ALL (No Query Form)

Deletes all the row in the loss table for the specified accessory in EMC view.

<x> = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:LOSS:TABLe:DELete:ALL
```

Arguments

None

Returns

None

Examples

`SENSe:EMC:ACCEssory2:LOSS:TABLe:DELete:ALL` deletes all the rows in the loss table of accessory 2.

SENSe:EMC:ACCEssory<x>:LOSS:TYPE

Sets or queries the loss type of an accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:LOSS:TYPE {ALT | CLOS | AFT}
SENSe:EMC:ACCEssory<x>:LOSS:TYPE?
```

Arguments

`ALT` = Antenna Loss Table

`CLOS` = Constant Loss

`AFT` = Antenna Factor

Returns

`<String>` ALT or CLOS or AFT

Examples

`SENSe:EMC:ACCEssory1:LOSS:TYPE?` might return `CLOS`, indicating that the loss type of accessory 1 is CLOS (Constant Loss).

SENSe:EMC:ACCEssory<x>:MODel

Sets or queries the model number of the specified accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:MODel <arg>
SENSe:EMC:ACCEssory<x>:MODel?
```

Arguments

`<arg> = "String"`

Returns

<String>

Examples

`SENSe:EMC:ACCEssory2:MODel?` might return `A16235`, indicating that the model number of accessory 2 is A16235.

SENSe:EMC:ACCEssory<x>:SERial

Sets or queries the serial number of the specified accessory in EMC View.

<x> = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:SERial <arg>
SENSe:EMC:ACCEssory<x>:SERial?
```

Arguments

`<arg> = "String"`

Returns

<String>

Examples

SENSe:EMC:ACCEssory1:SERial might return S1987652, indicating that the serial number of accessory 1 is S1987652.

SENSe:EMC:ACCEssory<x>:TYPE

Sets or queries the type of specified accessory in EMC view.

<x> = <NR1> 1 to 6

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:ACCEssory<x>:TYPE <arg>
SENSe:EMC:ACCEssory<x>:TYPE?
```

Arguments

If emission type is Conducted:

If emission type is Radiated:

<arg> = {ANTE | NFPR | CABL | AMPL | LIMI | ATTE | FILT | OTHE }

where

LISN = LISN

CABL = Cable

LIMI = Limiter

AMPL = Amplifier

ATTE = Attenuator

FILT = Filter

OTHE = Others

ANTE = Antenna

NFPR = Near Field Probe

Returns

<String> See Arguments

Examples

SENSe:EMC:ACCEssory1:TYPE might return LIMI, indicating that accessory 1 is Limiter.

SENSe:EMC:CLEar:RESults (No Query Form)

Clears all the data in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:CLEar:RESults
```

Arguments

None

Returns

None

Examples

`SENSE:EMC:CLEAR:RESULTS` clears the data in the EMC-EMI display.

SENSe:EMC:EMISsion:TYPE

Sets or queries the type of emission in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:EMISsion:TYPE {COND | RADI}
SENSe:EMC:EMISsion:TYPE?
```

Arguments

`COND` = Sets Conducted as Emission type

`RADI` = Sets Radiated as Emission type

Returns

<String> COND or RADI

Examples

`SENSE:EMC:EMISSION:TYPE` sets Conducted as the emission type.

SENSe:EMC[:FREQuency]:OVERlap? (Query Only)

Queries whether there is a frequency range overlap in ranges and Limits of EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC[:FREQuency]:OVERlap?
```

Arguments

None

Returns

<Boolean> 0,1

Examples

`SENSE:EMC[:FREQUENCY]:OVERLAP?` might return `1`, indicating that the frequency is overlapped.

SENSe:EMC:LIST

Sets or queries the list of spots to be displayed in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:LIST {ALL | OVER | OLWM}
SENSe:EMC:LIST?
```

Arguments

`ALL` = Sets All spots to be displayed

`OVER` = Sets Over Limit spots to be displayed

`OLWM` = Sets Over Limit with margin spots to be displayed

Returns

<String> See Arguments

Examples

`SENSE:EMC:LIST` might return `ALL`, indicating All spots are displayed.

SENSe:EMC:MARGin

Sets or queries the Margin value in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MARGin <value>
SENSe:EMC:MARGin?
```

Arguments

`<value> = <NR3>`

Returns

<NR3>

Examples

`SENSE:EMC:MARGIN` might return `15`, indicating that the margin value is 15 dB.

SENSe:EMC:MEASurement:AMBIent:DELTa:THREshold

Sets or queries Delta threshold value of Ambient detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:AMBIent:DELTa:THREshold <value>
SENSe:EMC:MEASurement:AMBIent:DELTa:THREshold?
```

Arguments

`<value> = <NRf>`

Returns

<NRf>

Examples

`SENSE:EMC:MEASUREMENT:AMBIENT:DELTA:THRESHOLD` might return `1.00000`, indicating that the Delta threshold value of ambient detection is 1.0 dB.

SENSe:EMC:MEASurement:AMBIent:DETEctor

Sets or queries the detector type of the ambient detector in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:AMBIent:DETEctor <arg>
SENSe:EMC:MEASurement:AMBIent:DETEctor?
```

Arguments

<arg> =

`AVER` = Sets Avg (VRMS) as the detector type

PEAK = Sets +Peak as the detector type

MILSTD = Sets Mil +Peak as the detector type

QUAS = Sets CISPR QPk as the detector type

CPE = Sets CISPR +Pk as the detector type

CAV = Sets CISPR Avg as the detector type

AVGL = Sets Avg (of logs) as the detector type

CAVL = Sets CISPR Avg (of logs) as the detector type

DSA = Sets DEF STAN Avg as the detector type

DSP = Sets DEF STAN Peak as the detector type

Returns

<String> See Argument

Examples

SENSE:EMC:MEASUREMENT:AMBIENT:DETECTOR might return DSP, indicating that the ambient detector type is DEF STAN Peak.

SENSe:EMC:MEASurement:AMBIent:DWELl:TIME

Sets or queries the dwell time of ambient detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:AMBIent:DWELl:TIME <value>
SENSe:EMC:MEASurement:AMBIent:DWELl:TIME?
```

Arguments

<value> = <NRf>

Returns

<NRf>

Examples

SENSE:EMC:MEASUREMENT:AMBIENT:DWELL:TIME might return 329.142E-6, indicating that the dwell time of ambient detection is 329.1 µs.

SENSe:EMC:MEASurement:AMBIent:DWELl:TIME:AUTO

Sets or queries to automatically set the dwell time of ambient detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:AMBIent:DWELl:TIME:AUTO { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:AMBIent:DWELl:TIME:AUTO?
```

Arguments

`0` or `OFF` disables the Auto check box of dwell time

`1` or `ON` enables the Auto check box of dwell time

Returns

<Boolean> 0,1

Examples

`SENSE:EMC:MEASUREMENT:AMBIENT:DWELL:TIME:AUTO?` might return `1`, indicating that the dwell time of ambient detection is set automatically.

SENSe:EMC:MEASurement:AMBIent:STARt (No Query Form)

Starts the ambient detection with respect to selected detector.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:AMBIent:STARt
```

Arguments

None

Returns

None

Examples

`SENSE:EMC:MEASUREMENT:AMBIENT:START SINGle` performs a single ambient scan with respect to the selected scan detector.

SENSe:EMC:MEASurement:INSPect:DETEctor<x>

Sets or queries the detector type for the specified detector in discrete search of EMC View.

<x> = 1 or 2 or 3 specifies detector number

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:DETEctor<x> <arg>
SENSe:EMC:MEASurement:INSPect:DETEctor<x>?
```

Arguments

<arg> =

AVER = Sets Avg (VRMS) as the detector type

PEAK = Sets +Peak as the detector type

MILSTD = Sets Mil +Peak as the detector type

QUAS = Sets CISPR QPk as the detector type

CPE = Sets CISPR +Pk as the detector type

CAV = Sets CISPR Avg as the detector type

AVGL = Sets Avg (of logs) as the detector type

CAVL = Sets CISPR Avg (of logs) as the detector type

DSA = Sets DEF STAN Avg as the detector type

DSP = Sets DEF STAN Peak as the detector type

Returns

<String> See Argument

Examples

SENSe:EMC:MEASurement:INSPect:DETEctor1? might return QUAS, indicating that the detector type for detector 1 in discrete search is CISPR QPk.

SENSe:EMC:MEASurement:INSPect:DETEctor<x>:COMParision:LEVEl

Sets or queries the comparison level value for the specified detector in discrete search of EMC View.

<x> = 1 or 2 or 3 (specifies detector number)

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:DETEctor<x>:COMParision:LEVEl <value>
SENSe:EMC:MEASurement:INSPect:DETEctor<x>:COMParision:LEVEl?
```

Arguments

<value> = <NRf>

Returns

<NRf>

Examples

`SENSe:EMC:MEASurement:INSPect:DETEctor1:COMParision:LEVEl` might return `39.9897`, indicating that the comparison level value of detector 1 is 39.98 dBuV.

SENSe:EMC:MEASurement:INSPect:DETEctor<x>:ENABle

Sets or queries the Enabling or disabling of specified detector in discrete search of EMC View.

<x> = 1 or 2 or 3 (specifies detector number)

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:DETEctor<x>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:DETEctor<x>:ENABle?
```

Arguments

`0` or `OFF` disables the specified detector

`1` or `ON` enables the specified detector

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:MEASurement:INSPect:DETEctor1:ENABle` might return `1`, indicating detector 1 is enabled.

SENSe:EMC:MEASurement:INSPect:DWELl:TIME

Sets or queries the dwell time in discrete search of EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:DWELl:TIME <value>
SENSe:EMC:MEASurement:INSPect:DWELl:TIME?
```

Arguments

<value> = <NRf>

Returns

<NRf>

Examples

SENSE:EMC:MEASUREMENT:INSPECT:DWELL:TIME might return 2.500, indicating that the dwell time is 2.5 s.

SENSe:EMC:MEASurement:INSPect:DWELl:TIME:AUTO

Sets or queries to automatically set the dwell time in discrete search of EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:DWELl:TIME:AUTO { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:DWELl:TIME:AUTO?
```

Arguments

0 or OFF disables the auto check box

1 or ON enables the auto check box

Returns

<Boolean> 0,1

Examples

SENSE:EMC:MEASUREMENT:INSPECT:DWELL:TIME:AUTO might return 0, indicating auto check box is disabled.

SENSe:EMC:MEASurement:INSPect:MODE

Sets or queries the inspect search mode in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE { DISC | HARM }
SENSe:EMC:MEASurement:INSPect:MODE?
```

Arguments

DISC = Sets inspect search to Discrete mode

HARM = Sets inspect search to Harmonic mode

Returns

<String> DISC or HARM

Examples

SENSE:EMC:MEASUREMENT:INSPECT:MODE might return HARM, indicating inspect search is in harmonic search mode.

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:ENABle

Sets or queries the enabling or disabling of the specified row number in discrete search of EMC View.

<x> = <NR1> specifies row number

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:ENABle?
```

Arguments

`0` or `OFF` disables the specified row number

`1` or `ON` enables the specified row number

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency3:ENABle?` might return `1`, indicating that the row 3 is enabled.

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:FREQuency

Sets or queries the frequency value of the specified row number in discrete search of EMC View.

<x> = <NR1> specifies row number

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:FREQuency <value>
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:FREQuency?
```

Arguments

`<value>` = <NRf> frequency value

Returns

<NRf>

Examples

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency2:FREQuency? might return 25.00000E+6, indicating that the frequency value of row 2 is 25.00 MHz.

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:RBW

Sets or queries the RBW value of the specified row number in discrete search of EMC View.

<x> = <NR1> Specifies row number

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:RBW <value>
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:RBW?
```

Arguments

<value> = <NRf> RBW value

Returns

<NRf>

Examples

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency1:RBW? might return 9.00000E+3, indicating that the RBW value of row 1 is 9.00 kHz.

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:RBW:AUTO

Sets or queries the enabling or disabling of Auto RBW check box of the specified row number in discrete search of EMC View.

<x> = <NR1> specifies row number

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:RBW:AUTO { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency<x>:RBW:AUTO?
```

Arguments

0 or OFF disables the Auto check box

1 or ON enables the Auto check box

Returns

<Boolean> 0,1

Examples

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:FREQuency4:RBW:AUTO? might return 1, indicating that the Auto check box for row 4 is enabled.

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:LOAD:EMISsion:RESults (No Query Form)

Loads the frequency spots from Emission results into discrete search table. Only the top 20 spots of emission results will be loaded.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

SENSe:EMC:MEASurement:INSPect:MODE:DISCrete:LOAD:EMISsion:RESults

Arguments

None

Returns

None

Examples

SENSE:EMC:MEASUREMENT:INSPECT:MODE:DISCRETE:LOAD:EMISSION:RESULTS loads the emission results.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:ENABle

Sets or queries to enable or disable the specified harmonic in EMC View.

<x> = 1 or 2 or 3 specifies the harmonic

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:ENABle?

Arguments

0 or OFF disables the specified harmonic

1 or ON enables the specified harmonic

Returns

<Boolean> 0,1

Examples

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic1:ENABle? might return 1, indicating that the harmonic 1 in enabled.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:ENABle

Sets or queries the enabling or disabling harmonic factor of a specified harmonic in EMC View.

<x> = 1 or 2 or 3 specifies the harmonic

<y> = <NR1> (1 to 10) Specifies the harmonic factor

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:ENABle?
```

Arguments

0 or OFF disables the harmonic factor

1 or ON enables the harmonic factor

Returns

<Boolean> 0,1

Examples

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic1:FACTor2:ENABle might return 1, indicating that harmonic factor 2 of harmonic 1 is enabled.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:FREQuency

Sets or queries the frequency value of the specified harmonic and factor in harmonic search of EMC View.

p<x> = 1 or 2 or 3 specifies the harmonic

<y> = <NR1> (1 to 10) specifies the harmonic factor

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:FREQuency <value>
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:FREQuency?
```

Arguments

`<value>` = <NRf> Frequency value

Returns

<NRf>

Examples

`SENSe:EMC:MEASurement:INSPect:MODE:HARMonic1:FACTor2:FREQuency?` might return `25.00000E+6`, indicating that the frequency value of harmonic 1 factor 2 is 25.00 MHz.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:HARMonic:FACTor

Sets or queries the harmonic factor value for the specified harmonic in EMC View.

<x> = 1 or 2 or 3 specifies the harmonic

<y> = <NR1> (1 to 10) Specifies the harmonic factor

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:HARMonic:FACTor <value>
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:HARMonic:FACTor?
```

Arguments

`<value>` =

Either

`OEIG` = 1/8

`QUAR` = 1/4

`HALF` = 1/2

`ONE` = 1

`TWO` = 2

`THREE` = 3

`FOUR` = 4

`FIVE` = 5

`SIX` = 6

`SEVEN` = 7

EIGHT = 8

NINE = 9

TEN = 10

Returns

<String> See Arguments

Examples

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic1:FACTor2:HARMonic:FACTor? might return "HALF", indicating the 2nd harmonic factor value for harmonic 1 is ½.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:RBW

Sets or queries the RBW value of the specified harmonic and factor in harmonic search of EMC View.

<x> = 1 or 2 or 3 specifies the harmonic

<y> = <NR1> (1 to 10) specifies the harmonic factor

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:RBW <value>
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:RBW?
```

Arguments

<value> = <NRf> RBW value

Returns

<NRf>

Examples

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic1:FACTor2:RBW? might return 9.00000E+3, indicating that the RBW value of harmonic 1 factor 2 is 9.00 kHz.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:RBW:AUTO

Sets or queries the enabling and disabling of Auto RBW check box with respect to the specified harmonic and factor in harmonic search of EMC View.

<x> = 1 or 2 or 3 specifies the harmonic

<y> = <NR1> (1 to 10) specifies the harmonic factor

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:RBW:AUTO { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FACTor<y>:RBW:AUTO?
```

Arguments

`0` or `OFF` disables the Auto checkbox

`1` or `ON` enables the Auto checkbox

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:MEASurement:INSPect:MODE:HARMonic2:FACTor1:RBW:AUTO?` might return `1`, indicating that the Auto check box is enabled for harmonic 2 factor 1.

SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FREquency

Sets or queries the frequency of the Specified Harmonic in EMC View.

<x> = 1 or 2 or 3 Specifies the harmonic

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FREquency <value>
SENSe:EMC:MEASurement:INSPect:MODE:HARMonic<x>:FREquency?
```

Arguments

`<value>` = <NRf>

Returns

<NRf>

Examples

`SENSe:EMC:MEASurement:INSPect:MODE:HARMonic1:FREquency` returns `20000`, indicating that the frequency of harmonic 1 is 20 kHz.

SENSe:EMC:MEASurement:INSPect:STARt (No Query Form)

Sets the type of run in inspect section of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

```
Syntax
SENSe:EMC:MEASurement:INSPect:STARt {SINGle | CONTinous | STOP}
```

Arguments

`SINGle` = Performs Single run

`CONTinuous` = Performs a Continuous run

`STOP` = Stops the acquisition

Returns

None

Examples

`SENSE:EMC:MEASUREMENT:INSPECT:START SINGle` sets the inspect mode to perform a single run.

SENSe:EMC:MEASurement:SCAN:DETEctor<x>

Sets or queries the detector type of the specified scan detector in EMC View.

<x> = 1 or 2

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SCAN:DETEctor<x> <arg>
SENSe:EMC:MEASurement:SCAN:DETEctor<x>?
```

Arguments

`<arg>` =

`AVER` = Sets Avg (VRMS) as the detector type

`PEAK` = Sets +Peak as the detector type

`MILSTD` = Sets Mil +Peak as the detector type

`QUAS` = Sets CISPR QPk as the detector type

`CPE` = Sets CISPR +Pk as the detector type

`CAV` = Sets CISPR Avg as the detector type

`AVGL` = Sets Avg (of logs) as the detector type

`CAVL` = Sets CISPR Avg (of logs) as the detector type

`DSA` = Sets DEF STAN Avg as the detector type

`DSP` = Sets DEF STAN Peak as the detector type

Returns

<String> See Arguments

Examples

SENSe:EMC:MEASurement:SCAN:DETEctor1? might return QUAS, indicating that the detector type for scan detector 1 is CISPR QPk.

SENSe:EMC:MEASurement:SCAN:DETEctor<x>:ENABle

Sets or queries the enabling or disabling of the specified scan detector in EMC View.

<x> = 1 or 2

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SCAN:DETEctor<x>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:SCAN:DETEctor<x>:ENABle?
```

Arguments

0 or OFF disables the scan detector

1 or ON enables the scan detector

Returns

<Boolean> 0,1

Examples

SENSe:EMC:MEASurement:SCAN:DETEctor1:ENABle? might return 1, indicating that scan detector 1 is enabled.

SENSe:EMC:MEASurement:SCAN:DETEctor<x>:LIMit

Sets or queries the limit of specified scan detector in EMC View.

<x> = 1 or 2

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SCAN:DETEctor<x>:LIMit <arg>
SENSe:EMC:MEASurement:SCAN:DETEctor<x>:LIMit?
```

Arguments

<arg> = Either ONE , TWO or THREE

ONE = Sets Limit to Limit 1

TWO = Sets Limit to Limit 2

THREE = Sets Limit to Limit 3

Returns

<String>See Argument

Examples

SENSe:EMC:MEASurement:SCAN:DETEctor1:LIMit? might return TWO, indicating that the limit selected for scan detector 1 is Limit 2.

SENSe:EMC:MEASurement:SCAN:DWELI:TIME

Sets or queries the dwell time of scan detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SCAN:DWELl:TIME <value>
SENSe:EMC:MEASurement:SCAN:DWELl:TIME?
```

Arguments

<value> = <NRf>

Returns

<NRf>

Examples

SENSE:EMC:MEASUREMENT:SCAN:DWELL:TIME? might return 640.315E-3, indicating the dwell time of scan detection is 640.3 ms.

SENSe:EMC:MEASurement:SCAN:DWELI:TIME:AUTO

Sets or queries to automatically set the dwell time of scan detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SCAN:DWELl:TIME:AUTO { 0 | OFF | 1 |ON}
SENSe:EMC:MEASurement:SCAN:DWELl:TIME:AUTO?
```

Arguments

0 or OFF disables the Auto check box of dwell time

1 or ON enables the Auto check box of dwell time

Returns

<Boolean> 0,1

Examples

SENSE:EMC:MEASUREMENT:SCAN:DWELL:TIME:AUTO? might return 1, indicating that the dwell time of scan detection is set automatically.

SENSe:EMC:MEASurement:SCAN:STARt (No Query Form)

Starts the scan on the signal with respect to selected scan detector and displays the measurement values.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SCAN:STARt {SINGle | CONTinuous | STOP}
```

Arguments

SINGle = Performs a Single scan

CONTinuous = Performs a Continuous scan

STOP = Stops the acquisition

Returns

None

Examples

SENSE:EMC:MEASUREMENT:SCAN:START SINGle performs a Single scan with respect to the selected scan detector.

SENSe:EMC:MEASurement:SPOT:ALL

Sets or queries to enable or disable All check box to include all spots for spot analysis.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:ALL { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:SPOT:ALL?
```

Arguments

0 or OFF disables the All check box

1 or ON enables the All check box

Returns

<Boolean> 0,1

Examples

SENSE:EMC:MEASUREMENT:SPOT:ALL? might return 1, indicating that all spots are included for spot analysis.

SENSe:EMC:MEASurement:SPOT:COUNt

Sets or queries the Maximum number of spots required for spot Analysis in EMC View. Applies only to Pre-scan + Auto spot measurement type.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:COUNt <value>
SENSe:EMC:MEASurement:SPOT:COUNt?
```

Arguments

<value> = <NRf>

Returns

<NRf>

Examples

SENSE:EMC:MEASUREMENT:SPOT:COUNT? might return 20, indicating 20 spots to be selected for spot analysis.

SENSe:EMC:MEASurement:SPOT:DETEctor<x>

Sets or queries the detector type of the specified spot detector in EMC View.

<x> = 1 or 2 or 3

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:DETEctor<x> <arg>
SENSe:EMC:MEASurement:SPOT:DETEctor<x>?
```

Arguments

<arg> =

AVER = Sets Avg (VRMS) as the detector type

PEAK = Sets +Peak as the detector type

MILSTD = Sets Mil +Peak as the detector type

QUAS = Sets CISPR QPk as the detector type

CPE = Sets CISPR +Pk as the detector type

CAV = Sets CISPR Avg as the detector type

AVGL = Sets Avg (of logs) as the detector type

CAVL = Sets CISPR Avg (of logs) as the detector type

DSA = Sets DEF STAN Avg as the detector type

DSP = Sets DEF STAN Peak as the detector type

Returns

<String> See Argument

Examples

SENSe:EMC:MEASurement:SPOT:DETEctor1? might return QUAS, indicating that the spot detector type for detector 1 is CISPR QPk.

SENSe:EMC:MEASurement:SPOT:DETEctor<x>:ENABle

Sets or queries the enabling and disabling of specified spot detector in EMC View.

<x> = 1 or 2 or 3

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:DETEctor<x>:ENABle { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:SPOT:DETEctor<x>:ENABle?
```

Arguments

0 or OFF disables the spot detector

1 or ON enables the spot detector

Returns

<Boolean> 0,1

Examples

SENSe:EMC:MEASurement:SPOT:DETEctor1:ENABle? might return 1, indicating that spot detector 1 is enabled.

SENSe:EMC:MEASurement:SPOT:DETEctor<x>:LIMit

Sets or queries the limit of specified spot detector in EMC View.

<x> = 1 or 2 or 3

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:DETEctor<x>:LIMit <arg>
SENSe:EMC:MEASurement:SPOT:DETEctor<x>:LIMit?
```

Arguments

<arg> = Either ONE , TWO or THREE

ONE = Sets Limit to Limit 1

TWO = Sets Limit to Limit 2

THREE = Sets Limit to Limit 3

Returns

<String> See Argument

Examples

SENSe:EMC:MEASurement:SPOT:DETEctor2:LIMit? might return ONE, indicating that the limit selected for spot detector 2 is Limit 1.

SENSe:EMC:MEASurement:SPOT:DWELI:TIME

Sets or queries the dwell time of spot detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:DWELl:TIME <value>
SENSe:EMC:MEASurement:SPOT:DWELl:TIME?
```

Arguments

<value> = <NRf>

Returns

<NRf>

Examples

SENSE:EMC:MEASUREMENT:SPOT:DWELL:TIME? might return 1.000000, indicating that the dwell time of spot detection is 1 s.

SENSe:EMC:MEASurement:SPOT:DWELl:TIME:AUTO

Sets or queries to automatically set the dwell time of spot detection in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:DWELl:TIME:AUTO { 0 | OFF | 1 | ON}
SENSe:EMC:MEASurement:SPOT:DWELl:TIME:AUTO?
```

Arguments

`0` or `OFF` disables the Auto check box of dwell time

`1` or `ON` enables the Auto check box of dwell time

Returns

<Boolean> 0,1

Examples

`SENSE:EMC:MEASUREMENT:SPOT:DWELL:TIME:AUTO?` might return `1`, indicating that the dwell time of spot detection is set automatically.

SENSe:EMC:MEASurement:SPOT:STARt (No Query Form)

Starts the spot re-measurement on the selected spots with respect to selected spot detector.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:SPOT:STARt
```

Arguments

None

Returns

None

Examples

`SENSE:EMC:MEASUREMENT:SPOT:START` starts spot re-measurement on the selected spots.

SENSe:EMC:MEASurement:TYPE

Sets or queries the measurement type in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MEASurement:TYPE {PSMS | PSAS | CS}
SENSe:EMC:MEASurement:TYPE?
```

Arguments

`PSMS` = Sets Pre-scan+ Manual Spot as measurement type.

`PSAS` = Sets Pre-scan+ Auto Spot as measurement type.

`CS` = Sets Complete scan as measurement type.

Returns

<String> PSMS or PSAS or CS

Examples

`SENSE:EMC:MEASUREMENT:TYPE` might return `CS`, indicating that Complete scan is the measurement type selected.

SENSe:EMC:MODE

Sets or queries the frequency ranges (mode) in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:MODE {MULT | SING}
SENSe:EMC:MODE?
```

Arguments

`MULT` = Sets multiple as frequency range

`SING` = Sets Single as frequency range

Returns

<String> MULT or SING

Examples

`SENSE:EMC:MODE?` might return `SING`, indicating that the frequency range is Single.

SENSe:EMC:OPTimization

Sets or queries the method of optimizing the gain and input bandwidth in the EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:OPTimization { AUTO | MINTime | MAXDynrange | MINNoise }
SENSe:EMC:OPTimization?
```

Arguments

`AUTO` = optimizes automatically the gain and input bandwidth.

`MINTime` = optimizes the gain and input bandwidth to minimize sweep time.

`MAXDynrange` = optimizes the gain and input bandwidth to maximize the dynamic range.

`MINNoise` = optimizes the gain and input bandwidth to minimize noise.

Returns

<String> See Argument

Examples

`SENSe:EMC:OPTIMIZATION AUTO` optimizes automatically the gain and input bandwidth.

SENSe:EMC:POINts:COUNt

Sets or queries the trace points value in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:POINts:COUNt {P801 | P2401 | P4001 | P8001 | P10401 | P16001 | P32001 | P64001}
SENSe:EMC:POINts:COUNt?
```

Arguments

`P801` = Sets 801 as trace point value.

`P2401` = Sets 2401 as trace point value.

`P4001` = Sets 4001 as trace point value.

`P8001` = Sets 8001 as trace point value.

`P10401` = Sets 10401 as trace point value.

`P16001` = Sets 16001 as trace point value.

`P32001` = Sets 32001 as trace point value.

`P64001` = Sets 64001 as trace point value.

Returns

<String> See Arguments

Examples

`SENSe:EMC:POINTS:COUNT P2401` sets `2401` as trace point value in EMC view.

SENSe:EMC:RANGe<x>:BANDwidth:VIDeo

Sets or queries the (Video Bandwidth) VBW value of selected range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:BANDwidth:VIDeo <value>
SENSe:EMC:RANGe<x>:BANDwidth:VIDeo?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

`SENSe:EMC:RANGe1:BANDwidth:VIDeo?` might return `1.0000000E+6`, indicating that the VBW value of range 1 is 1 MHz.

SENSe:EMC:RANGe<x>:BANDwidth:VIDeo:STATe

Sets or queries the enabling or disabling the (Video state) VBW check box of specified range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:BANDwidth:VIDeo:STATe { 0 | OFF | 1 | ON}
SENSe:EMC:RANGe<x>:BANDwidth:VIDeo:STATe?
```

Arguments

`0` or `OFF` disables the VBW check box

`1` or `ON` enables the VBW check box

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:RANGe2:BANDwidth:VIDeo:STATe?` might return `0`, indicating that VBW check box is disabled for range 2.

SENSe:EMC:RANGe<x>:EXCursion

Sets or queries the excursion value of the specified range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:EXCursion <value>
SENSe:EMC:RANGe<x>:EXCursion?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

`SENSe:EMC:RANGe1:EXCursion?` might return `6.0000`, indicating that the threshold value of range 1 is 6 dB.

SENSe:EMC:RANGe<x>:FILTer[:SHAPe]:BANDwidth

Sets or queries the (Resolution Bandwidth) RBW value of selected range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:FILTer[:SHAPe]:BANDwidth <value>
SENSe:EMC:RANGe<x>:FILTer[:SHAPe]:BANDwidth?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

`SENSe:EMC:RANGe1:FREQuency:STOP?` might return `9.00`, indicating that the RBW value of range 1 is 9 kHz.

SENSe:EMC:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO

Sets or queries the Enabling or disabling of RBW Auto checkbox of selected range to set RBW value automatically in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO { 0 | OFF |1 | ON}
SENSe:EMC:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO?
```

Arguments

`0` or `OFF` disables the Auto check box

`1` or `ON` enables the Auto check box

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:RANGe0:FREQuency:STOP?` might return `0`, indicating that Auto check box is disabled.

SENSe:EMC:RANGe<x>:FREQuency:STARt

Sets or queries the Start frequency of the specified range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:FREQuency:STARt <value>
SENSe:EMC:RANGe<x>:FREQuency:STARt?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

SENSe:EMC:RANGe1:FREQuency:STARt? might return 150000, indicating that the start frequency of range 1 is 150 kHz.

SENSe:EMC:RANGe<x>:FREQuency:STOP

Sets or queries the stop frequency of selected range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:FREQuency:STOP <value>
SENSe:EMC:RANGe<x>:FREQuency:STOP?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

SENSe:EMC:RANGe1:FREQuency:STOP? might return 500000, indicating that the stop frequency of range 1 is 500 kHz.

SENSe:EMC:RANGe<x>:LIMit<y>:EQUAl

Sets or queries whether limit start and stop value of selected range and limit are the same in EMC View.

<x> = <NR1> 1 to 20

<y> = <NR1> Either Limit 1 or 2 or 3

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:LIMit<y>:EQUAl { 0 | OFF | 1 | ON}
SENSe:EMC:RANGe<x>:LIMit<y>:EQUAl?
```

Arguments

0 or OFF disables the Limit same check box

1 or ON enables the Limit same check box

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:RANGe1:LIMit1:EQUAl?` might return `1`, indicating the Limit 1 start and stop value for range 2 are the same.

SENSe:EMC:RANGe<x>:LIMit<y>:STARt

Sets or queries the Limit start value of the specified range and specified limit in EMC View.

<x> = <NR1> 1 to 20

<y> = <NR1> Either Limit 1 or 2 or 3

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:LIMit<y>:STARt <value>
SENSe:EMC:RANGe<x>:LIMit<y>:STARt?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

`SENSe:EMC:RANGe1:LIMit1:STARt?` might return `79.0000`, indicating that the Limit 1 start value of range 1 is 79 dBuV.

SENSe:EMC:RANGe<x>:LIMit<y>:STOP

Sets or queries the Limit stop value of the specified range and specified limit in EMC View.

<x> = <NR1> 1 to 20

<y> = <NR1> Either Limit 1 or 2 or 3

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:LIMit<y>:STOP <value>
SENSe:EMC:RANGe<x>:LIMit<y>:STOP?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

`SENSe:EMC:RANGe1:LIMit1:STOP?` might return `79.0000`, indicating that the Limit 1 stop value of range 1 is 79 dBuV.

SENSe:EMC:RANGe<x>:STATe

Sets or queries Enabling and disabling the selected range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:STATe { 0 | OFF | 1 | ON}
SENSe:EMC:RANGe<x>:STATe?
```

Arguments

`0` or `OFF` disables the range

`1` or `ON` enables the range

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:RANGe2:STATe?` might return `0`, indicating that range 2 is disabled.

SENSe:EMC:RANGe<x>:THReshold

Sets or queries the threshold value of the specified range in EMC View.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:RANGe<x>:THReshold <value>
SENSe:EMC:RANGe<x>:THReshold?
```

Arguments

<value> = <NR3>

Returns

<NR3>

Examples

`SENSe:EMC:RANGe1:THReshold?` might return `46.0000`, indicating that the threshold value of range 1 is 46 dBuV.

SENSe:EMC:REGion

Sets or queries the region of standard in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REGion {EURO | US}
SENSe:EMC:REGion?
```

Arguments

`EURO` = Sets Europe as the region

`US` = Sets US as the region

Returns

<String> See Argument

Examples

`SENSe:EMC:REGION?` might return `US`, indicating that the region selected is US.

SENSe:EMC:REPOrt:INCLude:CONTrol:SETTings

Sets or queries to include or exclude control settings in report by enabling or disabling include control settings check box in report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:CONTrol:SETTings { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:CONTrol:SETTings?
```

Arguments

`0` or `OFF` exclude the control settings in report

`1` or `ON` include the control settings in report

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:REPORT:INCLUDE:CONTROL:SETTINGS?` might return `1`, indicating that control settings is included in report.

SENSe:EMC:REPOrt:INCLude:EMISsion:RESUlts

Sets or queries to include or exclude emission results in report by enabling or disabling include emission results check box in report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:EMISsion:RESUlts { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:EMISsion:RESUlts?
```

Arguments

`0` or `OFF` exclude emission results in report

`1` or `ON` include emission results in report

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:REPORT:INCLUDE:EMISSION:RESULTS?` might return `1`, indicating that emission results is included in report.

SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation

Sets or queries to include or exclude environment information in report by enabling or disabling environment information check box in report setup of EMC display.

<x> = <NR1> 1 to 20

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation?
```

Arguments

`0` or `OFF` exclude environment information in report

1 or ON include environment information in report

Returns

<Boolean> 0,1

Examples

SENSe:EMC:REPORT:INCLUDE:ENVIRONMENT:INFORMATION? might return 1, indicating that environment information is included in report.

SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation:ADD (No Query Form)

Adds one Environment information content by adding one title and its corresponding value in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation:ADD "Title","Value"

Arguments

Title = <String>

Value = <String>

Returns

None

Examples

SENSe:EMC:REPORT:INCLUDE:ENVIRONMENT:INFORMATION:ADD "Temperature","20" adds the environment information temperature and its value as 20 in the report.

SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation:DELete:ALL (No Query Form)

Deletes all the environment information in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

SENSe:EMC:REPOrt:INCLude:ENVIronment:INFOrmation:DELete:ALL

Arguments

None

Returns

None

Examples

`SENSe:EMC:REPORT:INCLUDE:ENVIRONMENT:INFORMATION:DELETE:ALL` deletes all the environment information in the report.

SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation

Sets or queries to include or exclude EUT (Equipment under test) information in report by enabling or disabling EUT information check box in report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation?
```

Arguments

`0` or `OFF` exclude EUT information in report

`1` or `ON` include EUT information in report

Returns

<Boolean> 0,1

Examples

`SENSe:EMC:REPORT:INCLUDE:EUT:INFORMATION?` might return `0`, indicating that EUT information is excluded in report.

SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation:ADD (No Query Form)

Adds one EUT information content by adding one tittle and its corresponding value in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation:ADD "Title","Value"
```

Arguments

Title = <String>

Value = <String>

Returns

None

Examples

`SENSe:EMC:REPORT:INCLUDE:EUT:INFORMATION:ADD "Serial Number","ABC156"` adds the EUT information Serial Number and its value as ABC156 in the report.

SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation:DELete:ALL (No Query Form)

Deletes all the EUT information in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

`SENSe:EMC:REPOrt:INCLude:EUT:INFOrmation:DELete:ALL`

Arguments

None

Returns

None

Examples

`SENSe:EMC:REPORT:INCLUDE:EUT:INFORMATION:DELETE:ALL` deletes all the EUT information in the report.

SENSe:EMC:REPOrt:INCLude:GRAPh

Sets or queries to include or exclude graph of measurement results in report by enabling or disabling include graph check box in report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:GRAPh { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:GRAPh?
```

Arguments

0 or OFF exclude the graph in report

1 or ON include the graph in report

Returns

<Boolean> 0,1

Examples

SENSe:EMC:REPORT:INCLUDE:GRAPH? might return 0, indicating that graph is excluded in report.

SENSe:EMC:REPOrt:INCLude:INSPect:FREQuency:RESUlts

Sets or queries to include or exclude inspect frequency results in report by enabling or disabling include inspect req results check box in report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:INSPect:FREQuency:RESUlts { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:INSPect:FREQuency:RESUlts?
```

Arguments

0 or OFF exclude inspect frequency results in report

1 or ON include inspect frequency results in report

Returns

<Boolean> 0,1

Examples

SENSe:EMC:REPORT:INCLUDE:INSPECT:FREQUENCY:RESULTS? might return 0, indicating that inspect frequency results is excluded in report.

SENSe:EMC:REPOrt:INCLude:USER:INFOrmation

Sets or queries to include or exclude user information in report by enabling or disabling user information check box in report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:INCLude:USER:INFOrmation { 0 | OFF | 1 | ON}
SENSe:EMC:REPOrt:INCLude:USER:INFOrmation?
```

Arguments

0 or OFF exclude user information in report

1 or ON include user information in report

Returns

<Boolean> 0,1

Examples

SENSe:EMC:REPORT:INCLUDE:USER:INFORMATION? might return 1, indicating that user information is included in report.

SENSe:EMC:REPOrt:INCLude:USER:INFOrmation:ADD (No Query Form)

Adds one user information content by adding one title and its corresponding value in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

SENSe:EMC:REPOrt:INCLude:USER:INFOrmation:ADD "Title","Value"

Arguments

Title = <String>

Value = <String>

Returns

None

Examples

SENSe:EMC:REPORT:INCLUDE:USER:INFORMATION:ADD "Engineer","xyz" adds the user information engineer and its value as xyz in the report.

SENSe:EMC:REPOrt:INCLude:USER:INFOrmation:DELete:ALL (No Query Form)

Deletes all the user information in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

SENSe:EMC:REPOrt:INCLude:USER:INFOrmation:DELete:ALL

Arguments

None

Returns

None

Examples

SENSe:EMC:REPORT:INCLUDE:USER:INFORMATION:DELETE:ALL deletes all the user information in the report.

SENSe:EMC:REPOrt:MEASurement:HEADing

Sets or queries the measurement heading in the report setup of EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:REPOrt:MEASurement:HEADing <value>
SENSe:EMC:REPOrt:MEASurement:HEADing?
```

Arguments

<value> = <String>

Returns

<String>

Examples

SENSe:EMC:REPORT:MEASUREMENT:HEADING? might return “spot”, indicating that the measurement heading of the report is spot.

SENSe:EMC:STANdard

Sets or queries the standard in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Sense commands

Syntax

```
SENSe:EMC:STANdard <arg>
SENSe:EMC:STANdard?
```

Arguments

When the region is US

`<arg> = {FCC Part 15 | FCC Part 18 | MIL-STD 461G}`

When the region is Europe

`<arg> = {EN55011 | EN55013| EN55014 | EN55015 | EN55025 | EN55032 | EN60601 | DEF STAN | EN61000}`

Returns

<String> See Argument

Examples

`SENSe:EMC:STANDARD FCC Part 15` sets FCC Part 15 as the standard.

[SENSe]:FDVTime[:MEASview<y>]:SELEcted:SOURce

Sets or queries the source of Frequency deviation versus Time for a selected measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Frequency deviation versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Frequency deviation versus Time).

The source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:FDVTime[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:FDVTime[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents the measurement index based on the number of sources of connected instrument, where the MEASview keyword is optional by default and y is 1.

Examples

`SENSe:FDVTime:MEASview<y>:SELECTED:SOURce?` queries the Source for Frequency deviation versus Time measurement view 1.

[SENSe]:{FM|PM}:BURSt:THReshold

Sets or queries the threshold level above which the input signal is determined to be a burst in the FM/PM measurement. The burst detected first is used for the measurement.

Conditions

Measurement views: FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{FM|PM}:BURSt:THReshold <value>
[SENSe]:{FM|PM}:BURSt:THReshold?
```

Arguments

`<value>::<NRf>` specifies the threshold level. Range: –100.0 to –10.0 dB.

Returns

<Boolean> 0,1

Examples

`SENSE:FM:BURST:THRESHOLD -10` sets the threshold level to –10 dB in the FM measurement.

[SENSe]:{FM|PM}:FREQuency:OFFSet

Sets or queries the carrier frequency offset in the FM/PM measurement.

Conditions

Measurement views: FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{FM|PM}:FREQuency:OFFSet <value>
[SENSe]:{FM|PM}:FREQuency:OFFSet?
```

Arguments

`<value>::<NRf>` specifies the frequency offset from the center frequency. Range: -(MeasBW*1.1)/2 to +(MeasBW*1.1)/2 where MeasBW is set by the command `[SENSe]:{AM|FM|PM}:{BANDwidth|BWIDth}:MEASurement`.

Examples

`SENSE:FM:FREQUENCY:OFFSET 10MHZ` sets the carrier frequency offset to 10 MHz.

[SENSe]:{FM|PM}:FREQuency:OFFSet:MARKer (No Query Form)

Sets the frequency offset from the selected marker location in the FM measurement.

Sets the frequency offset from the selected delta marker location in the PM measurement.

Conditions

Measurement views: FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{FM|PM}:FREQuency:OFFSet:MARKer
```

Arguments

None

Examples

SENSE:FM:FREQUENCY:OFFSET:MARKER sets frequency offset from the selected Marker position.

[SENSe]:{FM|PM}:FREQuency:SEARch:AUTO

Determines whether to detect the carrier frequency automatically or manually in the FM/PM measurements.

Conditions

Measurement views: FM, PM

Group

Sense commands

Syntax

```
[SENSe]:{FM|PM}:FREQuency:SEARch:AUTO { OFF | ON | 0 | 1 }
[SENSe]:{FM|PM}:FREQuency:SEARch:AUTO?
```

Arguments

OFF or 0 specifies that the carrier frequency is set manually. Use the command [SENSe]:{FM|PM}:FREQuency:OFFSet to set the carrier offset frequency.

ON or 1 specifies that the carrier frequency is detected automatically.

Examples

SENSE:FM:FREQUENCY:SEARCH:AUTO ON specifies that the carrier frequency is detected automatically.

[SENSe]:{FSETtling|PSETtling}:{BANDwidth|BWIDTH}

Sets or queries the measurement bandwidth for the Settling Time measurements.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:{BANDwidth|BWIDTH} <value>
[SENSe]:{FSETtling|PSETtling}:{BANDwidth|BWIDTH}?
```

Related Commands

FETCh:{AM|FM|PM}? (on page 1112)

READ:AM:RESult? (on page 1608)

Arguments

<value>::<NRf> specifies the bandwidth for the specified settling time measurement.

Examples

SENSE:FSETTLING:BANDwidth 1e6 sets the Frequency Settling time measurement bandwidth to 1 MHz.

[SENSe]:{FSETtling|PSETtling}:{BANDwidth|BWIDTH}:ACTual? (Query Only)

Queries the actual measurement bandwidth in the Settling Time measurements.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:{BANDwidth|BWIDTH}:ACTual?
```

Arguments

None

Returns

<NRf> The actual measurement bandwidth in Hz.

Examples

SENSE:FSETTLING:BANDWIDTH:ACTUAL? might return 40.000E+6, indicating that the actual RBW is 40.00 MHz.

[SENSe]:{FSETtling|PSETtling}:FREQuency:CENTer

Sets or queries the measurement frequency.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:FREQuency:CENTer <value>
[SENSe]:{FSETtling|PSETtling}:FREQuency:CENTer?
```

Arguments

<value>::<NRf> specifies the measurement frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

SENSe:PSETTLING:FREQUENCY:CENTER 7.5GHz sets the Phase Settling Time measurement frequency to 7.5 GHz.

[SENSe]:{FSETtling|PSETtling}:FREQuency:OFFSet

Sets or queries the offset frequency.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:FREQuency:OFFSet <value>
[SENSe]:{FSETtling|PSETtling}:FREQuency:OFFSet?
```

Arguments

`<value>::<NRf>` specifies the offset frequency.

Range: ± (0.5 × Measurement bandwidth)

Default: 0 Hz.

Examples

`SENSe:PSETTLING:FREQUENCY:OFFSET 20E6` sets the Phase Settling Time offset frequency to 20 MHz.

[SENSe]:{FSETtling|PSETtling}:LENGth

Sets or queries the measurement length.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:LENGth <value>
[SENSe]:{FSETtling|PSETtling}:LENGth?
```

Arguments

`<value>::<NRf>` specifies the measurement length in seconds.

Range: 10 ns to [(acquisition length) - 400 ns].

If [(analysis start) + (analysis length)] > [(acquisition length) - 400 ns], the actual measurement length is reduced to [(acquisition length) - 200 ns].

Default: 1 ms.

Examples

`SENSe:PSETTLING:LENGTH 25.625us` sets the measurement length to 25.625 µs.

[SENSe]:{FSETtling|PSETtling}:LENGth:ACTual? (Query Only)

Queries the actual measurement length for the Settling Time measurements.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:LENGth:ACTual?
```

Arguments

None

Returns

<NRf> The actual measurement length in Hz.

Examples

SENSe:FSETTLING:LENGTH:ACTUAL? might return 25.625E-6, indicating that the actual measurement length is 25.625 µs.

[SENSe]:{FSETtling|PSETtling}:MASK:LIMit

Sets or queries the frequency or phase limit for the specified region.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:MASK:LIMit <x> <value>
[SENSe]:{FSETtling|PSETtling}:MASK:LIMit <x>?
```

Arguments

<x>::= { 1 | 2 | 3} specifies the mask region.

<value>::<NRf> specifies the frequency or phase limit for the region.

For Frequency Settling Time:

- Range: 1 Hz to 1 GHz
- Default: 500 kHz

For Phase Settling Time:

- Range: 0.1 degree to 180 degrees
- Default: 1 degree

Examples

SENSe:FSETTLING:MASK:LIMIT2 7.5E5 sets the limit for region 2 to 750 kHz.

[SENSe]:{FSETtling|PSETtling}:MASK:STATe

Sets or queries mask test state.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:MASK:STATe { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or `0` enables Mask test.

`ON` or `1` disables Mask test.

Examples

`SENSe:FSETTLING:MASK:STATE ON` enables mask test.

[SENSe]:{FSETtling|PSETtling}:MASK:TIME:REFerence

Sets or queries the mask time reference.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

```
Syntax
[SENSe]:{FSETtling|PSETtling}:MASK:TIME:REFerence { TRIGger | TRANsition }
```

Arguments

`TRIGger` specifies that the trigger point service as the mask time reference.

`TRANsition` specifies that the point where the signal transitions out of the previous tolerance range serves as the mask time reference.

Default: Trigger

Examples

`SENSe:FSETTLING:MASK:TIME:REFerence TRIGGER` specifies that the trigger point serve as the mask time reference.

[SENSe]:{FSETtling|PSETtling}:MASK:TIME:STARt

Sets or queries the mask region start time in seconds.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:MASK:TIME:STARt <x> <value>
[SENSe]:{FSETtling|PSETtling}:MASK:TIME:STARt <x>?
```

Arguments

`<x>::= { 1 | 2 | 3}` specifies the mask region.

`<value>::<NRf>` specifies the start time of the mask region in seconds.

Examples

`SENSe:FSETTLING:MASK:TIME:START3?` might return `1.0000E-3` as the start time for mask region 3.

[SENSe]:{FSETtling|PSETtling}:MASK:TIME:STOP

Sets or queries the mask region stop time in seconds.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:MASK:TIME:STOP <value>
[SENSe]:{FSETtling|PSETtling}:MASK:TIME:STOP <x>?
```

Arguments

`<value>::<NRf>` specifies the stop time of the mask in seconds.

Examples

`SENSe:FSETTLING:MASK:TIME:STOP?` might return `6.244120000E-3` as the mask stop time.

[SENSe]:{FSETtling|PSETtling}:MAXTracepoints

Sets or queries the maximum trace points in the Settling Time measurements.

Conditions

Measurement views: Frequency and Phase Settling

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:MAXTracepoints { ONEK | TENK | HUNDredk | NEVerdecimate }
[SENSe]:{FSETtling|PSETtling}:MAXTracepoints?
```

Arguments

`ONEK` sets the maximum trace points to 1 k.

TENK sets the maximum trace points to 10 k.

HUNDredk sets the maximum trace points to 100 k.

NEVerdecimate never decimates the trace points.

Examples

SENSe:PSETTLING:MAXTRACEPOINTS TENK sets the maximum trace points to 10 k.

[SENSe]:{FSETtling|PSETtling}:SDURation:MINimum

Sets or queries the minimum settled duration in seconds. This duration time determines the result of :FETCh:{FSETtling | PSETtling}:SLMSd[:PASS]?.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:SDURation:MINimum <value>
[SENSe]:{FSETtling|PSETtling}:SDURation:MINimum?
```

Arguments

<value>::<NRf> specifies the minimum settled duration in seconds.

Examples

SENSe:FSETTLING:SDURATION:MINIMUM 17.73E-3 sets the minimum settled duration to 17.73 ms.

[SENSe]:{FSETtling|PSETtling}:TARGet:REFerence

Sets or queries the target reference frequency.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:TARGet:REFerence { AUTO | MFReq }
[SENSe]:{FSETtling|PSETtling}:TARGet:REFerence?
```

Arguments

AUTO causes the instrument to determine the target reference value by averaging at least the last 256 samples at the end of the measurement period.

MFReq specifies that the Measurement Frequency value is used as the target reference frequency.

Default: AUTO

Examples

SENSe:FSETTLING:TARGET:REFERENCE MFREQ specifies that the target reference frequency is the measurement frequency.

[SENSe]:{FSETtling|PSETtling}:TOLerance

Sets or queries the frequency or phase range into which the signal must settle.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Sense commands

Syntax

```
[SENSe]:{FSETtling|PSETtling}:TOLerance <value>
[SENSe]:{FSETtling|PSETtling}:TOLerance?
```

Arguments

<value>::<NRf> specifies the frequency or phase range.

For Frequency Settling Time:

- Range: 1 Hz to 1 GHz
- Default: 500 kHz

For Phase Settling Time:

- Range: 0.1 degree to 180 degrees
- Default: 1 degree

Examples

SENSe:FSETTLING:TOLERANCE 2.5E5 sets the tolerance to 250 kHz.

[SENSe]:FVTime[:MEASview<y>]:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:CLEar:RESults
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

SENSe:FVTIME:MEASview1:CLEAR:RESULTS restarts multi-trace functions.

[SENSe]:FVTime[:MEASview<y>]:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: Frequency versus Time.

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}`

`[SENSe]:FVTime[:MEASview<y>]:COLor?`

Arguments

The following table lists the arguments.

Argument	Description
`RED`	Red
`GREen`	Green
`BLUe`	Blue
`CYAN`	Cyan
`BCYan`	Binary cyan
`YELLow`	Yellow
`MAGenta`	Magenta
`GRAY`	Gray
`TEMPerature`	Temperature
`SPECtral`	Spectral

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:FVTIME:COLOR TEMPERATURE` selects the temperature color palette.

[SENSe]:FVTime[:MEASview<y>]:COLor:MAXimum

Sets or queries the maximum value of the color axis in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time.

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:COLor:MAXimum <value>`

`[SENSe]:FVTime[:MEASview<y>]:COLor:MAXimum?`

Arguments

`<value> =::<NRf>` specifies the maximum value of the color axis.

Range: The minimum value to 100%.

The minimum value is set using the `[SENSe]:FVTime[:MEASview<y>]:COLor:MINimum` command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:FVTIME:COLOR:MAXIMUM 90` sets the maximum value of the color axis to 90%.

[SENSe]:FVTime[:MEASview<y>]:COLor:MINimum

Sets or queries the minimum value of the color axis in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:COLor:MINimum <value>`

`[SENSe]:FVTime[:MEASview<y>]:COLor:MINimum?`

Arguments

`<value>=<NRf>` specifies the minimum value of the color axis.

Range: 0% to the maximum value.

The maximum value is set using the `[SENSe]:FVTime[:MEASview<y>]:COLor:MAXimum` command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:FVTIME:COLOR:MINIMUM 10` sets the minimum value of the color axis to 10%.

[SENSe]:FVTime[:MEASview<y>]:COLor:REVerse[:STATe]

Determines whether to reverse the color palette in the Frequency versus Time view. When reversed, the highest density takes the color normally used for the lowest.

Conditions

Measurement views: Frequency versus Time.

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:COLor:REVerse[:STATe] {OFF | ON | 0 | 1}`

`[SENSe]:FVTime[:MEASview<y>]:COLor:REVerse[:STATe]?`

Arguments

`OFF` or `0` uses the color palette in its normal order.

`ON` or `1` reverses the color palette.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:FVTIME:COLOR:REVERSE:STATE ON` reverses the color palette.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:CENTer

Sets or queries the center frequency in the Frequency versus Time measurement.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:CENTer <value>
[SENSe]:FVTime[:MEASview<y>]:FREQuency:CENTer?
```

Related Commands

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STARt (on page 2186)

[SENSe]:FVTime:MEASview<y>:FREQuency:STOP (on page 2187)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<value>::<NRf>` specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:FVTIME:MEASview1:FREQUENCY:CENTER 7.5GHz` sets the center frequency to 7.5 GHz.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:SPAN

Sets or queries the frequency span in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:SPAN <value>
[SENSe]:FVTime[:MEASview<y>]:FREQuency:SPAN?
```

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<value>::<NRf>` is the frequency span.

Range: 10 Hz to 40 MHz (Standard) / 110MHz (Option 110)

Examples

`SENSe:FVTIME:MEASview1:FREQUENCY:SPAN 20MHz` sets the span to 20 MHz.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:SPAN:LINK

Sets or queries if frequency span is linked or not in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:SPAN:LINK <value>
[SENSe]:FVTime[:MEASview<y>]:FREQuency:SPAN:LINK?
```

Arguments

`OFF` or `0` specifies that Link to Span is not checked.

`ON` or `1` specifies that Link to Span is checked .

Examples

`SENSe:FVTime:MEASview1:FREQuency:SPAN:LINK?` might return 0 or 1 based on condition of Link to Span checkbox.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STARt

Sets or queries the measurement start frequency (left edge on the graph) in the Frequency versus Time measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the `[SENSe]:FVTime[:MEASview<y>]:FREQuency:CENTer` command.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STARt <value>
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STARt?
```

Related Commands

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STOP (on page 2187)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<value>::<NRf>` is the measurement start frequency.

Range: (center frequency) ± (span)/2.

Examples

`SENSe:FVTIME:MEASview1:FREQUENCY:START 6.95GHz` sets the start frequency to 6.95 GHz.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP

Sets or queries the frequency step size (the amount per press by which the up or down key changes the setting value). Programming a specified step size sets `[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP:AUTO OFF`.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP <value>
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP?
```

Related Commands

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP:AUTO (on page 2187)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

SENSe:FVTIME:MEASview1:FREQUENCY:STEP 1.5kHz sets the step size to 1.5 kHz.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP:AUTO?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 specifies that the frequency step size is set manually using the [SENSe]:FVTime[:MEASview<y>]:FREQuency:STEP command.

ON or 1 specifies that the frequency step size is set automatically.

Examples

SENSe:FVTIME:MEASview1:BANDWIDTH:AUTO ON sets the frequency step size automatically.

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STOP

Sets or queries the measurement stop frequency (right edge of the graph) in the Frequency versus Time measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:FVTime[:MEASview<y>]:FREQuency:CENTer command.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STOP <value>
[SENSe]:FVTime[:MEASview<y>]:FREQuency:STOP?
```

Related Commands

[SENSe]:FVTime[:MEASview<y>]:FREQuency:STARt (on page 2186)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the measurement stop frequency.

Range: (center frequency) ± (span)/2.

Examples

SENSe:FVTIME:MEASview1:FREQUENCY:STOP 7.05GHz sets the stop frequency to 7.05 GHz.

[SENSe]:FVTime[:MEASview<y>]:MAXTracepoints

Sets or queries the maximum trace points in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Sense commands

Syntax

```
[SENSe]:FVTime[:MEASview<y>]:MAXTracepoints { ONEK | TENK | HUNDredk | NEVerdecimate }
[SENSe]:FVTime[:MEASview<y>]:MAXTracepoints?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

ONEK sets the maximum trace points to 1 k.

TENK sets the maximum trace points to 10 k.

HUNDredk sets the maximum trace points to 100 k.

NEVerdecimate never decimates the trace points.

Examples

SENSe:FVTIME:MEASview1:MAXTRACEPOINTS TENK sets the maximum trace points to 10 k.

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor

Sets or queries the ogram color scheme.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}`

`[SENSe]:AVTime[:MEASview<y>]:OGRAm:COLor?`

Related Commands

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MAXimum (on page 2189)

Arguments

The following table lists the arguments.

Argument	Description
`RED`	Red
`GREen`	Green
`BLUe`	Blue
`CYAN`	Cyan
`BCYan`	Binary cyan
`YELLow`	Yellow
`MAGenta`	Magenta
`GRAY`	Gray
`TEMPerature`	Temperature
`SPECtral`	Spectral

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

`{RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}`

Examples

`SENSe:FVTime:MEASview1:OGRAm:COLor TEMPerature` selects the temperature color palette.

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MAXimum

Sets or queries the maximum value of the color axis in the ogram.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MAXimum <value>`

`[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MAXimum?`

Related Commands

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MINimum (on page 2190)

Arguments

`<value>::=<NRf>` specifies the maximum value of the color axis.

Range: -100 to +100 dBm.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`<NRf>` specifies the maximum value of the color axis.

Examples

`SENSe:FVTime:MEASview1:OGRAm:COLor:MAXimum 10` sets the maximum value of the color axis to 10 dBm.

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MINimum

Sets or queries the minimum value of the color axis in the ogram.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MINimum <value>`

`[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MINimum?`

Related Commands

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:MAXimum (on page 2189)

Arguments

`<value>::=<NRf>` specifies the minimum value of the color axis.

Range: -100 to +100 dBm.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

<NRf> specifies the minimum value of the color axis.

Examples

SENSe:FVTime:MEASview1:OGRAm:COLor:MINimum 10 sets the minimum value of the color axis to 10 dBm.

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:REVerse

Sets or queries reverse color scheme state.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:REVerse { OFF | ON | 0 | 1 }

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor:REVerse?

Related Commands

[SENSe]:FVTime[:MEASview<y>]:OGRAm:COLor (on page 2188)

Arguments

OFF or 0 disables Reverse color scheme.

ON or 1 enables Reverse color scheme.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

0 disables Reverse color scheme.

1 enables Reverse color scheme.

Examples

SENSe:FVTime:MEASview1:OGRAm:COLor:REVerse OFF disables reverse color scheme.

[SENSe]:FVTime[:MEASview<y>]:PLOT

Sets or queries the Frequency vs time display mode.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:FVTime[:MEASview<y>]:PLOT {TRACE | OGRAM |SPLIT}

```
[SENSe]: FVTime [:MEASview<y>]:PLOT?
```

Arguments

`TRACE` displays time plot .

`OGRAM` displays Ogram plot.

`SPLIT` displays both ogram and time plots.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

```
{TRACE | OGRAM | SPLIT}
```

Examples

`SENSe:FVTime:MEASview1:PLOT TRACE` sets plot type to TRACE (Time plot).

[SENSe]:FVTime[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source with respect to the Frequency versus Time Measurement View nuumber

Conditions

Measurement views: Frequency versus Time with specified Measurement view number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
SENSe:FVTime[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
SENSe:FVTime[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

`SENSe:FVTime:MEASview1:SELEcted:SOURce?` queries or sets the Source for Frequency versus Time Measurement View 1.

[SENSe]:IQVTime[:MEASview<y>]:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

[SENSe]:IQVTime[:MEASview<y>]:CLEar:RESults

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

SENSe:IQVTIME:MEASview1:CLEAR:RESULTS restarts multi-trace functions.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:CENTer

Sets or queries the center frequency in the RF I&Q versus Time measurement.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:CENTer <value>
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:CENTer?
```

Related Commands

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STARt (on page 2194)

[SENSe]:IQVTime:MEASview<y>:FREQuency:STOP (on page 2196)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

SENSe:IQVTIME:MEASview1:FREQUENCY:CENTER 7.5GHz sets the center frequency to 7.5 GHz.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:SPAN

Sets or queries the frequency span in the RF I&Q versus Time measurement.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:SPAN <value>
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:SPAN?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the frequency span.

Range: 10 Hz to 40 MHz (Standard) / 110 MHz (Option 110)

Examples

SENSe:IQVTIME:MEASview1:FREQUENCY:SPAN 20MHz sets the span to 20 MHz.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:SPAN:LINK

Sets or queries if frequency span is linked or not in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:SPAN:LINK <value>
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:SPAN:LINK?
```

Arguments

OFF or 0 specifies that Link to Span is not checked.

ON or 1 specifies that Link to Span is checked .

Examples

SENSe:IQVTime:MEASview1:FREQuency:SPAN:LINK? might return 0 or 1 based on condition of Link to Span checkbox.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STARt

Sets or queries the measurement start frequency (left edge on the graph) in the RF I&Q versus Time measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:IQVTime[:MEASview<y>]:FREQuency:CENTer command.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STARt <value>
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STARt?
```

Related Commands

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STOP (on page 2196)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the measurement start frequency.

Range: (center frequency) ± (span)/2.

Examples

SENSe:IQVTIME:MEASview1:FREQUENCY:START 6.95GHz sets the start frequency to 6.95 GHz.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP

Sets or queries the frequency step size (the amount per press by which the up or down key changes the setting value). Programming a specified step size sets [SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP:AUTO OFF.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP <value>
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP?
```

Related Commands

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP:AUTO (on page 2196)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

SENSe:IQVTIME:MEASview1:FREQUENCY:STEP 1.5kHz sets the step size to 1.5 kHz.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP:AUTO?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 specifies that the frequency step size is set manually using the [SENSe]:IQVTime[:MEASview<y>]:FREQuency:STEP command.

ON or 1 specifies that the frequency step size is set automatically.

Examples

SENSe:IQVTIME:MEASview1:FREQUENCY:STEP:AUTO ON sets the frequency step size automatically.

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STOP

Sets or queries the measurement stop frequency (right edge of the graph) in the RF I&Q versus Time measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:IQVTime[:MEASview<y>]:FREQuency:CENTer command.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STOP <value>
[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STOP?
```

Related Commands

[SENSe]:IQVTime[:MEASview<y>]:FREQuency:STARt (on page 2194)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the measurement stop frequency.

Range: (center frequency) ± (span)/2.

Examples

SENSe:IQVTIME:MEASview1:FREQUENCY:STOP 7.05GHz sets the stop frequency to 7.05 GHz.

[SENSe]:IQVTime[:MEASview<y>]:MAXTracepoints

Sets or queries the maximum trace points in the RF I&Q versus Time measurement.

Conditions

Measurement views: RF I&Q versus Time

Group

Sense commands

Syntax

```
[SENSe]:IQVTime[:MEASview<y>]:MAXTracepoints { ONEK | TENK | HUNDredk | NEVerdecimate }
[SENSe]:IQVTime[:MEASview<y>]:MAXTracepoints?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

ONEK sets the maximum trace points to 1 k.

TENK sets the maximum trace points to 10 k.

HUNDredk sets the maximum trace points to 100 k.

NEVerdecimate never decimates the trace points.

Examples

SENSe:IQVTIME:MEASview1:MAXTRACEPOINTS TENK sets the maximum trace points to 10 k.

[SENSe]:IQVTime[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source with respect to the RF I&Q versus Time Measurement View nuumber

Conditions

Measurement views: RF I&Q versus Time

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
SENSe:IQVTime[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
SENSe:IQVTime[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

SENSe:IQVTime:MEASview1:SELEcted:SOURce? queries or sets the Source for RF I&Q versus Time.

SENSe:LTE:ACLR:BANDwidth:RESolution

Sets or queries the resolution bandwidth (RBW) in the LTE ACLR display.

Conditions

Measurement views: LTE ACLR

Group

Sense commands

Syntax

`SENSe:LTE:ACLR:BANDwidth:RESolution`

Arguments

`<value>::<NRf>` specifies the resolution bandwidth

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:BANDWIDTH:RESOLUTION?` might return `100.0000000E+3`, indicating the RBW is 100 kHz.

SENSe:LTE:ACLR:BANDwidth:VIDeo

Sets or queries the video bandwidth (VBW) in the LTE ACLR display.

Conditions

Measurement views: LTE ACLR

Group

Sense commands

Syntax

`SENSe:LTE:ACLR:BANDwidth:VIDeo <value>`

Arguments

`<value>::<NRf>` specifies the video bandwidth

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:BANDWIDTH:VIDEO 2.0000000E+3` sets the VBW to 2 kHz.

SENSe:LTE:ACLR:BANDwidth:VIDeo:STATe

Sets or queries enabling or disabling the video bandwidth (VBW) in the LTE ACLR display.

Conditions

Measurement views: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:BANDwidth:VIDeo:STATe { 0 | 1 }
SENSe:LTE:ACLR:BANDwidth:VIDeo:STATe?
```

Arguments

`0` disables the VBW.

`1` enables the VBW.

Returns

0 means that the VBW is disabled.

1 means that the VBW is enabled.

Examples

`SENSe:LTE:ACLR:BANDWIDTH:VIDEO:STATE 1` sets the VBW to automatic (enabled) and is decided by the analysis module.

SENSe:LTE:ACLR:CHANnel:IBANdwidth

Sets or queries the reference channel integration bandwidth for the LTE ACLR display.

Conditions

Measurement views: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:CHANnel:IBANdwidth <value>
SENSe:LTE:ACLR:CHANnel:IBANdwidth?
```

Arguments

`<value>::<NRf>` specifies the channel integration bandwidth.

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:CHANNEL:IBANDWIDTH?` might return `18.000000E+6`, indicating that the integration bandwidth is 18 MHz.

SENSe:LTE:ACLR:CHANnel:WIDTh

Sets or queries the reference channel width for the LTE ACLR display.

Conditions

Measurement views: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:CHANnel:WIDTh <value>
SENSe:LTE:ACLR:CHANnel:WIDTh?
```

Arguments

`<value>::<NRf>` specifies the reference channel width.

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:CHANNEL:WIDTH 5.00000000E+6` sets the reference channel width to 5 MHz.

SENSe:LTE:ACLR:CLEar:RESults (No Query Form)

Clears the results in the LTE ACLR measurement.

Conditions

Measurement views: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:CLEar:RESults
```

Arguments

None

Examples

`SENSe:LTE:ACLR:CLEAR:RESULTS` clears the results of the LTE ACLR measurement.

SENSe:LTE:ACLR:FREQuency

Sets or queries the measurement center frequency in the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:FREQuency <value>
SENSe:LTE:ACLR:FREQuency?
```

Arguments

`<value>::<NRf>` specifies the center frequency

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:FREQUENCY 1.000000000E+9` sets the center frequency to 1.0 GHz.

SENSe:LTE:ACLR:MFILter

Sets or queries the shape of the filter for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:MFILter { GAUSsian | RECTangular }
SENSe:LTE:ACLR:MFILter?
```

Arguments

`GAUSsian`: sets the filter shape to Gaussian.

`RECTangular`: sets the filter shape to rectangular.

Returns

`GAUSSIAN`: means the filter shape is Gaussian.

`RECTangular`: means the filter shape is rectangular.

Examples

`SENSe:LTE:ACLR:MFILTER RECT` sets the filter shape to rectangular.

SENSe:LTE:ACLR:MODE:REALtime

Sets or queries the real-time LTE ACLR measurement mode. When set to real-time, the reference channel and all requested adjacent channel regions are acquired together. When real-time if off, the measurement is done in Swept mode (an acquisition for each adjacent band).

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:MODE:REALtime { OFF | ON | 0 | 1 }
SENSe:LTE:ACLR:MODE:REALtime?
```

Arguments

`OFF` or `0` turns off the automatic update.

`ON` or `1` turns on automatic updates center frequency.

Returns

OFF or 0 means automatic update is off.

ON or 1 means automatic updates are off.

Examples

`SENSe:LTE:ACLR:MODE:REALTIME?` might return `1` to indicate the real-time checkbox in the LTE ACLR control panel is enabled.

SENSe:LTE:ACLR:NFLoor:ACQuire (No Query Form)

Enables measurement of the noise floor for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

`SENSe:LTE:ACLR:NFLoor:ACQuire`

Arguments

None

Examples

`SENSe:LTE:ACLR:NFLOOR:ACQUIRE` will enable measurement of the noise floor in the LTE ACLR measurement.

SENSe:LTE:ACLR:NFLoor:CORRected? (Query Only)

Returns whether or not noise correction was applied on the last acquisition in the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

`SENSe:LTE:ACLR:NFLoor:CORRected?`

Returns

1 means that noise correction was applied on the last acquisition.

0 means that noise correction was not applied on the last acquisition.

Examples

SENSe:LTE:ACLR:NFLOOR:CORRECTED? might return 1, indicating that noise correction was applied on the last acquisition.

SENSe:LTE:ACLR:NFLoor:STATe

Determines whether to enable or disable the correction for noise floor for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:NFLoor:STATe { OFF | ON | 0 | 1 }
SENSe:LTE:ACLR:NFLoor:STATe?
```

Arguments

OFF or 0 disables noise correction in the measurement view.

ON or 1 enables noise correction in the measurement view.

Returns

OFF or 0 means that noise correction is disabled in the measurement view.

ON or 1 means that noise correction is enabled in the measurement view.

Examples

SENSe:LTE:ACLR:NFLOOR:STATE OFF disables noise correction in the measurement view.

SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution

Sets or queries the resolution bandwidth (RBW) value in the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution <value>
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution?
```

Arguments

<value>::<NRf> specifies the RBW in the specified row.

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:OFFSET4:BANDWIDTH:RESOLUTION 30.000000000E+3` sets the RBW to 30 kHz for row 4.

SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:COUNt

Sets or queries the count for the resolution bandwidths in the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:COUNt <value>
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:COUNt?
```

Arguments

`<value>::<NR1>` specifies a count integer

Returns

<NR1>

Examples

`SENSe:LTE:ACLR:OFFSET1:BANDWIDTH:RESOLUTION:COUNT 10` sets the count for row 1 to 10.

SENSe:LTE:ACLR:OFFSet<X>:BANDwidth:RESolution:FILTer

Sets or queries the filter bandwidth resolution under Offset & Limit table tab for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Parameter <x> represents the row in the Offsets & Limits table

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<X>:BANDwidth:RESolution:FILTer <value>
SENSe:LTE:ACLR:OFFSet<X>:BANDwidth:RESolution:FILTer?
```

Arguments

`<value>::<NRf>` specifies the filter bandwidth resolution in the Offset & Limit table.

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:OFFSET1:BANDWIDTH:RESOLUTION:FILTER?` might return `100.0000000000E+3` indicating the value of filter bandwidth of the first row is 100 kHz.

SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:VIDeo

Sets or queries the resolution video bandwidth (VBW) value in the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:VIDeo <value>
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:VIDeo?
```

Arguments

`<value>::<NRf>` specifies the VBW in the specifies row.

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:OFFSET1:BANDWIDTH:RESOLUTION:VIDEO 40.000000000E+3` sets the resolution VBW to 40 kHz for row 1.

SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:VIDeo:STATe

Sets or queries whether to enable or disable the video resolution bandwidth (VBW) in the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:VIDeo:STATe{ 0 | 1 }
SENSe:LTE:ACLR:OFFSet<x>:BANDwidth:RESolution:VIDeo:STATe?
```

Arguments

`0` disables the VBW.

`1` enables the VBW.

Returns

0 means the resolution VBW is disabled in the specified row.

1 means the VBW is enabled in the specified row.

Examples

`SENSe:LTE:ACLR:OFFSET1:BANDWIDTH:RESOLUTION:VIDEO:STATE 1` enables the resolution VBW for row 1.

SENSe:LTE:ACLR:OFFSet<x>:DETection

Sets or queries the detection settings for all offsets for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:DETection { AVERage | PEAK }
SENSe:LTE:ACLR:OFFSet<x>:DETection?
```

Arguments

`AVERage`: Sets the offsets setting Average (VRMS)

`PEAK`: Sets the offsets setting is the positive peak

Returns

AVERage means the offsets setting Average (VRMS)

PEAK means the offsets setting is the positive peak

Examples

`SENSe:LTE:ACLR:OFFSET<x>:DETECTION AVER` sets the detection settings for all offsets to Average RMS.

SENSe:LTE:ACLR:OFFSet<x>:FREQuency:BANDwidth

Sets or queries the frequency bandwidth value for the specified row of the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:FREQuency:BANDwidth <value>
SENSe:LTE:ACLR:OFFSet<x>:FREQuency:BANDwidth?
```

Arguments

`<value>::<NRf>` specifies the frequency bandwidth value

Returns

<NR3>

Examples

`SENSE:LTE:ACLR:OFFSET1:FREQUENCY:BANDWIDTH?` might return `4.5150000000E+6`, indicating frequency bandwidth value of row 1 in the Offset & Limits table.

SENSe:LTE:ACLR:OFFSet<x>:FREQuency:OFFSet

Sets or queries the frequency offset value of the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:FREQuency:OFFSet <value>
SENSe:LTE:ACLR:OFFSet<x>:FREQuency:OFFSet?
```

Arguments

`<value>::<NRf>` specifies the frequency offset value

Returns

<NR3>

Examples

`SENSe:LTE:ACLR:OFFSET1:FREQUENCY:OFFSET?` might return `5.0000000000E+6`, indicating frequency offset value of row 1 in the Offset & Limits table tab.

SENSe:LTE:ACLR:OFFSet<x>:LIMit:ABSolute

Sets or queries the absolute limit value of the row in the Offset & Limit table tab for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:LIMit:ABSolute <value>
SENSe:LTE:ACLR:OFFSet<x>:LIMit:ABSolute?
```

Arguments

`<value>::<NRf>` specifies the absolute limit value of the specified row in the Offset & Limit table.

Returns

<NRf>

Examples

`SENSe:LTE:ACLR:OFFSET1:LIMIT:ABSOLUTE?` might return `-6.4500000000`, indicating the absolute limit value of row 1 is –6.4500000000 dBm.

SENSe:LTE:ACLR:OFFSet<x>:LIMit:MASK

Sets or queries the limit mask setting for the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Parameter <x> represents the row in the Offsets & Limits table

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:LIMit:MASK { ABS | REL | AND | OR }
SENSe:LTE:ACLR:OFFSet<x>:LIMit:MASK?
```

Arguments

`ABS` specifies the limit mask is set to Absolute.

`REL` specifies the limit mask is set to Relative

`AND` specifies the limit mask is set to Absolute AND Relative.

`OR` specifies the limit mask is set to Absolute OR Relative.

Returns

ABS means that the limit mask is set to Absolute.

REL means that the limit mask is set to Relative

AND means that the limit mask is set to Absolute AND Relative.

OR means that the limit mask is set to Absolute OR Relative.

Examples

`SENSe:LTE:ACLR:OFFSET3:LIMIT:MASK REL` sets the limit mask for row 3 to Relative.

SENSe:LTE:ACLR:OFFSet<x>:LIMit:RELative

Sets or queries the relative limit value of channel under Offset & Limit table tab for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Parameter <x> represents the row in the Offsets & Limits table

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:LIMit:RELative <value>
SENSe:LTE:ACLR:OFFSet<x>:LIMit:RELative?
```

Arguments

`<value>::<NRf>` specifies the relative limit value of the specified row in the Offset & Limit table.

Returns

`<NRf>`

Examples

`SENSe:LTE:ACLR:OFFSET1:LIMIT:RELATIVE?` might return `-44.2000000000`, indicating the relative limit value of row 1 is -44.2000000000 dB.

SENSe:LTE:ACLR:OFFSet<x>:LIMit:SIDE

Sets or queries the side of the offset limit for the specified row in the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Parameter <x> represents the row in the Offsets & Limits table

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:LIMit:SIDE { LEFT | RIGHt | BOTH }
SENSe:LTE:ACLR:OFFSet<x>:LIMit:SIDE?
```

Arguments

`LEFT` specifies the left offset limit.

`RIGHt` specifies the right offset limit.

`BOTH` specifies both sides of the offset limit.

Returns

LEFT means the left side offset limit is used for the specified row. RIGHt means the right side offset limit is used for the specified row. BOTH means both sides of the offset limit are used for the specified row.

Examples

`SENSe:LTE:ACLR:OFFSET1:LIMIT:SIDE BOTH` specifies the measurement uses both sides of the offset in row 1.

SENSe:LTE:ACLR:OFFSet<x>:STATe

Sets or queries the specified row of the Offsets & Limits table for the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

The parameter <x> represents the row in the Offsets & Limits table.

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:OFFSet<x>:STATe { OFF | ON | 0 | 1 }
SENSe:LTE:ACLR:OFFSet<x>:STATe?
```

Arguments

`OFF` or 0 turns off display of the row in the measurement view. ON or 1 turns on display of the row in the measurement view.

Returns

OFF or 0 means the display of the row in the measurement view is off. ON or 1 means the display of the row in the measurement view is on.

Examples

`SENSe:LTE:ACLR:OFFSET2:STATE OFF` means that the display of row 2 in the Offsets & Limits table.

SENSe:LTE:ACLR:POINts:COUNt

Sets or queries the number of points used for the trace in the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:POINts:COUNt <value>
SENSe:LTE:ACLR:POINts:COUNt?
```

Arguments

`<value>::<NRf>` specifies the number of points used for the trace

Returns

`<NR1>`

Examples

`SENSe:LTE:ACLR:POINTS:COUNT?` might return `P8001`, indicating a maximum of 8001 trace points can be used.

SENSe:LTE:ACLR:REFerence:MAGNitude

Sets or queries the reference power magnitude for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:REFerence:MAGNitude <value>
SENSe:LTE:ACLR:REFerence:MAGNitude?
```

Arguments

`<value>::<NRf>` specifies the reference power magnitude

Returns

`<NRf>`

Examples

`SENSe:LTE:ACLR:REFERENCE:MAGNITUDE?` might return a `-51.057`, indicating that the reference power magnitude is −51.057 dBm.

SENSe:LTE:ACLR:REFerence:MAGNitude:AUTO

Sets or queries the reference magnitude to automatic or manual for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:REFerence:MAGNitude:AUTO { 0 | 1 }
SENSe:LTE:ACLR:REFerence:MAGNitude:AUTO?
```

Arguments

`0` sets reference magnitude to Manual.

`1` sets reference magnitude to Automatic.

Returns

0 means the reference magnitude is set to Manual.

1 means the reference magnitude is set to Automatic.

Examples

`SENSe:LTE:ACLR:REFERENCE:MAGNITUDE:AUTO 0` sets the reference magnitude to Manual.

SENSe:LTE:ACLR:REFerence:MAGNitude:DETection

Sets or queries the reference magnitude detection for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:REFerence:MAGNitude:DETection { AVERage | PEAK }
SENSe:LTE:ACLR:REFerence:MAGNitude:DETection?
```

Arguments

`AVER` sets reference magnitude detection to Avg(VRMS) PEAK sets reference magnitude detection to +Peak.

Returns

AVER means the reference magnitude detection is set to Avg(VRMS) PEAK means the reference magnitude detection is set to +Peak.

Examples

`SENSe:LTE:ACLR:REFERENCE:MAGNITUDE:DETECTION AVER` sets the magnitude detection to Avg(RMS).

SENSe:LTE:ACLR:STEP:AUTO

Determines whether to automatically update the center frequency increment/decrement step size in the LTE ACLR display. The step value controls the magnitude of each step when using the front panel controls or arrow key on the keyboard.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:STEP:AUTO { OFF | ON | 0 | 1 }
SENSe:LTE:ACLR:STEP:AUTO?
```

Arguments

`OFF` or `0` turns off the automatic update.

`ON` or `1` turns on automatic updates center frequency.

Returns

OFF or 0 means automatic update is off. ON or 1 means automatic updates are off.

Examples

`SENSe:LTE:ACLR:STEP:AUTO ON` automatically updates the center frequency.

SENSe:LTE:ACLR:STEP:MAGNitude

Sets or queries the step magnitude for the center frequency in the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Sense commands

Syntax

```
SENSe:LTE:ACLR:STEP:MAGNitude <value>
```

```
SENSe:LTE:ACLR:STEP:MAGNitude?
```

Arguments

`<value>::<NRf>` specifies the center frequency

Returns

`<NR3>`

Examples

`SENSe:LTE:ACLR:STEP:MAGNITUDE 4.000000000E+6` sets the step magnitude to 4 MHz.

SENSe:LTE:ANALysis:AVErage:OVER:OFFSlot:STATe

Determines whether to enable or disable Auto check box of Average over offslot in the Prefs tab of LTE Power vs Time display control panel.

Conditions

Measurement view: LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe:LTE:ANALysis:AVErage:OVER:OFFSlot:STATe {0 | OFF | 1 | ON}
SENSe:LTE:ANALysis:AVErage:OVER:OFFSlot:STATe?
```

Arguments

`0` or `OFF` disables the Average over offslot check box

`1` or `ON` enables the Average over offslot check box

Returns

`<Boolean> 0, 1`

Examples

`SENSe:LTE:ANALYSIS:AVERAGE:OVER:OFFSLOT:STATE OFF` disables the Average over offslot check box.

SENSe]:LTE:ANALysis:EQUAlization:STATe

Sets or queries the Enable Equalization state in the Analysis Params tab of the LTE Settings control panel.

Conditions

Measurement view: LTE Constellation, LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe]:LTE:ANALysis:EQUAlization:STATe { 0 | 1 }
SENSe]:LTE:ANALysis:EQUAlization:STATe?
```

Arguments

`0` disables the Enable Equalization.

`1` enables the Enable Equalization.

Returns

0 means that Enable Equalization is disabled. 1 means that Enable Equalization is enabled.

Examples

`SENSe:LTE:ANALYSIS:EQUALIZATION:STATE?` might return `0`, indicating that Enable Equalization is disabled.

SENSe:LTE:ANALysis:LENGth

Sets or queries the Analysis length value in the Analysis Time tab of the LTE Power vs Time display and LTE Constellation display control panels.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:ANALysis:LENGth <Value>
SENSe:LTE:ANALysis:LENGth?
```

Arguments

`<Value>=<NR2>`

Returns

`<NR2>`

Examples

`SENSe:LTE:ANALYSIS:LENGTH?` might return `34.2`, indicating the analysis length is 34.2.

SENSe:LTE:ANALysis:LENGth:ACTual? (Query Only)

Queries the actual analysis length for the LTE Constellation and LTE Power vs Time displays. A query returns a value in either seconds or symbols.

Conditions

Measurement view: LTE Constellation, LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe:LTE:ANALysis:LENGth:ACTual?
```

Returns

<NRf>

Examples

SENSe:LTE:ANALYSIS:LENGTH:ACTUAL? might return 43, indicating that the actual analysis length is 43 symbols.

SENSe:LTE:ANALysis:LENGth:AUTO

Determines whether to enable or disable the Auto check box for Analysis Length in the Analysis Time tab of the LTE Power vs Time display and LTE Constellation display control panels.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:ANALysis:LENGth:AUTO {0 | OFF |1 | ON}
SENSe:LTE:ANALysis:LENGth:AUTO?
```

Arguments

0 or OFF disables the Auto checkbox of analysis length

1 or ON enables the Auto checkbox of analysis length

Returns

<Boolean> 0, 1

Examples

SENSe:LTE:ANALYSIS:LENGTH:AUTO ON enables the Analysis Length Auto check box.

[SENSe]:LTE:ANALysis:OFFSet

Sets or queries the LTE analysis offset for the LTE Constellation or LTE Power vs Time measurements. The query command returns the result in symbols or seconds, depending on the unit choice selected in the Analysis Time tab of the LTE Settings control panel.

Conditions

Measurement view: LTE Constellation, LTE Power vs Time

Group

Sense commands

Syntax

```
[SENSe]:LTE:ANALysis:OFFSet <value>
```

Arguments

<value> specifies the analysis offset in the Analysis Time tab of the LTE Settings control panel.

Returns

<NRf> Units are determined from the units choice selected in the Analysis Time tab of the LTE Settings control panel.

Examples

`SENSe:LTE:ANALYSIS:OFFSET -50` sets the analysis offset to –50 symbols.

SENSe:LTE:ANALysis:OFFSet:AUTO

Sets or queries the Auto checkbox state for analysis offset. This setting determines if the analysis offset for the LTE Constellation and LTE Power vs Time displays is set automatically or manually.

Conditions

Measurement view: LTE Constellation, LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe:LTE:ANALysis:OFFSet:AUTO { 0 | 1 }
```

Arguments

`0` sets the analysis offset to manual (box is unchecked)

`1` sets the analysis offset to automatic (checkbox is checked)

Returns

0 means the analysis offset is set to manual (box is unchecked)

1 means the analysis offset is set to automatic (checkbox is checked)

Examples

`SENSe:LTE:ANALYSIS:OFFSET:AUTO 1` sets the analysis offset to automatic.

SENSe:LTE:ANALysis:TIMe:UNIT

Sets or queries the unit preference under the Analysis tab of the LTE Settings control panel for the LTE Constellation and LTE Power vs Time displays.

Conditions

Measurement view: LTE Constellation, LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe:LTE:ANALysis:TIMe:UNIT { SEC | SYMB }
SENSe:LTE:ANALysis:TIMe:UNIT?
```

Arguments

`SEC` sets the units to seconds.

`SYMB` sets the units to symbols.

Returns

SEC means the units are set to seconds.

SYMB means the units are set to symbols.

Examples

`SENSe:LTE:ANALYSIS:TIME:UNIT SEC` sets the units to seconds.

SENSe:LTE:ANTEnna:PORTs:CHOSen

Sets or queries the chosen port in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panels.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:ANTEnna:PORTs:CHOSen {ZERO|ONE|TWO|THREE}
SENSe:LTE:ANTEnna:PORTs:CHOSen?
```

Arguments

`{ZERO|ONE|TWO|THREE}`

Returns

`<String> (ZERO to THREE)`

Examples

`SENSe:LTE:ANTENNA:PORTS:CHOSEN ONE` sets the chosen port to port 1.

SENSe:LTE:ANTEnna:PORTs:TOTal

Sets or queries the total number of Antenna ports in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panels.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:ANTEnna:PORTs:TOTal {ONE|TWO|FOUR}
SENSe:LTE:ANTEnna:PORTs:TOTal?
```

Arguments

`{ONE|TWO|FOUR}`

Returns

`<String> ONE , TWO or FOUR`

Examples

`SENSe:LTE:ANTENNA:PORTS:TOTAL FOUR` sets the total number of Antenna ports to 4.

SENSe:LTE:AUTO:DETect

Determines whether to enable or disable the Auto check box in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panel to automatically detect.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:AUTO:DETect {0 | OFF | 1 | ON}
SENSe:LTE:AUTO:DETect?
```

Arguments

`ON` or `1` to enables the Auto check box

`OFF` or `0` to disables the Auto check box

Returns

`<Boolean> 0, 1`

Examples

`SENSe:LTE:AUTO:DETECT 1` enables the Auto detect check box.

SENSe:LTE:CHANnel:(BANDwidth|BWIDth)

Sets or queries Channel Bandwidth value in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panels.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:CHANnel:(BANDwidth|BWIDth) {BW1PT4M|BW3M| BW5M| BW10M| BW15M| BW20M}
SENSe:LTE:CHANnel:(BANDwidth|BWIDth)?
```

Arguments

`BW1PT4M` sets the value to 1.4MHz

`BW3M` sets the value to 3 MHz

`BW5M` sets the value to 5 MHz

`BW10M` sets the value to 10 MHz

`BW15M` sets the value to 15 MHz

`BW20M` sets the value to 20 MHz

Returns

<String> See Arguments

Examples

SENSe:LTE:CHANNEL:(BANDWIDTH|BWIDTH) BW15M sets the Channel Bandwidth to 15 MHz.

SENSe:LTE:CHANnel:BANDwidth

Specifies or queries the channel bandwidth to use for the LTE Constellation or LTE Power vs Time measurements.

Conditions

Measurement view: LTE Constellation, LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe:LTE:CHANnel:BANDwidth { BW5M | BW10M | BW15M | BW20M }
```

Arguments

BW5M, BW10M, BW15M, BW20M each specifies a channel bandwidth to use for the measurement.

Returns

Query returns one of the argument values, indicating the selected channel bandwidth.

Examples

SENSe:LTE:CHANNEL:BANDWIDTH BW5M sets the channel bandwidth to use to 5 MHz.

SENSe:LTE:CHSPectrum:AVERage

Sets or queries how to average waveform in the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:AVERage { OFF | TIME | FREQ }
SENSe:LTE:CHSPectrum:AVERage?
```

Arguments

OFF disables averaging.

TIME averages the waveform using time samples.

FREQuency averages the waveform using frequency samples.

Returns

OFF means averaging is disabled.

TIME means averaging of the waveform is performed using time samples.

FREQuency means averaging of the waveform is performed using frequency samples.

Examples

SENSe:LTE:CHSPECTRUM:AVERAGE TIME sets the analyzer to average the waveform using time samples.

SENSe:LTE:CHSPectrum:AVERage:COUNt

Sets or queries the number of traces for averaging in the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:AVERage:COUNt <number>
SENSe:LTE:CHSPectrum:AVERage:COUNt?
```

Arguments

<number>::<NR1> specifies the average count

Returns

<NR1>

Examples

SENSe:LTE:CHSPECTRUM:AVERAGE:COUNT? might return 10, indicating that 10 is the number of traces for averaging.

SENSe:LTE:CHSPectrum:BANDwidth:RESolution

Sets or queries the resolution bandwidth (RBW) in the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:BANDwidth:RESolution
```

Arguments

<value>::<NRf> specifies the resolution bandwidth

Returns

<NR3>

Examples

SENSe:LTE:CHSPECTRUM:BANDWIDTH:RESOLUTION? might return 30.0000000E+3, indicating the RBW is 30 kHz.

SENSe:LTE:CHSPectrum:BANDwidth:RESOlution:AUTO

Determines whether to set the resolution bandwidth (RBW) in the LTE Channel Spectrum display automatically or manually.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:BANDwidth:RESOlution:AUTO { OFF | ON| 0 | 1 }
SENSe:LTE:CHSPectrum:BANDwidth:RESOlution:AUTO?
```

Arguments

OFF or 0 sets the RBW to manual.

ON or 1 sets the RBW to automatic.

Returns

OFF or 0 means that the RBW is set to manual.

ON or 1 means that the RBW is set to automatic.

Examples

SENSe:LTE:CHSPECTRUM:BANDWIDTH:RESOLUTION:AUTO 1 sets the RBW to automatic and is decided by the analysis module.

SENSe:LTE:CHSPectrum:BANDwidth:VIDeo

Sets or queries the video bandwidth (VBW) in the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:BANDwidth:VIDeo <value>
```

Arguments

<value>::<NRf> specifies the video bandwidth

Returns

<NR3>

Examples

SENSe:LTE:CHSPECTRUM:BANDWIDTH:VIDEO 3.0000000E+3 sets the VBW to 3 kHz.

SENSe:LTE:CHSPectrum:BANDwidth:VIDeo:STATe

Sets or queries enabling or disabling the video bandwidth (VBW) in the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:BANDwidth:VIDeo:STATe { 0 | 1 }
SENSe:LTE:CHSPectrum:BANDwidth:VIDeo:STATe?
```

Arguments

`0` disables the VBW.

`1` enables the VBW.

Returns

0 means that the VBW is disabled.

1 means that the VBW is enabled.

Examples

`SENSe:LTE:CHSPECTRUM:BANDWIDTH:VIDEO:STATE 1` sets the VBW to enabled.

SENSe:LTE:CHSPectrum:CHANnel:BANDwidth

Specifies or queries a nominal channel bandwidth to use for the LTE Channel Spectrum measurements.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:CHANnel:BANDwidth { BW5M | BW10M | BW20M | BW1PT4M | BW3M | BW15M }
```

Arguments

`BW5M`, `BW10M`, `BW20M`, `BW1PT4M`, `BW3M`, `BW15M` each specifies a nominal channel bandwidth to use for the measurement.

Returns

Query returns one of the argument values, indicating the selected nominal channel bandwidth.

Examples

`SENSe:LTE:CHSPECTRUM:CHANNEL:BANDWIDTH BW20M` sets the nominal channel bandwidth to use to 20 MHz.

SENSe:LTE:CHSPectrum:CLEar:RESults (No Query Form)

Clears the results in the LTE Channel Spectrum measurement.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:CLEar:RESults
```

Arguments

None

Examples

`SENSe:LTE:CHSPECTRUM:CLEAR:RESULTS` clears the results of the LTE Channel Spectrum measurement.

SENSe:LTE:CHSPectrum:DETection

Sets or queries the trace detection settings for the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:DETection { POS | AVER }
SENSe:LTE:CHSPectrum:DETection?
```

Arguments

`AVERage`: sets the detection setting to Average (VRMS) POS: sets the detection setting to the positive peak

Returns

`AVERage` means the detection setting is Average (VRMS) POS means the detection setting is positive peak

Examples

`SENSe:LTE:CHSPECTRUM:DETECTION POS` sets the trace detection settings to +Peak under the Prefs tab.

SENSe:LTE:CHSPectrum:FREQuency

Sets or queries the measurement center frequency in the LTE Channel Spectrum display.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:FREQuency <value>
```

SENSe:LTE:CHSPectrum:FREQuency?

Arguments

<value>::<NRf> specifies the center frequency

Returns

<NR3>

Examples

SENSe:LTE:CHSPECTRUM:FREQUENCY 1.000000000E+9 sets the center frequency to 1.0 GHz.

SENSe:LTE:CHSPectrum:FREQuency:SPAN

Sets or queries the frequency span in the LTE Channel Spectrum measurement.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

SENSe:LTE:CHSPectrum:FREQuency:SPAN <value>

SENSe:LTE:CHSPectrum:FREQuency:SPAN?

Arguments

<value>::<NRf> specifies the frequency span

Returns

<NRf>

Examples

SENSe:LTE:CHSPECTRUM:FREQUENCY:SPAN sets the frequency span in the LTE Channel Spectrum display.

SENSe:LTE:CHSPectrum:FREQuency:STEP

Sets or queries the frequency step size in the LTE Channel Spectrum measurement. Programming a specified step size sets SENSe:LTE:CHSPectrum:FREQuency:STEP:AUTO to OFF.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

SENSe:LTE:CHSPectrum:FREQuency:STEP <value>
SENSe:LTE:CHSPectrum:FREQuency:STEP?

Arguments

`<value>::<NRf>` specifies the frequency step size

Returns

`<NR3>`

Examples

`SENSe:LTE:CHSPECTRUM:FREQUENCY:STEP 200.000000000E+3` sets the frequency step size to 200 kHz.

SENSe:LTE:CHSPectrum:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually in the LTE Channel Spectrum measurement.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
SENSe:LTE:CHSPectrum:FREQuency:STEP:AUTO?
```

Arguments

`OFF` or `0` sets the frequency step size is set to manual.

`ON` or `1` sets the frequency step size is set to automatic.

Returns

OFF or 0 means that the frequency step size is set to manual. ON or 1 means that the frequency step size is set to automatic.

Examples

`SENSe:LTE:CHSPECTRUM:FREQUENCY:STEP:AUTO ON` specifies that the frequency step size is set automatically.

SENSe:LTE:CHSPectrum:POINts:COUNt

Sets or queries the number of points used for the trace in the LTE Channel Spectrum measurement.

Conditions

Measurement view: LTE Channel Spectrum

Group

Sense commands

Syntax

```
SENSe:LTE:CHSPectrum:POINts:COUNt <value>
SENSe:LTE:CHSPectrum:POINts:COUNt?
```

Arguments

`<value>::<NRf>` specifies the number of points used for the trace

Returns

P<NR1>

Examples

SENSe:LTE:CHSPECTRUM:POINTS:COUNT? might return P8001, indicating a maximum of 8001 trace points can be used.

SENSe:LTE:CYClic:PREFix

Sets or queries the cyclic prefix type in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panels.

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:CYClic:PREFix {NORM|EXT}
SENSe:LTE:CYClic:PREFix?
```

Arguments

NORM sets the cyclic prefix to Normal.

EXT sets the cyclic prefix to Extended.

Returns

<String> NORM or EXT

Examples

SENSe:LTE:CYCLIC:PREFIX NORM sets the cyclic prefix to Normal.

SENSe:LTE:FRAMe:STRUcture

Sets or queries the frame structure in the Modulation Params tab of the LTE settings control panel.

Conditions

Measurement view: LTE Constellation and LTE Power vs Time

Group

Sense commands

Syntax

```
SENSe:LTE:FRAMe:STRUcture { FDD | TDD }
SENSe:LTE:FRAMe:STRUcture?
```

Arguments

FDD

TDD

Returns

`FDD TDD`

Examples

`SENSe:LTE:FRAME:STRUCTURE FDD` sets the frame structure to FDD.

SENSe:LTE:LINK:CONFiguration

Sets or queries Uplink-Downlink value in TDD configuration in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panels.

This happens only when Downlink TDD is Selected as Frame Structure

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:LINK:CONFiguration {ZERO |ONE |TWO |THREE |FOUR|FIVE |SIX}
SENSe:LTE:LINK:CONFiguration?
```

Arguments

`{ZERO |ONE |TWO |THREE |FOUR |FIVE |SIX}`

Returns

`<String>` (Zero to Six)

Examples

`SENSe:LTE:LINK:CONFIGURATION ONE` sets the Uplink-Downlink value as 1 in TDD configuration.

SENSe:LTE:SUBFrame:CONFiguration

Sets or queries special subframe value in TDD configuration in the Modulation Params tab of the LTE Power vs Time display and LTE Constellation display control panels.

This happens only when Downlink TDD is selected as the Frame Structure

Conditions

Measurement view: LTE Power vs Time, LTE Constellation

Group

Sense commands

Syntax

```
SENSe:LTE:SUBFrame:CONFiguration {ZERO |ONE |TWO |THREE|FOUR |FIVE |SIX |SEVEN |EIGHT |NINE}
SENSe:LTE:SUBFrame:CONFiguration?
```

Arguments

`{ZERO |ONE |TWO |THREE |FOUR |FIVE |SIX |SEVEN |EIGHT |NINE}`

Returns

<String> (Zero to Nine)

Examples

SENSe:LTE:SUBFRAME:CONFIGURATION SIX sets the special subframe value to 6 in TDD configuration.

[SENSe]:MCPower:AVERage

Sets or queries the average method in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:AVERage { OFF | TIMe | FREQuency }
[SENSe]:MCPower:AVERage?
```

Arguments

OFF disables averaging.

TIMe performs averaging for time samples.

FREQuency performs averaging for frequency samples.

Examples

SENSe:MCPOWER:AVERAGE TIMe performs averaging for time samples.

[SENSe]:MCPower:AVERage:COUNt

Sets or queries the average count in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:AVERage:COUNt <value>
[SENSe]:MCPower:AVERage:COUNt?
```

Arguments

<value>::<NR1> specifies the average count. Range: 2 to 10000.

Examples

SENSe:MCPOWER:AVERAGE:COUNT 256 sets the average count to 256.

[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW). Programming a specified RBW sets `[SENSe]:MCPower{BANDwidth|BWIDth}[:RESolution]:AUTO OFF`.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]?
```

Related Commands

[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]:AUTO (on page 2230)

Arguments

`<value>::<NRf>` specifies the RBW. Range: 100 Hz to 5 MHz.

Examples

`SENSe:MCPOWER:BANDWIDTH:RESOLUTION 200kHz` sets the RBW to 200 kHz.

[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]:ACTual? (Query Only)

Queries the actual resolution bandwidth (RBW) in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]:ACTual?
```

Arguments

None

Returns

`<NRf>` The actual RBW in Hz.

Examples

`SENSe:MCPOWER:BANDWIDTH:RESOLUTION:ACTUAL?` might return `299.624E+3`, indicating that the actual RBW is 299.624 kHz.

[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]:AUTO { OFF | ON | 0 | 1 }
[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]:AUTO?
```

Arguments

`OFF` or `0` specifies that the resolution bandwidth is set manually using the `[SENSe]:MCPower:{BANDwidth|BWIDth}[:RESolution]` command.

`ON` or `1` specifies that the resolution bandwidth is set automatically.

Examples

`SENSe:MCPOWER:BANDWIDTH:AUTO ON` sets the resolution bandwidth automatically.

[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo

Sets or queries the video bandwidth (VBW). Programming a specified VBW sets `[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo:STATe OFF`.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo <value>
[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo?
```

Related Commands

[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo:STATe (on page 2230)

Arguments

`<value>::<NRf>` specifies the VBW.

Range: Current RBW/104 (1 Hz minimum) to Current RBW.

Examples

`SENSe:MCPOWER:BANDWIDTH:VIDEO 200kHz` sets the VBW to 200 kHz.

[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo:STATe

Determines whether to enable the video bandwidth (VBW) in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo:STATe { OFF | ON| 0 | 1 }
[SENSe]:MCPower:{BANDwidth|BWIDth}:VIDeo:STATe?
```

Arguments

`OFF` or `0` disables the VBW.

`ON` or `1` enables the VBW.

Examples

`SENSe:MCPOWER:BANDWIDTH:VIDEO:STATE ON` enables the VBW.

[SENSe]:MCPower:CHANnel:ADJacent:ADD (No Query Form)

Adds a pair of upper and lower adjacent channels in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:ADJacent:ADD <offset>,<bandwidth>
```

Arguments

`<offset>::<NRf>` specifies the offset from the center frequency for the adjacent channel.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

`<bandwidth>::<NRf>` specifies the bandwidth of the adjacent channel.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:MCPOWER:CHANNEL:ADJACENT:ADD 200kHz, 80kHz` adds a pair of upper and lower adjacent channels with the offset of ±200 kHz and the bandwidth of 80 kHz.

[SENSe]:MCPower:CHANnel:ADJacent:DELete (No Query Form)

Deletes a selected adjacent channel in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:ADJacent:DELete <channel>
```

Arguments

`<channel>::<string>` specifies the channel to be deleted.

Specify the channel with "A<n>" for the adjacent channel where <n> represents the channel number (<n> = 1, 2, 3,...). See the example below.

Examples

`SENSe:MCPower:CHANnel:ADJacent:DELete "A2"` deletes A2 (the adjacent channel 2).

[SENSe]:MCPower:CHANnel:ADJacent:LIMIts<x>

This command returns the selected adjacent upper and lower limit values. Selection of adjacent channel.

Conditions

Measurement view: P25 MCPR

The parameter <x>=1 to 100.

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:ADJacent:LIMIts<x>
[SENSe]:MCPower:CHANnel:ADJacent:LIMIts<x>?
```

Arguments

`<x>`=1 to 100

Returns

Upper and lower limit values for selected adjacent channels.

Examples

`SENSe:MCPower:CHANnel:ADJacent:LIMIts2?` returns upper and lower limit values of A2 (Adjacent channel 2).

[SENSe]:MCPower:CHANnel:ADJacent:LIMIts<x>:ENABle? (Query Only)

This query returns whether the adjacent channel is selected or not.

Conditions

Measurement view: P25 MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:ADJacent:LIMIts<x>:ENABle?
```

Returns

`0` means the adjacent channel is disabled.

`1` means the adjacent channel is enabled.

Examples

If `SENSe:MCPower:CHANnel:ADJacent:LIMIts1:ENABle?` returns `1`, A1 (adjacent channel 1) is enabled.

[SENSe]:MCPower:CHANnel:FILTer

Sets or queries the adjacent channel filter in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:FILTer { RRCosine | NONE }
[SENSe]:MCPower:CHANnel:FILTer?
```

Arguments

`RRCosine` selects the Root-Raised-Cosine filter.

`NONE` uses no filter.

Examples

`SENSe:MCPOWER:CHANNEL:FILTER RRCosine` selects Root-Raised-Cosine for the adjacent channel filter.

[SENSe]:MCPower:CHANnel:MAIN:{BANDwidth|BWIDth}

Sets or queries the frequency bandwidth of the main channels (all share the same value) in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:MAIN:{BANDwidth|BWIDth} <value>
[SENSe]:MCPower:CHANnel:MAIN:{BANDwidth|BWIDth}?
```

Arguments

`<value>::<NRf>` specifies the main channel bandwidth.

Range: 1 Hz to full span.

Examples

`SENSe:MCPOWER:CHANNEL:MAIN:BANDWIDTH 4.5MHz` sets the main channel bandwidth to 4.5 MHz.

[SENSe]:MCPower:CHANnel:MAIN:COUNt

Sets or queries the number of main channels in the MCPR measurement. You can use this command to add and remove main channels.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:MAIN:COUNt <value>
[SENSe]:MCPower:CHANnel:MAIN:COUNt?
```

Arguments

`<value>::<NRf>` specifies the number of main channels. Range: 1 to 99.

Examples

`SENSe:MCPOWER:CHANNEL:MAIN:COUNT 3` sets the the number of main channels to 3.

[SENSe]:MCPower:CHANnel:MAIN:INACtive

Makes a specified main channel inactive. You can set it on or off. The query returns all inactive main channels.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:MAIN:INACtive <channel>,<boolean>
[SENSe]:MCPower:CHANnel:MAIN:INACtive?
```

Arguments

`<channel>::<string>` specifies the channel to be inactive.

Specify the channel with "M<n>" for the main channel where <n> represents the channel number (<n> = 1, 2, 3,...). See the example below.

`<boolean>::={ OFF | ON | 0 | 1 }` specifies that the specified channel is inactive (On) or not (Off).

Examples

SENSe:MCPOWER:CHANNEL:MAIN:INACTIVE "M2",ON makes the main channel 2 inactive.

[SENSe]:MCPower:CHANnel:MAIN:SPACing

Sets or queries frequency difference between centers of each main channel in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHANnel:MAIN:SPACing <value>
[SENSe]:MCPower:CHANnel:MAIN:SPACing?
```

Arguments

<value>::<NRf> specifies the spacing between two adjacent main channels.

Range: 1 Hz to 1 GHz.

Examples

SENSe:MCPOWER:CHANNEL:MAIN:SPACING 5MHz sets the main channel spacing to 5 MHz.

[SENSe]:MCPower:CHIPrate

Sets or queries the chip rate in the MCPR measurement. This command is valid when [SENSe]:MCPower:CHANnel:FILTer is set to RRCosine (Root-Raised-Cosine).

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CHIPrate <value>
[SENSe]:MCPower:CHIPrate?
```

Arguments

<value>::<NRf> specifies the chip rate. Range: 100 Hz to 105 MHz.

Examples

SENSe:MCPOWER:CHIPRATE 1kHz sets the chip rate to 1 kHz.

[SENSe]:MCPower:CLEar:RESults (No Query Form)

Restarts the average trace.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:CLEar:RESults
```

Arguments

None

Examples

`SENSe:MCPOWER:CLEAR:RESULTS` restarts the average trace.

[SENSe]:MCPower:FREQuency

Sets or queries the center frequency in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:FREQuency <value>
[SENSe]:MCPower:FREQuency?
```

Arguments

`<value>::<NRf>` specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B– 1 to 26.5 GHz

Examples

`SENSe:MCPOWER:FREQUENCY 2.35GHz` sets the center frequency to 2.35 GHz.

[SENSe]:MCPower:FREQuency:STEP

Sets or queries the frequency step size. Programming a specified step size sets `[SENSe]:MCPower:FREQuency:STEP:AUTO OFF`.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:FREQuency:STEP <value>
[SENSe]:MCPower:FREQuency:STEP?
```

Related Commands

[SENSe]:MCPower:FREQuency:STEP:AUTO (on page 2237)

Arguments

`<value>::<NRf>` specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106AB – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:MCPOWER:FREQUENCY:STEP 50kHz` sets the frequency step size to 50 kHz.

[SENSe]:MCPower:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:MCPower:FREQuency:STEP:AUTO?
```

Arguments

`OFF` or `0` specifies that the frequency step size is set manually using the `[SENSe]:MCPower:FREQuency:STEP` command.

`ON` or `1` specifies that the frequency step size is set automatically.

Examples

`SENSe:MCPOWER:FREQUENCY:STEP:AUTO ON` specifies that the frequency step size is set automatically.

[SENSe]:MCPower:NFLoor:STATe

Determines whether to enable correction for noise floor.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:NFLoor:STATe { OFF | ON | 0 | 1 }
[SENSe]:MCPower:NFLoor:STATe?
```

Arguments

`OFF` or `0` disables correction for noise floor.

`ON` or `1` enables correction for noise floor.

Examples

`SENSe:MCPOWER:NFLOOR:STATE ON` enables correction for noise floor.

[SENSe]:MCPower:POINts:COUNt

Sets or queries the number of trace points in the MCPR display.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:POINts:COUNt { P801 | P2401 | P4001 | P8001| P10801 }
[SENSe]:MCPower:POINts:COUNt?
```

Arguments

`P801 | P2401 | P4001 | P8001 | P10801` set the number of trace points.

Examples

`SENSe:MCPOWER:POINTS:COUNT P4001` sets the number of trace points in the MCPR measurement to 4001.

[SENSe]:MCPower:RCHannels? (Query Only)

Queries the power reference in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:RCHannels?
```

Arguments

None

Returns

`<power_ref>::={ Total | M<x> }`

where `<x>` = 1 to 99.

`Total` indicates that the power reference is the total power of all the active channels.

`M<x>` indicates that the power reference is the main channel with the index (<x>).

Examples

`SENSe:MCPOWER:RCHANNELS?` might return `M3`, indicating that the power reference is the main channel.

[SENSe]:MCPower:RCHannels:MAIN<x> (No Query Form)

Sets the power reference to the main channel with the index (<x>) in the MCPR measurement.

The parameter <x> = 1 to 99, representing the main channel 1 to 99, respectively. The main channel must be defined using the `[:SENSe]:MCPower:CHANnel:MAIN` commands.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:RCHannels:MAIN<x>
```

Related Commands

[SENSe]:MCPower:CHANnel:MAIN:{BANDwidth|BWIDth} (on page 2233)

[SENSe]:MCPower:CHANnel:MAIN:COUNt (on page 2234)

[SENSe]:MCPower:CHANnel:MAIN:INACtive (on page 2234)

[SENSe]:MCPower:CHANnel:MAIN:SPACing (on page 2235)

Arguments

None

Examples

`SENSe:MCPOWER:RCHANNELS:MAIN3` selects Main 3 for the power reference channel.

[SENSe]:MCPower:RCHannels:TOTal (No Query Form)

Sets the power reference to the total power of all the active channels in the MCPR measurement.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:RCHannels:TOTal
```

Arguments

None

Examples

SENSe:MCPOWER:RCHANNELS:TOTAL sets the power reference to the total power of all the active channels.

[SENSe]:MCPower:RRCRolloff

Sets or queries the filter parameter (roll-off ratio) for the Root Raised Cosine filter.

Conditions

Measurement views: MCPR

Group

Sense commands

Syntax

```
[SENSe]:MCPower:RRCRolloff <value>
[SENSe]:MCPower:RRCRolloff?
```

Related Commands

[SENSe]:MCPower:CHANnel:FILTer (on page 2233)

Arguments

<value>::<NRf> specifies the filter parameter.

Range: 0.001 to 1, 0.0001 step.

Examples

SENSe:MCPOWER:RRCROLLOFF 0.3 sets the filter parameter to 0.3.

[SENSe]:MEASurement:FREQuency[:SOURce<z>]

Sets or queries the measurement frequency.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:MEASurement:FREQuency[:SOURce<z>] <value>
[SENSe]:MEASurement:FREQuency[:SOURce<z>]?
```

Arguments

<value>::<NRf> specifies the measurement frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:MEASurement:FREQuency:SOURCE2? 7.5GHz` sets the measurement frequency frequency of Source 2 to 7.5 GHz.

[SENSe]:MEASurement:FREQuency[:SOURce<z>]:CENTer:LOCK

Sets or queries locking the measurement center frequency.

The parameter <z> = 1 to number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Default source is Source 1.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:MEASurement:FREQuency[:SOURce<z>]:CENTer:LOCK { OFF | ON | 0 | 1 }
[SENSe]:MEASurement:FREQuency[:SOURce<z>]:CENTer:LOCK?
```

Arguments

`OFF` or 0 disables locking the center frequency.

`ON` or 1 enables locking the center frequency.

Examples

`SENSe:MEASurement:FREQuency:SOURCE1:CENTer:LOCK ON` locks the center frequency.

[SENSe]:MERRor[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Magnitude error versus Time for a selected Measurement view number

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:MERRor[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
```

[SENSe]:MERRor[:MEASview<y>]:SELEcted:SOURce?

Arguments

The parameter <y>=1 to 8 represents the measurement index based on the number of sources of connected instruments, where the MEASview keyword is optional by default and y is 1

Example

SENSe:MERRor:MEASview1:SELEcted:SOURce? queries the Source for Magnitude error versus Time Measurement View 1.

[SENSe]:NOISe:AVERage:COUNt

This command returns the acquisition counts over which the noise average is computed.

Conditions

Measurement view: Noise Figure

Group

Sense commands

Syntax

[SENSe]:NOISe:AVERage:COUNt <integer>
[SENSe]:NOISe:AVERage:COUNt?

Arguments

<integer>

Range: 1 to 1000

Returns

<NR3> = a floating point value with an exponent

Examples

SENSe:NOISE:AVERAGE:COUNT? might return 1.0000000000E+3, indicating the average count of the analyzer is set to 1000.

[SENSe]:NOISe:BANDwidth

This command sets or queries the resolution bandwidth (RBW) for the Noise Figure display measurement.

Conditions

Measurement view: Noise Figure

Group

Sense commands

Syntax

[SENSe]:NOISe:BANDwidth <NR3>
[SENSe]:NOISe:BANDwidth?

Arguments

<NR3> = a floating point value with an exponent Range: 50 Hz - 10 MHz

Returns

<NR3> = a floating point value with an exponent

Examples

SENSe:NOISE:BANDWIDTH? might return 1.0000000000E+6, indicating that the RBW is 1.00 MHz.

[SENSE]:NOISe:CONTrol:SETTling:OFF[:TIME]

This command sets or queries the analyzer off settle time for the Noise Figure display measurement.

Conditions

Measurement view: Noise Figure

Group

Sense commands

Syntax

```
[SENSE]:NOISe:CONTrol:SETTling:OFF[:TIME] <NR3>
[SENSE]:NOISe:CONTrol:SETTling:OFF[:TIME]?
```

Related Commands

[SENSE]:NOISe:CONTrol:SETTling:ON[:TIME] (on page 2243)

Arguments

<NR3> = a floating point value with an exponent Range: 0 s - 10 ks

Returns

<NR3> = a floating point value with an exponent

Examples

SENSe:NOISE:CONTROL:SETTLING:OFF:TIME? might return 200.0000000000E-3, indicating the the RSA settle time (off) is 200 ms.

[SENSE]:NOISe:CONTrol:SETTling:ON[:TIME]

This command sets or queries the analyzer on settle time for the Noise and Gain display measurements.

Conditions

Measurement views: Noise Figure, Noise Temperature, Y Factor

Group

Sense commands

Syntax

```
[SENSE]:NOISe:CONTrol:SETTling:ON[:TIME] <NR3>
[SENSE]:NOISe:CONTrol:SETTling:ON[:TIME]?
```

Related Commands

[SENSE]:NOISe:CONTrol:SETTling:OFF[:TIME] (on page 2243)

Arguments

<NR3> = a floating point value with an exponent Range: 0 s - 10 ks

Returns

<NR3> = a floating point value with an exponent

Examples

SENSe:NOISE:CONTROL:SETTLING:ON:TIME? might return 50.0000000000E-3, indicating the RSA settle time (on) is 50 ms.

[SENSe]:NOISe:CORRection:ENR:CONSTant

This command sets and queries the excess noise ratio (ENR) constant for the Noise Figure and Gain displays.

Conditions

Measurement view: Noise Figure, Y Factor, Gain, Noise Temperature, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:ENR:CONSTant <NR2>
[SENSe]:NOISe:CORRection:ENR:CONSTant?
```

Related Commands

[SENSe]:NOISe:CORRection:ENR:MODE (on page 2244)

Arguments

<NR2> = a floating point value without an exponent

Returns

<NR2> = a floating point value without an exponent

Examples

SENSe:NOISE:CORRECTION:ENR:CONSTANT? might return 10.0000000000, indicating that the ENR constant is 10.00 dB.

[SENSe]:NOISe:CORRection:ENR:MODE

This command sets and queries the Noise Source mode for the Noise Figure and Gain displays.

Conditions

Measurement view: Noise Figure, Y Factor, Gain, Noise Temperature, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:ENR:MODE { TABLe | CONSTant }
[SENSe]:NOISe:CORRection:ENR:MODE?
```

Related Commands

[SENSe]:NOISe:CORRection:ENR:CONSTant (on page 2244)

Arguments

`TABLe` sets the noise source mode to Table.

`CONSTant` sets the noise source mode to Constant.

Returns

`TABL` indicates that the noise source mode is set to Table.

`CONST` indicates that the noise source mode is set to Constant.

Examples

`SENSe:NOISE:CORRECTION:ENR:MODE?` might return `TABL`, indicating that the noise source mode is set to Table.

[SENSe]:NOISe:CORRection:ENR:TABLe:DATA? (Query Only)

This command queries the Noise Source model, serial number, and table values for frequency and ENR for the Noise Figure and Gain displays.

Conditions

Measurement view: Noise Figure, Y Factor, Gain, Noise Temperature, Noise Table

Group

Sense commands

Syntax

`[SENSe]:NOISe:CORRection:ENR:TABLe:DATA?`

Related Commands

[SENSe]:NOISe:CORRection:ENR:MODE (on page 2244)

[SENSe]:NOISe:CORRection:ENR:TABLe:ID (on page 2245)

Returns

`<string>` is the Noise Source model and serial number, as well as the frequency and ENR values for the noise source table.

Examples

`SENSe:NOISE:CORRECTION:ENR:TABLE:DATA?` might return `346B 10MHz – 18 GHz, 2037A02333, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15, 2900000000, 15`. The first two values indicate the Noise Source model and serial numbers. All of the values that follow indicate the frequency (2900000000, meaning 2.90 GHz) and the ENR (15, meaning 15.00 dB) shown in the Noise Source table.

[SENSe]:NOISe:CORRection:ENR:TABLe:ID

This command sets or queries the Noise Source Model for the Noise Figure and Gain displays.

Conditions

Measurement view: Noise Figure, Y Factor, Gain, Noise Temperature, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:ENR:TABLe:ID <Qstring>
[SENSe]:NOISe:CORRection:ENR:TABLe:ID?
```

Related Commands

[SENSe]:NOISe:CORRection:ENR:TABLe:DATA? (on page 2245)

Arguments

`<Qstring>` = quoted string of ASCII text

Returns

`<Qstring>` = quoted string of ASCII text

Examples

`SENSe:NOISE:CORRECTION:ENR:TABLE:ID?` might return “346B 10MHz – 18 GHz”, indicating the Noise Source model is 346B 10 MHz–18 GHz.

[SENSe]:NOISe:CORRection:ENR:TABLe:NEW (No Query Form)

This command sets the Noise Source Model for the Noise Figure and Gain displays.

Conditions

Measurement view: Noise Figure, Y Factor, Gain, Noise Temperature, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:ENR:TABLe:NEW <Qstring>
[SENSe]:NOISe:CORRection:ENR:TABLe:NEW?
```

Related Commands

[SENSe]:NOISe:CORRection:ENR:TABLe:DATA? (on page 2245)

Arguments

`<Qstring>` = quoted string of ASCII text

Returns

`<Qstring>` = quoted string of ASCII text

Examples

`SENSe:NOISE:CORRECTION:ENR:TABLE:NEW?` might return `"346B 10 MHz - 18 GHz"`, indicating the Noise Source model is 346B 10 MHz–18 GHz.

[SENSe]:NOISe:CORRection:ENR:TABLe:SERial

This command sets or queries the Noise Source serial number for the Noise Figure and Gain displays.

Conditions

Measurement view: Noise Figure, Y Factor, Gain, Noise Temperature, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:ENR:TABLe:SERial <Qstring>
[SENSe]:NOISe:CORRection:ENR:TABLe:SERial?
```

Related Commands

[SENSe]:NOISe:CORRection:ENR:TABLe:DATA? (on page 2245)

Arguments

`<Qstring>` = quoted string of ASCII text

Returns

`<Qstring>` = quoted string of ASCII text

Examples

`SENSe:NOISE:CORRECTION:ENR:TABLE:SERIAL?` might return “2037A02334”, indicating the Noise Source serial number is 2037A02334.

[SENSe]:NOISe:CORRection:TCOLd:ADUT:UREFerence

Sets or queries the analyzer to use the reference temperature (K) for the loss at the DUT output in the noise displays.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:TCOLd:ADUT:UREFerence { OFF | ON| 1 | 0 }
[SENSe]:NOISe:CORRection:TCOLd:ADUT:UREFerence?
```

Arguments

`OFF` or `0` disables the Use Ref temperature feature for the Loss at DUT Output.

`ON` or `1` enables the Use Ref temperature feature for the Loss at DUT Output.

Returns

0 means that the Use Ref temperature feature for the Loss at DUT Output is disabled.

1 means that the Use Ref temperature feature for the Loss at DUT Output is enabled.

Examples

SENSe:NOIS:CORR:TCOL:ADUT:UREF? might return 1, indicating that the temperature for the loss at the DUT output is set to Use Reference temperature.

[SENSe]:NOISe:CORRection:TCOLd:ADUT[:VALue]

Sets or queries the temperature value (K) for the loss at the DUT output in the noise displays.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:TCOLd:ADUT[:VALue] <NR3>
[SENSe]:NOISe:CORRection:TCOLd:ADUT[:VALue]?
```

Arguments

<NR3> = floating point value with an exponent.

Range: 0 K to 500 K

Returns

<NR2> = floating point value without an exponent, which is the temperature in Kelvin.

Examples

SENSe:NOIS:CORR:TCOL:ADUT:VAL? might return 100.0000000000, indicating that the temperature for the loss at the DUT output is 100 K.

[SENSe]:NOISe:CORRection:TCOLd:BDUT:UREFerence

Sets or queries the analyzer to use the reference temperature (K) for the loss at the DUT input in the noise displays.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, and Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:TCOLd:BDUT:UREFerence { OFF | ON| 1 | 0 }
[SENSe]:NOISe:CORRection:TCOLd:BDUT:UREFerence?
```

Arguments

OFF or 0 disables the Use Ref temperature feature for the Loss at DUT Input.

ON or 1 enables the Use Ref temperature feature for the Loss at DUT Input.

Returns

0 means that the Use Ref temperature feature for the Loss at DUT Input is disabled.

1 means that the Use Ref temperature feature for the Loss at DUT Input is enabled.

Examples

SENSe:NOIS:CORR:TCOL:BDUT:UREF? might return 1, indicating that the temperature for the loss at the DUT input is set to Use Reference temperature.

[SENSe]:NOISe:CORRection:TCOLd:BDUT[:VALue]

Sets or queries the temperature value (K) for the loss at the DUT input in the noise displays.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:TCOLd:BDUT[:VALue] <NR3>
[SENSe]:NOISe:CORRection:TCOLd:BDUT[:VALue]?
```

Arguments

<NR3> = floating point value with an exponent.

Range: 0 K to 500 K

Returns

<NR2> = floating point value without an exponent, which is the temperature in Kelvin.

Examples

SENSe:NOIS:CORR:TCOL:BDUT:VAL 290 sets the temperature for the loss at the DUT input to 290 K.

[SENSe]:NOISe:CORRection:TCOLd[:REFerence]

Sets or queries the reference temperature value (K) in the noise display.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:CORRection:TCOLd[:REFerence] <NR3>
[SENSe]:NOISe:CORRection:TCOLd[:REFerence]?
```

Arguments

<NR3> = floating point value with an exponent.

Range: 0 K to 500 K

Returns

<NR2> = floating point value without an exponent, which is the reference temperature in Kelvin.

Examples

SENSe:NOIS:CORR:TCOL:REF 200 sets the reference temperature to 200 K.

[SENSe]:NOISe:FIGure:POINTs:COUNt (No Query Form)

Sets the number of sample points for the Noise Figure display.

Conditions

Measurement views: Noise Figure

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FIGure:POINTs:COUNt { P801 | P2401 | P4001 | P8001 | P10401 }
```

Arguments

P801 sets the number of sample points to 801.

P2401 sets the number of sample points to 2401.

P4001 sets the number of sample points to 4001.

P8001 sets the number of sample points to 8001.

P10401 sets the number of sample points to 10401.

Examples

SENSe:NOISE:FIGURE:POINTS:COUNT P801 sets the number of sample points to 801.

[SENSe]:NOISe:FREQuency:CENTer

Sets or queries the center frequency value (Hz).

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:CENTer <NRf>
[SENSe]:NOISe:FREQuency:CENTer?
```

Arguments

<NRf> is the center frequency value in Hz.

Range: 0 Hz to 6.2 GHz

Returns

<NR3> = floating point value with an exponent, which is the center frequency value.

Examples

SENSe:NOISE:FREQUENCY:CENTER 5.0 GHz sets the center frequency in the active noise display to 5.0000 GHz.

SENSe:NOISE:FREQUENCY:CENTER? might return 6.2000000000E+9, indicating that the center frequency in the active noise display is 6.2000 GHz.

[SENSe]:NOISe:FREQuency:MODE

Sets or queries the frequency mode in the noise display.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:MODE { TABLe | SINGle | SWEPt }
[SENSe]:NOISe:FREQuency:MODE?
```

Arguments

TABLe: sets the frequency mode to Frequency Table.

SINGle: sets the frequency mode to Single Frequency.

SWEPt: sets the frequency mode to Sweep Frequency.

Returns

TABL: means the frequency mode is set to Frequency Table.

SING: means the frequency mode is set to Single Frequency.

SWEP: means the frequency mode is set to Sweep Frequency.

Examples

SENSe:NOIS:FREQ:MODE TABL sets the frequency mode to Frequency Table in the noise display.

[SENSe]:NOISe:FREQuency:SPAN

Sets or queries the frequency Span value (Hz).

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:SPAN <NRf>
[SENSe]:NOISe:FREQuency:SPAN?
```

Arguments

<NRf> is the frequency Span value in Hz.

Range: 100 Hz to 6.2 GHz

Returns

<NR3> = floating point value with an exponent, which is the frequency Span value.

Examples

SENSe:NOISE:FREQUENCY:SPAN 3.0 GHz sets the frequency Span in the active noise display to 3.0000 GHz.

SENSe:NOISE:FREQUENCY:SPAN? might return 100.000000000E+3, indicating that the frequency Span in the active noise display is 100 kHz.

[SENSe]:NOISe:FREQuency:STARt

Sets or queries the Start Frequency value.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:STARt <NRf>
[SENSe]:NOISe:FREQuency:STARt?
```

Arguments

<NRf> is the Start Frequency value.

Returns

<NR3> = floating point value with an exponent, which is the Start Frequency value.

Examples

SENSe:NOISE:FREQUENCY:START 1.5 GHz sets the Start Frequency in the active noise display to 1.5000 GHz.

SENSe:NOISE:FREQUENCY:START? might return 1.5000000000E+9, indicating that the Start Frequency in the active noise display is 1.5000 GHz.

[SENSe]:NOISe:FREQuency:STEPs

Sets or queries the frequency Steps value.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:STEPs <NRf>
[SENSe]:NOISe:FREQuency:STEPs?
```

Arguments

<NRf> is the Steps value.

Range: 2 to 999

Returns

<NRf> is the Steps value.

Examples

SENSe:NOISE:FREQUENCY:STEPS 11 sets the frequency Steps value in the active noise display to 11.

[SENSe]:NOISe:FREQuency:STOP

Sets or queries the Stop Frequency value.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:STOP <NRf>
[SENSe]:NOISe:FREQuency:STOP?
```

Arguments

<NRf> is the Stop Frequency value.

Returns

<NR3> = floating point value with an exponent, which is the Stop Frequency value.

Examples

SENSe:NOISE:FREQUENCY:STOP 1.5 GHz sets the Stop Frequency in the active noise display to 1.5000 GHz.

SENSe:NOISE:FREQUENCY:STOP? might return 1.5000000000E+9, indicating that the Stop Frequency in the active noise display is 1.5000 GHz.

[SENSe]:NOISe:FREQuency:TABLe:DATA? (Query Only)

Queries the data in the Frequency Table for the noise display.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:TABLe:DATA?
```

Returns

<string> which contains each frequency value (Hz) in the frequency table for the noise display.

Examples

`SENSe:NOISE:FREQUENCY:TABLE:DATA?` might return `"1500000000, 1505000005, 1510000010, 1515000015,1520000020, 1525000025, 1530000030, 1545000045, 1550000050"`, indicating each frequency in the Frequency Table.

[SENSe]:NOISe:FREQuency:TABLe:NEW (No Query Form)

Creates a new Frequency Table with the specified values for the noise display.

Conditions

Measurement views: Noise Figure, Gain, Noise Temperature, Y Factor, Noise Table

Group

Sense commands

Syntax

```
[SENSe]:NOISe:FREQuency:TABLe:NEW <string>
```

Arguments

`<string> = "<NR3>,<NR3>,<NR3>,..."`

Examples

`SENSe:NOISE:FREQUENCY:TABLE:NEW "1.2e9,1.5e9,1.452e9"` sets 3 step values in a new Frequency Table to 1.200 GHz, 1.350 GHz, and 1.500 GHz.

[SENSe]:OBWidth:AVERage

Sets or queries whether to enable averaging in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:AVERage { OFF | ON | 0 | 1 }
[SENSe]:OBWidth:AVERage?
```

Arguments

`OFF` or `0` disables averaging.

`ON` or `1` enables averaging.

Examples

`SENSe:OBWIDTH:AVERAGE ON` enables averaging.

[SENSe]:OBWidth:AVERage:COUNt

Sets or queries the number of measurements for averaging in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:AVERage:COUNt <number>
[SENSe]:OBWidth:AVERage:COUNt?
```

Arguments

`<number>::<NR1>` specifies the average count. Range: 2 to 10000.

Examples

`SENSe:OBWIDTH:AVERAGE:COUNT 64` sets the average count to 64.

[SENSe]:OBWidth:{BANDwidth|BWIDth}:MEASurement

Sets or queries the measurement bandwidth to determine the total power in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:{BANDwidth|BWIDth}:MEASurement <value>
[SENSe]:OBWidth:{BANDwidth|BWIDth}:MEASurement?
```

Arguments

`<value>::<NRf>` specifies the measurement bandwidth.

Range: 100 Hz to 109 MHz.

Examples

`SENSe:OBWIDTH:BANDWIDTH:MEASUREMENT 10MHz` sets the measurement bandwidth to 10 MHz.

[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW). Programming a specified RBW sets `[SENSe]:OBWidth{BANDwidth|BWIDth}[:RESolution]:AUTO OFF`.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]?
```

Related Commands

[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]:AUTO (on page 2256)

Arguments

<value>::<NRf> specifies the RBW. Range: 100 Hz to 5 MHz.

Examples

SENSe:OBWIDTH:BANDWIDTH:RESOLUTION 200kHz sets the RBW to 200 kHz.

[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]:ACTual? (Query Only)

Queries the actual resolution bandwidth (RBW) in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]:ACTual?
```

Arguments

None

Returns

<NRf> The actual RBW in Hz.

Examples

SENSe:OBWIDTH:BANDWIDTH:RESOLUTION:ACTUAL? might return 299.624E+3, indicating that the actual RBW is 299.624 kHz.

[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]:AUTO { OFF | ON | 0 | 1 }
[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]:AUTO?
```

Arguments

`OFF` or `0` specifies that the RBW is set manually using the `[SENSe]:OBWidth:{BANDwidth|BWIDth}[:RESolution]` command.

`ON` or `1` specifies that the RBW is set automatically.

Examples

`SENSe:OBWIDTH:BANDWIDTH:AUTO ON` sets the RBW automatically.

[SENSe]:OBWidth:{BANDwidth|BWIDth}:VIDeo

Sets or queries the video bandwidth (VBW). Programming a specified VBW sets `[SENSe]:OBWidth{BANDwidth|BWIDth}:VIDeo:STATe OFF`.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:{BANDwidth|BWIDth}:VIDeo <value>
[SENSe]:OBWidth:{BANDwidth|BWIDth}:VIDeo?
```

Arguments

`<value>::<NRf>` specifies the VBW.

Range: Current RBW/104 (1 Hz minimum) to Current RBW.

Examples

`SENSe:OBWIDTH:BANDWIDTH:VIDEO 200kHz` sets the VBW to 200 kHz.

[SENSe]:OBWidth:{BANDwidth|BWIDth}:VIDeo:STATe

Determines whether to enable the video bandwidth (VBW) in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:{BANDwidth|BWIDth}:VIDeo:STATe { OFF | ON| 0 | 1 }
[SENSe]:OBWidth:{BANDwidth|BWIDth}:VIDeo:STATe?
```

Arguments

`OFF` or `0` disables the VBW.

`ON` or `1` enables the VBW.

Examples

`SENSe:OBWIDTH:BANDWIDTH:VIDEO:STATE ON` enables the VBW.

[SENSe]:OBWidth:BOBW:XDBM:MEASurement:DIREction

Sets or queries the measurement direction in the Bluetooth window.

Conditions

Measurement views:Bluetooth 20 dB Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:BOBW:XDBM:MEASurement:DIREction {IN|OUT}
[SENSe]:OBWidth:BOBW:XDBM:MEASurement:DIREction?
```

Arguments

`IN` specifies the inward direction

`OUT` specifies the outward direction.

Examples

`SENSe:OBWIDTH:BOBW:XDBM:MEASUREMENT:DIRECTION?` might return `IN`, indicating the measurement direction is set to IN.

[SENSe]:OBWidth:BOBW:XDBM:RANGe

Sets or queries the measurement range in the Bluetooth window.

Conditions

Measurement views:Bluetooth 20 dB Bandwidth

The x dBm option should be selected. If the x dB option is selected, the Range is always set to BOTH.

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:BOBW:XDBM:RANGe {BOTH|LOW|HIGH}
[SENSe]:OBWidth:BOBW:XDBM:RANGe?
```

Arguments

`BOTH` specifies both the high and low ranges.

`LOW` specifies the lower range.

`HIGH` specifies the higher range.

Examples

`SENSe:OBWIDTH:BOBW:XDBM:RANGE LOW` sets the measurement range to the lower range.

[SENSe]:OBWidth:CLEar:RESults (No Query Form)

Restarts the average trace. This command is valid when `[SENSe]:OBWidth:AVERage` is set to ON.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:CLEar:RESults
```

Arguments

None

Examples

`SENSe:OBWIDTH:CLEAR:RESULTS` restarts the average trace.

[SENSe]:OBWidth:FREQuency:CENTer

Sets or queries the center frequency in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:FREQuency:CENTer <value>
[SENSe]:OBWidth:FREQuency:CENTer?
```

Arguments

`<value>::<NRf>` specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:OBWIDTH:FREQUENCY:CENTER 7.5GHz` sets the center frequency to 7.5 GHz.

[SENSe]:OBWidth:FREQuency:STEP

Sets or queries the frequency step size in the Occupied Bandwidth measurement. Programming a specified step size sets `[SENSe]:OBWidth:FREQuency:STEP:AUTO OFF`.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:FREQuency:STEP <value>
[SENSe]:OBWidth:FREQuency:STEP?
```

Related Commands

[SENSe]:OBWidth:FREQuency:STEP:AUTO (on page 2260)

Arguments

`<value>::<NRf>` specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:OBWIDTH:FREQUENCY:STEP 1kHz` sets the frequency step size to 1 kHz.

[SENSe]:OBWidth:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually in the Occupied Bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:FREQuency:STEP:AUTO{OFF|ON|0|1}
[SENSe]:OBWidth:FREQuency:STEP:AUTO?
```

Arguments

`OFF` or `0` specifies that the frequency step size is set manually using the `[SENSe]:OBWidth:FREQuency:STEP` command.

`ON` or `1` specifies that the frequency step size is set automatically.

Examples

`SENSe:OBWIDTH:FREQUENCY:STEP:AUTO ON` specifies that the frequency step size is set automatically.

[SENSe]:OBWidth:PERCent

Sets or queries the occupied bandwidth percent power (power ratio of the occupied bandwidth to the measurement bandwidth).

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:PERCent <value>
[SENSe]:OBWidth:PERCent?
```

Arguments

`<value>::<NRf>` specifies the occupied bandwidth percent power.

Range: 50 to 99.9%.

Examples

`SENSe:OBWIDTH:PERCENT 98` sets the occupied bandwidth percent power to 98%.

[SENSe]:OBWidth:XDBLevel

Sets or queries the x dB level (how far down from the peak level the bandwidth is measured) in the x dB bandwidth measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Sense commands

Syntax

```
[SENSe]:OBWidth:XDBLevel <value>
[SENSe]:OBWidth:XDBLevel?
```

Arguments

`<value>::<NRf>` specifies the x dB level. Range: -80 to -1 dB.

Examples

`SENSe:OBWIDTH:XDBLEVEL -10` sets the x dB level to -10 dB.

[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]

Sets or queries the channel bandwidth in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth] <value>
[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]?
```

Arguments

`<value>::<NRf>` specifies the channel bandwidth.

Examples

`SENSe:OFDM:CHANNEL[:BANDWIDTH|BWIDTH] 20E+6` sets the channel bandwidth to 20 MHz.

[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]:SRATe? (Query Only)

Returns the FFT sample rate for the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

`[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]:SRATe?`

Arguments

None

Returns

`<NRf>` The sample rate in Hz.

Examples

`SENSe:OFDM:CHANNEL[:BANDWIDTH|BWIDTH]:SRATE?` might return `20E+6`, indicating the sample rate is 20 MHz.

[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]:STATe

Determines whether the channel bandwidth is on or off in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]:STATe{OFF|ON|0|1}
[SENSe]:OFDM:CHANnel[:BANDwidth|BWIDth]:STATe?
```

Arguments

`OFF` or `0` specifies that the channel bandwidth is off.

`ON` or `1` specifies that the channel bandwidth is on.

Examples

`SENSe:OFDM:CHANNEL[:BANDWIDTH|BWIDTH]:STATE ON` sets the channel bandwidth setting to on.

[SENSe]:OFDM:CHANnel:ESTimation

Sets or queries the channel estimation in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:CHANnel:ESTimation{PREamble|PDATa}
[SENSe]:OFDM:CHANnel:ESTimation?
```

Arguments

`PREamble` specifies the channel estimation is Preamble.

`PDATa` specifies the channel estimation is Preamble + Data.

Examples

`SENSe:OFDM:CHANNEL:ESTIMATION PDAT` sets the channel estimation to Preamble + Data.

[SENSe]:OFDM:CONSte:DETermination

Sets or queries the constellation determination in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:CONSte:DETermination{AUTO|MANual}
[SENSe]:OFDM:CONSte:DETermination?
```

Arguments

`AUTO` specifies the instrument automatically detects the constellation determination.

`MANual` allows you to select a manual constellation type.

Examples

`SENSe:OFDM:CONSTE:DETERMINATION MAN` sets the constellation determination so you can select a manual constellation type using the `SENSe:OFDM:CONSte:DETermination:MANual` command.

[SENSe]:OFDM:CONSte:DETermination:MANual

Sets or queries a manual constellation type. The Constellation determination must be set to Manual using the `[SENSe]:OFDM:CONSte:DETermination` command.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:CONSte:DETermination:MANual{BPSK|QAM16|QAM64|QPSK}
[SENSe]:OFDM:CONSte:DETermination:MANual?
```

Related Commands

[SENSe]:OFDM:CONSte:DETermination (on page 2263)

Arguments

`BPSK` specifies the BPSKconstellation type.

`QAM16` specifies the QAM16 constellation type.

`QAM64` specifies the QAM16 constellation type.

`QPSK` specifies the QPSK constellation type.

Examples

`SENSe:OFDM:CONSTE:DETERMINATION:MANUAL QPSK` selects the QPSK constellation type.

[SENSe]:OFDM:GUARd:INTerval

Sets or queries the guard interval in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:GUARd:INTerval{FOURth|EIGHth|SIXTeenth|THIRtysecond|USER}
```

Arguments

`FOURth` specifies the guard interval is set to 1/4.

`EIGHth` specifies the guard interval is set to 1/8.

`SIXTeenth` specifies the guard interval is set to 1/16.

`THIRtysecond` specifies the guard interval is set to 1/32.

`USER` specifies a user-defined guard interval.

Examples

`SENSe:OFDM:GUARD:INTERVAL THIR` sets the guard interval to 1/32.

[SENSe]:OFDM:GUARd:INTerval:USER

Sets or queries a user-defined guard interval. The Guard Interval must be set to USER.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:GUARd:INTerval:USER <value>
[SENSe]:OFDM:GUARd:INTerval:USER?
```

Related Commands

[SENSe]:OFDM:GUARd:INTerval (on page 2264)

Arguments

`<value>::<NRf>` specifies the guard interval.

Examples

`SENSe:OFDM:GUARD:INTERVAL:USER 3.12` sets the guard interval to 3.12%.

[SENSe]:OFDM:PILot:TRACking:AMPLitude:STATe

Determines whether to select the Amplitude pilot tracking in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:PILot:TRACking:AMPLitude:STATe { OFF | ON | 0 | 1 }
[SENSe]:OFDM:PILot:TRACking:AMPLitude:STATe?
```

Arguments

`OFF` or `0` specifies that the Amplitude pilot tracking is off.

`ON` or `1` specifies that the Amplitude pilot tracking is on.

Examples

`SENSe:OFDM:PILOT:TRACKING:AMPLITUDE:STATE ON` turns the Amplitude pilot tracking on.

[SENSe]:OFDM:PILot:TRACking:PHASe:STATe

Determines whether to select the Phase pilot tracking in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:PILot:TRACking:PHASe:STATe {OFF|ON|0|1}
```

Arguments

`OFF` or `0` specifies that the Phase pilot tracking is off.

`ON` or `1` specifies that the Phase pilot tracking is on.

Examples

`SENSe:OFDM:PILOT:TRACKING:PHASE:STATE ON` turns the Phase pilot tracking on.

[SENSe]:OFDM:PILot:TRACking:TIMing:STATe

Determines whether to select the Timing pilot tracking in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:PILot:TRACking:TIMing:STATe {OFF|ON|0|1}
```

Arguments

`OFF` or `0` specifies that the Timing pilot tracking is off.

`ON` or `1` specifies that the Timing pilot tracking is on.

Examples

`SENSe:OFDM:PILOT:TRACKING:TIMING:STATE ON` turns the Timing pilot tracking on.

[SENSe]:OFDM:RADix (No Query Form)

Sets the radix for the OFDM measurements. This command is effective in the symbol table.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:RADix { BINary | HEX }
```

Arguments

Returns

`BINary` specifies the binary radix.

`HEX` specifies the hexadecimal radix.

Examples

SENSe:OFDM:RADIX HEX sets the radix to hexadecimal for the OFDM symbol table.

[SENSe]:OFDM:SCARrier:SPACing

Sets or queries the subcarrier spacing in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SCARrier:SPACing <value>
[SENSe]:OFDM:SCARrier:SPACing?
```

Arguments

<value>::<NRf> specifies the subcarrier spacing.

Examples

SENSe:OFDM:SCARRIER:SPACING 312.5E+3 sets the subcarrier spacing to 312.5 MHz.

[SENSe]:OFDM:SCARrier:SPACing:STATe

Determines whether the subcarrier spacing is on or off in the OFDM view

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SCARrier:SPACing:STATe{OFF|ON|0|1}
[SENSe]:OFDM:SCARrier:SPACing:STATe?
```

Arguments

OFF or 0 specifies that the subcarrier spacing is off.

ON or 1 specifies that the subcarrier spacing is on.

Examples

SENSe:OFDM:SCARRIER:SPACING:STATE ON sets the subcarrier spacing to on.

[SENSe]:OFDM:SCARriers

Sets or queries the Subcarriers to display in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SCARriers { ALL | PILot | DATA | RANGe | SINGle}
[SENSe]:OFDM:SCARriers?
```

Arguments

`ALL` specifies that all subcarriers will be displayed.

`PILot` specifies that only the pilot subcarriers will be displayed.

`DATA` specifies that only the data subcarriers will be displayed.

`RANGe` specifies that the subcarriers within a specified range will be displayed.

`SINGle` specifies that only a single subcarrier will be displayed.

Examples

`SENSe:OFDM:SCARRIERS ALL` sets the OFDM view to display all subcarriers.

[SENSe]:OFDM:SCARriers:RANGe:STARt

Sets or queries the subcarrier start range in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SCARriers:RANGe:STARt <value>
[SENSe]:OFDM:SCARriers:RANGe:STARt?
```

Related Commands

[SENSe]:OFDM:SCARriers:RANGe:STOP (on page 2268)

Arguments

`<NR1>`

Examples

`SENSe:OFDM:SCARRIERS:RANGE:START -20` sets the subcarrier start range to –20.

[SENSe]:OFDM:SCARriers:RANGe:STOP

Sets or queries the subcarrier stop range in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SCARriers:RANGe:STOP <value>
[SENSe]:OFDM:SCARriers:RANGe:STOP?
```

Related Commands

[SENSe]:OFDM:SCARriers:RANGe:STARt (on page 2268)

Arguments

<NR1>

Examples

SENSe:OFDM:SCARRIERS:RANGE:STOP 20 sets the subcarrier stop range to 20.

[SENSe]:OFDM:SCARriers:SINGle:INDex

Sets or queries the index of a single subcarrier in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SCARriers:SINGle:INDex <Value>
[SENSe]:OFDM:SCARriers:SINGle:INDex?
```

Arguments

<NR1>

Examples

SENSe:OFDM:SCARRIERS:SINGLE:INDEX -10 sets the single subcarrier index to −10.

[SENSe]:OFDM:FFT:LENGth? (Query Only)

Returns the FFT length for the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:FFT:LENGth?
```

Arguments

None

Returns

<NR1> The FFT length.

Examples

SENSe:OFDM:FFT:LENGTH? might return the FFT length as 64.

[SENSe]:OFDM:STANdard

Sets or queries the OFDM standard.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:STANdard { S802_11 | S802_16 }
[SENSe]:OFDM:STANdard?
```

Arguments

S802_11 specifies the 802.11a/g/j OFDM standard.

S802_16 specifies the 802.16 (2004) standard.

Examples

SENSe:OFDM:STANDARD S802_16 sets the OFDM standard to 802.16.

[SENSe]:OFDM:SWAP:IQ

Determines whether or not to exchange I and Q data before demodulating.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SWAP:IQ{OFF|ON|0|1}
[SENSe]:OFDM:SWAP:IQ?
```

Arguments

OFF or 0 uses I and Q data as they are.

ON or 1 exchanges I and Q data.

Examples

SENSe:OFDM:SWAP:IQ ON exchanges I and Q data before demodulating.

[SENSe]:OFDM:SYMBol:ANALysis:OFFSet

Sets or queries the OFDM symbol analysis offset.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBol:ANALysis:OFFSet <value>
[SENSe]:OFDM:SYMBol:ANALysis:OFFSet?
```

Arguments

`<value>` specifies the symbol analysis offset as a percentage.

Range 0 to −100%.

Examples

`SENSe:OFDM:SYMBOL:ANALYSIS:OFFSET −50` sets the symbol analysis offset to −50%.

[SENSe]:OFDM:SYMBols

Sets or queries the symbols to display in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBols{ALL|RANGe|SINGle}
[SENSe]:OFDM:SYMBols?
```

Arguments

`ALL` specifies that all symbols will be displayed.

`RANGe` specifies that a range of symbols will be displayed.

`SINGle` specifies that single symbol will be displayed.

Examples

`SENSe:OFDM:SYMBOLS ALL` specifies that all symbols will be displayed in the OFDM views.

[SENSe]:OFDM:SYMBols:MAX

Sets or queries the maximum number of symbols to analyze in the OFDM views.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBols:MAX <value>
[SENSe]:OFDM:SYMBols:MAX?
```

Arguments

<NR1>

Examples

SENSe:OFDM:SYMBOLS:MAX 50 specifies a maximum of 50 symbols to analyze in the OFDM views.

[SENSe]:OFDM:SYMBols:MAX:STATe

Enables or disables the maximum number of symbols to analyze in the OFDM view.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBols:MAX:STATe{OFF|ON|0|1}
[SENSe]:OFDM:SYMBols:MAX:STATe?
```

Related Commands

[SENSe]:OFDM:SYMBols:MAX (on page 2271)

Arguments

OFF or 0 disables the maximum number of symbols to analyze.

ON or 1 enables the maximum number of symbols to analyze.

Examples

SENSe:OFDM:SYMBOLS:MAX:STATE ON enables the number of symbols to analyze in the OFDM view. The number is specified by the [SENSe]:OFDM:SYMBols:MAX command.

[SENSe]:OFDM:SYMBols:RANGe:COUNt

Sets or queries the number of symbols to display in the OFDM view when displaying a range of symbols.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBols:RANGe:COUNt<value>
[SENSe]:OFDM:SYMBols:RANGe:COUNt?
```

Arguments

<NR1>

Examples

SENSe:OFDM:SYMBOLS:RANGE:COUNT 25 sets the number of symbols to display to 25.

[SENSe]:OFDM:SYMBols:RANGe:STARt

Sets or queries the symbols start range in the OFDM view when displaying a range of symbols.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBols:RANGe:STARt <value>
[SENSe]:OFDM:SYMBols:RANGe:STARt?
```

Arguments

<NR1>

Examples

SENSe:OFDM:SYMBOLS:RANGE:START 0 sets the start range to 0.

[SENSe]:OFDM:SYMBols:SINGle:INDex

Sets or queries the symbol index in the OFDM view when displaying a single symbol.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:SYMBols:SINGle:INDex <value>
[SENSe]:OFDM:SYMBols:SINGle:INDex?
```

Arguments

<NR1>

Examples

SENSe:OFDM:SYMBOLS:SINGLE:INDEX 0 sets the index to 0.

[SENSe]:OFDM:UNIT:FREQuency (No Query Form)

Specifies the frequency units for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:UNIT:FREQuency{FREQuency|SCARrier}
```

Arguments

`FREQuency` sets the frequency units to frequency.

`SCARrier` sets the frequency units to subcarriers.

Examples

`SENSe:OFDM:UNIT:FREQUENCY FREQ` sets the frequency units to frequency.

[SENSe]:OFDM:UNIT:TIME (No Query Form)

Specifies the time units for the OFDM measurement.

Conditions

Measurement views: OFDM

Group

Sense commands

Syntax

```
[SENSe]:OFDM:UNIT:TIME{SEConds|SYMBols}
```

Arguments

`SEConds` sets the time units to seconds.

`SYMBols` sets the time units to symbols.

Examples

`SENSe:OFDM:UNIT:TIME SEC` sets the time units to seconds.

[SENSe]:P25:ANALysis:OFFSet

Sets or queries the Analysis Offset value from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:ANALysis:OFFSet <value>
```

Arguments

`<NRf>`

Examples

`SENSe:P25:ANALYSIS:OFFSET 2` sets the Analysis Offset value to 2.

[SENSe]:P25:ANALysis:OFFSet:AUTO

Sets or queries the Analysis Offset auto checkbox selection from P25 display.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:ANALysis:OFFSet:AUTO <value>
```

Arguments

`0` unchecks the checkbox.

`1` checks the checkbox.

Returns

0 or 1, `<NRf>`

Examples

`SENSe:P25:ANALYSIS:OFFSET:AUTO 1` enables the Analysis Offset auto checkbox in P25 display.

[SENSe]:P25([:BANDwidth]|:BWIDth):MODE

Sets or queries the Measurement BW (bandwidth) (frequency span) mode as Auto, Manual, or Link to Span.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25([:BANDwidth]|:BWIDth):MODE {MANual|AUTO|LSP}
[SENSe]:P25([:BANDwidth]|:BWIDth):MODE?
```

Arguments

`MANual` sets the analyzer to allow for manual selection of the measurement bandwidth. A typical use is setting a narrow measurement bandwidth on a small range of frequencies to examine one signal while rejecting the others that are present in a Spectrum graph.

`AUTO` sets analyzer to automatically select a measurement bandwidth. The measurement picks a bandwidth based on other parameter settings (such as symbol rate and modulation type).

`LSP` sets the Measurement BW to Link to Span. This allows you to use the Spectrum display to tune the frequency, view the signal, and then use the Span control to set the measurement bandwidth. This mode emulates legacy instruments.

Returns

MAN means the Measurement BW is set to Manual.

AUTO means the Measurement BW is set to Automatic.

LSP means the Measurement BW is set to Link to Span.

Examples

`SENSe:P25:BAND:MODE?` might return `MAN`, indicating the Measurement BW mode is set to AUTO.

[SENSe]:P25([:BANDwidth]|:BWIDth):TINTerval

Sets or queries the Measurement BW (bandwidth) (frequency span). Setting the Measurement BW changes this setting from Auto to Manual if it is set to Auto before you use the command. A query will not change that setting.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25([:BANDwidth]|:BWIDth):TINTerval <NRf>
[SENSe]:P25([:BANDwidth]|:BWIDth):TINTerval?
```

Arguments

`<NRf>` specifies the measurement bandwidth in kHz.

Returns

`<NR3>` = a floating point value with an exponent, which is the Measurement BW value in kHz.

Examples

`SENSe:P25:BAND:INT?` might return `153.6000000000E+3`, which indicates the Measurement BW value is 153.6 kHz.

[SENSe]:P25([:BANDwidth]|:BWIDth):TINTerval:AUTO

Sets or queries the Measurement BW (bandwidth) (frequency span) mode as Auto or Manual.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25([:BANDwidth]|:BWIDth):TINTerval:AUTO {0|1|OFF|ON}
[SENSe]:P25([:BANDwidth]|:BWIDth):TINTerval:AUTO?
```

Arguments

`OFF` or `0` sets Measurement BW to Auto.

`ON` or `1` sets Measurement BW to Manual.

Returns

0 means Measurement BW is set to Auto.

1 means Measurement BW is set to Manual.

Examples

`SENSe:P25:BAND:INT:AUTO?` might return `1`, indicating the Measurement BW is set to Auto.

[SENSe]:P25:FILTer:MEASurement

Sets or queries the P25 measurements Measurement Filter setting. The User Meas Filter selections are predefined user filters.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:FILTer:MEASurement{ OFF | USER1 | USER2 | USER3 | UOTH | RECT | RRC | RCOS | GAUS |
   HDQPSK_P25 | C4FM_P25}
[SENSe]:P25:FILTer:MEASurement?
```

Arguments

`OFF` sets the filter to None.

`USER1` sets the filter to User Meas Filter 1.

`USER2` sets the filter to User Meas Filter 2.

`USER3` sets the filter to User Meas Filter 3.

`UOTH` sets the filter to User other.

`RECT` sets the filter to Rectangular (only available for Phase 2 HDQPSK modulation type).

`RRC` sets the filter to Root Raised Cosine (only available for Phase 2 HDQPSK modulation type).

`RCOS` sets the filter to Raised Cosine (only available for Phase 2 HDQPSK modulation type).

`GAUS` sets the filter to Gaussian (only available for Phase 2 HDQPSK modulation type).

`HDQPSK_P25` sets the filter to HDQPSK-P25 (only available for Phase 2 HDQPSK modulation type)

`C4FM_P25` sets the filter to C4FM-P25 (only available for Phase 1 C4FM modulation type)

Returns

`OFF` means the filter is set to None.

`USER1` means the filter is set to User Meas Filter 1.

`USER2` means the filter is set to User Meas Filter 2.

`USER3` means the filter is set to User Meas Filter 3.

`UOTH` means the filter is set to User other.

`RECT` means the filter is set to Rectangular (only available for Phase 2 HDQPSK modulation type).

`RRC` means the filter is set to Root Raised Cosine (only available for Phase 2 HDQPSK modulation type).

RCOS means the filter is set to Raised Cosine (only available for Phase 2 HDQPSK modulation type).

GAUS means the filter is set to Gaussian (only available for Phase 2 HDQPSK modulation type).

HDQPSK_P25 means the filter is set to HDQPSK-P25 (only available for Phase 2 HDQPSK modulation type)

C4FM_P25 means the filter is set to C4FM-P25 (only available for Phase 1 C4FM modulation type)

Examples

SENSe:P25:FILTER:MEASUREMENT? might return USER1, indicating that the Measurement Filter is set to User Meas Filter 1.

[SENSe]:P25:FILTer:REFerence

Sets or queries the P25 measurements Reference Filter setting. The User Meas Filter selections are predefined user filters.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:FILTer:REFerence{ OFF | USER1 | USER2 | USER3 | UOTH | RECT | RRC | RCOS | GAUS |
   HDQPSK_P25| C4FM_P25}
[SENSe]:P25:FILTer:REFerence?
```

Arguments

OFF sets the filter to None.

USER1 sets the filter to User Meas Filter 1.

USER2 sets the filter to User Meas Filter 2.

USER3 sets the filter to User Meas Filter 3.

UOTH sets the filter to User other.

RECT sets the filter to Rectangular (only available for Phase 2 HDQPSK modulation type).

RRC sets the filter to Root Raised Cosine (only available for Phase 2 HDQPSK modulation type).

RCOS sets the filter to Raised Cosine (only available for Phase 2 HDQPSK modulation type).

GAUS sets the filter to Gaussian (only available for Phase 2 HDQPSK modulation type).

HDQPSK_P25 sets the filter to HDQPSK-P25 (only available for Phase 2 HDQPSK modulation type)

C4FM_P25 sets the filter to C4FM-P25 (only available for Phase 1 C4FM modulation type)

Returns

OFF means the filter is set to None.

USER1 means the filter is set to User Meas Filter 1.

USER2 means the filter is set to User Meas Filter 2.

USER3 means the filter is set to User Meas Filter 3. UOTH means the filter is set to User other.

RECT means the filter is set to Rectangular (only available for Phase 2 HDQPSK modulation type).

RCOS means the filter is set to Raised Cosine (only available for Phase 2 HDQPSK modulation type).

GAUS means the filter is set to Gaussian (only available for Phase 2 HDQPSK modulation type).

Examples

SENSe:P25:FILTER:REFERENCE? might return USER1, indicating that the Reference Filter is set to User Meas Filter 1.

[SENSe]:P25:FREQuency:ERRor

Sets or queries the P25 Frequency Offset (when Auto is off).

Conditions

Measurement view: Any P25 measurement display Frequency Offset set to manual (Auto off).

Group

Sense commands

Syntax

```
[SENSe]:P25:FREQuency:ERRor <NR2>
[SENSe]:P25:FREQuency:ERRor?
```

Related Commands

Arguments

<NR2> = a floating point value without an exponent, which is the fixed frequency offset in Hz.

Returns

<NR2> = a floating point value without an exponent, which is the fixed frequency offset in Hz.

Examples

SENSe:P25:FREQUENCY:ERROR? might return 749.9999390000, indicating that the frequency offset is 750.0 Hz.

SENSe:P25:FREQUENCY:ERROR 700.99 sets the frequency offset the 701.0 Hz.

[SENSe]:P25:FREQuency:ERRor:AUTO

Sets or queries if the P25 Frequency Error is set to Auto.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:FREQuency:ERRor:AUTO { 0 | 1 | OFF | ON }
[SENSe]:P25:FREQuency:ERRor:AUTO?
```

Arguments

OFF or 0 means the Auto is off.

ON or 1 means the Auto is on.

Returns

0 means that Auto is off.

1 means Auto is on.

Examples

`SENSe:P25:FREQUENCY:ERROR:AUTO?` might return `1`, indicating that the Frequency Error is set to Auto.

`SENSe:P25:FREQUENCY:ERROR:AUTO 0` turns off Auto setting for Frequency Error.

[SENSe]:P25:MODUlation:CHANnel:([BANDwidth]|:BWIDth)]? (Query Only)

Queries the actual P25 Preset channel bandwidth.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:MODUlation:CHANnel:([BANDwidth]|:BWIDth)]?
```

Returns

Bandwidth in kHz, using "_" to denote “.”. For example, 12_5 means 12.5 kHz.

Examples

`SENSe:P25:MODU:CHAN:BAND?` will return `12_5`, indicating that the channel bandwidth is 12.5 kHz.

[SENSe]:P25:MODUlation:STANdard

Sets or queries the P25 modulation standard.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:MODUlation:STANdard{PHASE1|PHASE2}
[SENSe]:P25:MODUlation:STANdard?
```

Related Commands

SENSe:P25:MODUlation:TYPE (on page 2281)

Arguments

`PHASE1` is the Phase 1 standard.

`PHASE2` is the Phase 2 standard.

Returns

PHASE1 is the Phase 1 standard.

PHASE2 is the Phase 2 standard.

Examples

`SENSe:P25:MODULATION:STANDARD?` might return `PHASE2`, indicating that the P25 modulation standard is set to Phase 2.

SENSe:P25:MODUlation:TYPE

Sets or queries the P25 modulation type.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
SENSe:P25:MODUlation:TYPE {C4FM|HCPM|HDQPSK}
SENSe:P25:MODUlation:TYPE?
```

Related Commands

[SENSe]:P25:MODUlation:STANdard (on page 2280)

Arguments

`C4FM`: this is a Phase 1 modulation standard type. Modulation Phase must be set to PHASE1.

`HCPM`: this is a Phase 2 modulation standard type. Modulation Phase must be set to PHASE2.

`HDQPSK`: this is a Phase 2 modulation standard type. Modulation Phase must be set to PHASE2.

Returns

C4FM: this is a Phase 1 modulation standard type.

HCPM: this is a Phase 2 modulation standard type.

HDQPSK: this is a Phase 2 modulation standard type.

Examples

`SENSe:P25:MODULATION:TYPE?` might return `HDQPSK`, indicating that the P25 modulation type is set to HDQPSK, which is a Phase 2 modulation standard.

[SENSe]:P25:SRATe

Sets or queries the Symbol Rate value for the P25 measurements.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:SRATe <value>
[SENSe]:P25:SRATe?
```

Arguments

<value> is the symbol rate value in kHz.

Returns

<NR3> = a floating point value with an exponent, which is the symbol rate value in kHz.

Examples

SENSe:P25:SRATE? might return 6.0000000000E+3, indicating that the symbol rate is 6 kHz.

[SENSe]:P25:SUMMary:CLEar:RESults (No Query Form)

Clears the results of the P25 Summary display.

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:CLEar:RESults
```

Arguments

None

Examples

SENSe:P25:SUMMARY:CLEAR:RESULTS clears the results in the P25 Summary display.

[SENSe]:P25:SUMMary:LIMIt:FA

Sets or queries for the On/Off state of limit comparison and the upper limit value for Operating Frequency Accuracy. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FA <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FA?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 4

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FA? might return "1,2" <1>, which indicates measurement is enabled (turned on) for limit comparison, and the upper limit for Operating Frequency Accuracy is 2.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEViation:AVERage:TERRor:ONE

Sets or queries for the On/Off state of limit comparison and the upper limit value for Average t_error_1. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEViation:AVERage:TERRor:ONE <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEViation:AVERage:TERRor:ONE?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 25

Returns

<NR1>,<NR3>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:AVERAGE:TERROR:ONE? might return "0,25.0000000000E-6",<0> indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Average t_error_1 is <25.0000000000E-6>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEViation:AVERage:TERRor:ZERO

Sets or queries for the On/Off state of limit comparison and the upper limit value for Average t_error_0. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEViation:AVERage:TERRor:ZERO <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEViation:AVERage:TERRor:ZERO?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 25

Returns

<NR1>,<NR3>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:AVERAGE:TERROR:ZERO? might return "0,25.0000000000E-6",<0> indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Average t_error_0 is <25.0000000000E-6>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:LOGIc:CHANnel:OFF:SLOT

Sets or queries for the On/Off state of limit comparison and the upper limit value for HCPM Transmitter Logic channel offslot. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:LOGIc:CHANnel:OFF:SLOT <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:LOGIc:CHANnel:OFF:SLOT?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to –57

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:LOGIC:CHANNEL:OFF:SLOT? might return "0,–57",<0>, which indicates measurement is disabled (turned off) for limit comparison, and the upper limit for HCPM Transmitter Logic channel offslot is <-57>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:LOGIc:CHANnel:PEAK:ACPR

Sets or queries for the On/Off state of limit comparison and the upper limit value for HCPM Transmitter Logic channel Peak ACPR. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:LOGIc:CHANnel:PEAK:ACPR <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:LOGIc:CHANnel:PEAK:ACPR?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 35

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:LOGIC:CHANNEL:PEAK:ACPR? might return "0,35",<0> indicating measurement is disabled (turned off) for limit comparison, and the upper limit for HCPM Transmitter Logic channel Peak ACPR is <35>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:NEGAtive:LO

Sets or queries for the On/Off state of limit comparison and the lower limit value for Frequency Deviation, negative peak. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:NEGAtive:LO <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:NEGAtive:LO?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 2544

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PEAK:NEGATIVE:LO? might return "1,2544",<1> indicates measurement is enabled (turned on) for limit comparison, and the lower limit for Frequency Deviation, negative peak, is <2544>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:NEGAtive:UP

Sets or queries for the On/Off state of limit comparison and the upper limit value for Frequency Deviation, negative peak. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:NEGAtive: UP <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:NEGAtive: UP?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 3111

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PEAK:NEGATIVE:UP? might return "1,3111", which indicates measurement is enabled (turned on) for limit comparison, and the upper limit for Frequency Deviation, negative peak, is <3111>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:POSItive:LO

Sets or queries for the On/Off state of limit comparison and the lower limit value for Frequency Deviation, positive peak. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:POSItive:LO <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:POSItive:LO?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 2544

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PEAK:POSITIVE:LO? might return "1,2544", which indicates measurement is enabled (turned on) for limit comparison and the lower limit for Frequency Deviation, positive peak, is <2544>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:POSItive:UP

Sets or queries for the On/Off state of limit comparison and the upper limit value for Frequency Deviation, positive peak. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:POSItive:UP <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PEAK:POSItive:UP?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 3111 Hz

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PEAK:POSITIVE:UP? might return "1,3111" which indicates measurement is enabled (turned on) for limit comparison, and the upper limit for Frequency Deviation, positive peak, is <3111>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:LO

Sets or queries for the On/Off state of limit comparison and the lower limit value for Frequency Deviation, f1/f2/f3/f4 for Phase1 or Phase2. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:LO <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:LO?
```

Arguments

<NR1> =0 to deselect the measurement and 1 to select the measurement.

<NR2> =0 to 2544

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PHASE[1/2]:F[1/2/3/4]:LO? might return "1,2544", indicating measurement is enabled (turned on) for limit comparison, and the upper limit for Frequency Deviation is <2544>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:LO

Sets or queries for two values namely, the On/Off state of limit comparison and the lower limit value for Frequency deviation, f1/f2/f3/f4 for Phase1 or Phase2. The limit comparison can be enabled (turned On) or disabled (turned off).

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]: F[1/2/3/4]:LO <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]: F[1/2/3/4]:LO?
```

Arguments

<Integer, Integer>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PHASE[1/2]:F[1/2/3/4]:LO? returns "1,2544", Indicating the measurement is enabled for limit comparison and the lower limit for Frequency deviation is <2544>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:UP

Sets or queries for the On/Off state of limit comparison and the upper limit value for Frequency Deviation, f1/f2/f3/f4 for Phase1 or Phase2. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:UP <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:UP?
```

Arguments

<NR1> =0 to deselect the measurement and 1 to select the measurement.

<NR2> =0 to 3111

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PHASE[1/2]:F[1/2/3/4]:UP? might return "1,3111", indicating measurement is enabled (turned on) for limit comparison, and the upper limit for Frequency Deviation is 3111.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:UP

Sets or queries for two values namely, the On/Off state of limit comparison and the upper limit value for Frequency deviation, f1/f2/f3/f4 for Phase1 or Phase2. The limit comparison can be enabled (turned On) or disabled (turned off).

Conditions

Measurement views: P25 Summary

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]: F[1/2/3/4]:UP <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PHASe[1/2]:F[1/2/3/4]:UP?
```

Arguments

<Integer, Integer>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PHASE[1/2]:F[1/2/3/4]:UP? returns “1,3111 “ Indicating the measurement is enabled for limit comparison and the upper limit for Frequency deviation is <3111>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:OFF

Sets or queries for the On/Off state of limit comparison and the upper limit value for Pmax-off. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:OFF <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:OFF?
```

Arguments

<NR1> =0 to deselect the measurement and 1 to select the measurement.

<NR2> =0 to 4

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PMAX:OFF? might return "0,4" <0>, indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Pmax-off is <4>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:OFF

Sets or queries for two values namely, the On/Off state of limit comparison and the upper limit value for Pmax-off. The limit comparison can be enabled (turned On) or disabled (turned off).

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:OFF <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:OFF?
```

Arguments

<Integer, Integer>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PMAX:OFF? returns "0,4", which indicates Measurement is disabled (turned Off) for limit comparison, and the upper limit for Pmax-off is <4>.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:ON

Sets or queries for the On/Off state of limit comparison and the upper limit value for Pmax-on. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:ON <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:ON?
```

Arguments

<NR1> =0 to deselect the measurement and 1 to select the measurement.

<NR2> =0 to 4

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PMAX:ON? might return "0,4", indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Pmax-on is 4.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:ON

Sets or queries for two values namely, the On/Off state of limit comparison and the upper limit value for Pmax-on. The limit comparison can be enabled (turned On) or disabled (turned off).

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:ON<NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:ON?
```

Arguments

<Integer, Integer>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PMAX:ON? returns "0,4", which indicates Measurement is disabled (turned Off) for limit comparison, and the upper limit for Pmax-on is 4.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:SS

Sets or queries for the On/Off state of limit comparison and the upper limit value for Pss-max. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:SS <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMAX:SS?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 1

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PMAX:SS? might return "0,1", indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Pss-max is 1.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMIN:SS

Sets or queries for the On/Off state of limit comparison and the upper limit value for Pss-min. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMIN:SS <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:PMIN:SS?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to -3

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:PMIN:SS? might return "0,-3", indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Pss-min is -3.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter:AVERage:ATTK:ENCOder

Sets or queries for the On/Off state of limit comparison and the upper limit value for Transmitter Average Attack encoder. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:ENCOder <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:ENCOder?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 100

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:TRANSMITTER:AVERAGE:ATTK:ENCODER? might return "0,100", indicating measurement is disabled (turned off) for limit comparison, and the upper limit for Transmitter Average Attack encoder is 100.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter:AVERage:ATTK:ENCOder:BI

Sets or queries for the On/Off state of limit comparison and the upper limit value for Transmitter Average Attack encoder, busy/idle. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:ENCOder:BI <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:ENCOder:BI?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 30

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:TRANSMITTER:AVERAGE:ATTK:ENCODER:BI? might return "0,30", which indicates measurement is disabled (turned off) for limit comparison and the upper limit for Transmitter Average Attack encoder, busy/idle, is 30.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter:AVERage:ATTK:POWEr

Sets or queries for the On/Off state of limit comparison and the upper limit value for Transmitter Average Attack power. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:POWEr <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:POWEr?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 50

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:TRANSMITTER:AVERAGE:ATTK:POWER? might return "0,50", which indicates measurement is disabled (turned off) for limit comparison and the upper limit for Transmitter Average Attack power is 50.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter:AVERage:ATTK:POWEr:BI

Sets or queries for the On/Off state of limit comparison and the upper limit value for Transmitter Average Attack power, busy/idle. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:POWEr:BI <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:ATTK:POWEr:BI?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 30

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:TRANSMITTER:AVERAGE:ATTK:POWER:BI? might return "0,30", which indicates measurement is disabled (turned off) for limit comparison, and the upper limit for Transmitter Average Attack power, busy/idle, is 30.

[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter:AVERage:THRUput:DLAY

Sets or queries for the On/Off state of limit comparison and the upper limit value for Transmitter Average throughput delay. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:THRUput:DLAY <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:FREQuency:DEVIation:TRANsmitter: AVERage:THRUput:DLAY?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 125

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:FREQUENCY:DEVIATION:TRANSMITTER:AVERAGE:THRUPUT:DLAY? might return "0,125", which indicates measurement is disabled (turned off) for limit comparison, and the upper limit for Transmitter Average throughput delay is 125.

[SENSe]:P25:SUMMary:LIMIt:MF

Sets or queries for the On/Off state of limit comparison and the upper limit value for Modulation Fidelity. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:MF <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:MF?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 4

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:MF? might return "1,4", which indicates measurement is enabled (turned on) for limit comparison, and the upper limit for Modulation Fidelity is 4.

[SENSe]:P25:SUMMary:LIMIt:RF:OUTPower

Sets or queries for the On/Off state of limit comparison and the upper limit value for RF Output Power. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:RF:OUTPower <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:RF:OUTPower?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 3

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:RF:OUTPOWER? might return "1,3", which indicates measurement is enabled (turned on) for limit comparison, and the upper limit for RF Output Power is 3.

[SENSe]:P25:SUMMary:LIMIt:SRA

Sets or queries for the On/Off state of limit comparison and the upper limit value for Symbol Rate Accuracy. The limit comparison can be enabled (turned on) or disabled (turned off).

Conditions

Measurement view: P25 Summary

Group

Sense commands

Syntax

```
[SENSe]:P25:SUMMary:LIMIt:SRA <NR1>,<NR2>
[SENSe]:P25:SUMMary:LIMIt:SRA?
```

Arguments

<NR1> = 0 to deselect the measurement and 1 to select the measurement.

<NR2> = 0 to 10

Returns

<NR1>,<NR2>

Examples

SENSe:P25:SUMMARY:LIMIT:SRA? might return "1,10", which indicates measurement is enabled (turned on) for limit comparison and the upper limit for Symbol Rate Accuracy is 10.

[SENSe]:P25:SYMBols:POINts

Sets or queries the Points/Symbols to display in the P25 measurement view.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:SYMBols:POINts{ONE|TWO|FOUR|EIGHt}
[SENSe]:P25:SYMBols:POINts?
```

Arguments

ONE set the Points/Symbol trace setting to 1.

TWO set the Points/Symbol trace setting to 2.

FOUR set the Points/Symbol trace setting to 4.

EIGHt set the Points/Symbol trace setting to 8.

Returns

ONE means the Points/Symbol trace setting is set to 1.

TWO means the Points/Symbol trace setting is set to 2.

FOUR means the Points/Symbol trace setting to is set 4.

EIGH means the Points/Symbol trace setting to is set 8.

Examples

SENSe:P25:SYMBOLS:POINTS? might return FOUR, indicating that the Points/Symbol value is set to 4.

[SENSe]:P25:TEST:PATTern

Sets or returns the test pattern type in the P25 displays.

Conditions

Measurement views: Any Bluetooth display

Group

Sense commands

Syntax

```
[SENSe]:P25:TEST:PATTern{LDEViation|HDEViation|TPOTHER}
[SENSe]:P25:TEST:PATTern?
```

Arguments

`LDEViation` indicates the low deviation test pattern.

`HDEViation` indicates the high deviation test pattern.

`TPOTHER` indicates a user defined test pattern.

Examples

`SENSe:P25:TEST:PATTERN?` might return `LDEV`, indicating the selected test pattern type is the low deviation type.

[SENSe]:P25:TIMe:UNITs

Sets or queries the fundamental unit of time for the P25 measurements.

Conditions

Measurement view: Any P25 measurement display

Group

Sense commands

Syntax

```
[SENSe]:P25:TIMe:UNITs{SEC|SYMB}
[SENSe]:P25:TIMe:UNITs?
```

Arguments

`SEConds` sets the unit of time to seconds.

`SYMBols` sets the unit of time to symbols.

Returns

`SEC` means that the unit if time is set to seconds.

`SYMB` means that the unit if time is set to symbols.

Examples

`SENSe:P25:TIME:UNITS?` might return `SEC`, indicating that the unit of time is set to seconds.

[SENSe]:P25:TRIGgger:MEASurement

Sets or queries the Trigger Measurement from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:TRIGgger:MEASurement <arg1>
[SENSe]:P25:TRIGgger:MEASurement?
```

Arguments

TATOBSYNC is the Time Alignment (tOB_sync measurement).

TAERR0 is the Time Alignment (t_error_0_calculation).

TAERR1 is the Time Alignment (t_error_1_calculation).

TIMEASNONE is None.

Returns

See Arguments

Examples

SENSe:P25:TRIGGGER:MEASUREMENT TATOBSYNC selects the Time Alignment (tOB_sync measurement) option when Modulation Params Standard is Phase2 and Modulation Type is C4FM.

[SENSe]:P25:TRIGgger:MEASurement:TOBSync

Sets or returns the tOB_sync (measured) value in the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:TRIGgger:MEASurement:TOBSync <value>
```

Arguments

None

Examples

SENSe:P25:TRIGGGER:MEASUREMENT:TOBSYNC? might return 6.00000000, which is the tOB_sync(measured) value.

[SENSe]:P25:TRIGgger:MEASurement:TOBSync:AUTO

Sets or queries the Auto checkbox selection from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:TRIGgger:MEASurement:TOBSync:AUTO <value>
```

Arguments

0 clears the checkbox.

1 checks the checkbox.

Returns

0 or 1, **<NRf>**

Examples

`SENSe:P25:TRIGGGER:MEASUREMENT:TOBSYNC:AUTO 1` enables the Auto checkbox in Trig Meas tab.

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour

Sets or queries the Trigger Measurements option Phase1-Transient Frequency Behavior from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour {RISE|FALL}
```

Arguments

`RISE` sets the Transient Frequency Behavior to Off to On.

`FALL` sets the Transient Frequency Behavior to On to Off.

Returns

RISE means the Transient Frequency Behavior is Off to On.

FALL means the Transient Frequency Behavior is On to Off.

Examples

`SENSe:P25:TRIGGGER:MEASUREMENT:TRANSIENT:FREQUENCY:BEHAVIOUR?` might return `RISE` if the Transient Frequency behavior Off to On option is chosen in the Transient Frequency.

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:OFF

Sets or queries the ‘t off’ value when the Transient Frequency option is Transient Frequency Behavior On to Off for Phase1-Transient Frequency Behavior from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

```
[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency: BEHAviour:TIME:OFF <arg1>
[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:OFF?
```

Arguments

`<arg1>`

Returns

<arg1>::<NRf>

Examples

SENSe:P25:TRIGGGER:MEASUREMENT:TRANSIENT:FREQUENCY:BEHAVIOUR:TIME:OFF 2 sets the "t off" value to 2.

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:OFF:AUTO

Sets or queries the Auto checkbox selection when Transient Frequency is chosen as Transient Frequency Behavior On to Off from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency: BEHAviour:TIME:OFF:AUTO <value>

Arguments

0 unchecks the checkbox.

1 checks the checkbox.

Returns

0 or 1, <NRf>

Examples

SENSe:P25:TRIGGGER:MEASUREMENT:TRANSIENT:FREQUENCY:BEHAVIOUR:TIME:OFF:AUTO 1 enables the Auto checkbox in Trig measurement tab.

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:ON

Sets or queries the ‘t on’ value when the Transient Frequency option is Transient Frequency Behavior Off to On for Phase1-Transient Frequency Behavior from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:ON <arg1>
[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:ON?

Arguments

<arg1>

Examples

SENSe:P25:TRIGGGER:MEASUREMENT:TRANSIENT:FREQUENCY:BEHAVIOUR:TIME:ON 2 sets the "t on" value to 2.

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency:BEHAviour:TIME:ON:AUTO

Sets or queries the Auto checkbox selection when Transient Frequency is chosen as Transient Frequency behavior Off to On from the P25 displays.

Conditions

Measurement views: P25 displays

Group

Sense commands

Syntax

[SENSe]:P25:TRIGgger:MEASurement:TRANsient:FREQuency: BEHAviour:TIME:ON:AUTO <value>

Arguments

0 unchecks the checkbox.

1 checks the checkbox.

Returns

0 or 1, <NRf>

Examples

SENSe:P25:TRIGGGER:MEASUREMENT:TRANSIENT:FREQUENCY:BEHAVIOUR:TIME:ON:AUTO 1 enables the Auto checkbox in Trig measurement tab.

[SENSe]:PERRor[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Phase error versus Time for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Sense commands

Syntax

[SENSe]:PERRor[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:PERRor[:MEASview<y>]:SELEcted:SOURce?

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

`SENSe:PERRor:MEASview1:SELEcted:SOURce?` queries the Source for Phase error versus Time Measurement View 1.

[SENSe]:PHVTime[:MEASview<y>]:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

`[SENSe]:PHVTime[:MEASview<y>]:CLEar:RESults`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

`SENSe:PHVTIME:MEASview1:CLEAR:RESULTS` restarts multi-trace functions.

[SENSe]:PHVTime[:MEASview<y>]:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: Phase versus Time.

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}
```

`[SENSe]:PHVTime[:MEASview<y>]:COLor?`

Arguments

The following table lists the arguments.

Argument	Description
`RED`	Red

Argument	Description
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray
TEMPerature	Temperature
SPECtral	Spectral

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

SENSE:PHVTIME:COLOR TEMPERATURE selects the temperature color palette.

[SENSe]:PHVTime[:MEASview<y>]:COLor:MAXimum

Sets or queries the maximum value of the color axis in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time.

Group

Sense commands

Syntax

[SENSe]:PHVTime[:MEASview<y>]:COLor:MAXimum <value>

[SENSe]:PHVTime[:MEASview<y>]:COLor:MAXimum?

Arguments

<value>::=<NRf> specifies the maximum value of the color axis.

Range: The minimum value to 100%.

The minimum value is set using the [SENSe]:PHVTime[:MEASview<y>]:COLor:MINimum command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

SENSE:PHVTIME:COLOR:MAXIMUM 90 sets the maximum value of the color axis to 90%.

[SENSe]:PHVTime[:MEASview<y>]:COLor:MINimum

Sets or queries the minimum value of the color axis in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time.

Group

Sense commands

Syntax

`[SENSe]:PHVTime[:MEASview<y>]:COLor:MINimum <value>`

`[SENSe]:PHVTime[:MEASview<y>]:COLor:MINimum?`

Arguments

`<value>::=<NRf>` specifies the minimum value of the color axis.

Range: 0% to the maximum value.

The maximum value is set using the `[SENSe]:PHVTime[:MEASview<y>]:COLor:MAXimum` command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:PHVTIME:COLOR:MINIMUM 10` sets the minimum value of the color axis to 10%.

[SENSe]:PHVTime[:MEASview<y>]:COLor:REVerse[:STATe]

Determines whether to reverse the color palette in the Phase versus Time view. When reversed, the highest density takes the color normally used for the lowest.

Conditions

Measurement views: Phase versus Time.

Group

Sense commands

Syntax

`[SENSe]:PHVTime[:MEASview<y>]:COLor:REVerse[:STATe] {OFF | ON | 0 | 1}`

`[SENSe]:PHVTime[:MEASview<y>]:COLor:REVerse[:STATe]?`

Arguments

`OFF` or `0` uses the color palette in its normal order.

`ON` or `1` reverses the color palette.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:PHVTIME:COLOR:REVERSE:STATE ON` reverses the color palette.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:CENTer

Sets or queries the center frequency in the Phase versus Time measurement.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:CENTer <value>
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:CENTer?
```

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STARt (on page 2307)

[SENSe]:PHVTime:MEASview<y>:FREQuency:STOP (on page 2309)

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<value>::<NRf>` specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:PHVTIME:MEASview1:FREQUENCY:CENTER 7.5GHz` sets the center frequency to 7.5 GHz.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:SPAN

Sets or queries the frequency span in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:SPAN <value>
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:SPAN?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the frequency span.

Range: 10 Hz to 40 MHz (Standard) / 110 MHz (Option 110)

Examples

SENSe:PHVTIME:MEASview1:FREQUENCY:SPAN 20MHz sets the span to 20 MHz.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:SPAN:LINK

Sets or queries the frequency span link in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:SPAN:LINK <value>
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:SPAN:LINK?
```

Arguments

OFF or 0 specifies that Link to Span is not checked.

ON or 1 specifies that Link to Span is checked .

Examples

SENSe:PHVTime:MEASview2:FREQuency:SPAN:LINK? might return 0 or 1 based on condition of Link to Span checkbox.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STARt

Sets or queries the measurement start frequency (left edge on the graph) in the Phase versus Time measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:PHVTime[:MEASview<y>]:FREQuency:CENTer command.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STARt <value>
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STARt?
```

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STOP (on page 2309)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the measurement start frequency.

Range: (center frequency) ± (span)/2.

Examples

SENSe:PHVTIME:MEASview1:FREQUENCY:START 6.95GHz sets the start frequency to 6.95 GHz.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP

Sets or queries the frequency step size (the amount per press by which the up or down key changes the setting value). Programming a specified step size sets [SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP:AUTO OFF.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP <value>
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP?
```

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP:AUTO (on page 2308)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

SENSe:PHVTIME:MEASview1:FREQUENCY:STEP 1.5kHz sets the step size to 1.5 kHz.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP:AUTO?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 specifies that the frequency step size is set manually using the [SENSe]:PHVTime[:MEASview<y>]:FREQuency:STEP command.

ON or 1 specifies that the frequency step size is set automatically.

Examples

SENSe:PHVTIME:MEASview1:BANDWIDTH:AUTO ON sets the frequency step size automatically.

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STOP

Sets or queries the measurement stop frequency (right edge of the graph) in the Phase versus Time measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:PHVTime[:MEASview<y>]:FREQuency:CENTer command.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STOP <value>
[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STOP?
```

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:FREQuency:STARt (on page 2307)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<value>::<NRf> is the measurement stop frequency.

Range: (center frequency) ± (span)/2.

Examples

SENSe:PHVTIME:MEASview1:FREQUENCY:STOP 7.05GHz sets the stop frequency to 7.05 GHz.

[SENSe]:PHVTime[:MEASview<y>]:MAXTracepoints

Sets or queries the maximum trace points in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:MAXTracepoints { ONEK | TENK | HUNDredk | NEVerdecimate }
[SENSe]:PHVTime[:MEASview<y>]:MAXTracepoints?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

ONEK sets the maximum trace points to 1 k.

TENK sets the maximum trace points to 10 k.

HUNDredk sets the maximum trace points to 100 k.

NEVerdecimate never decimates the trace points.

Examples

SENSe:PHVTIME:MEASview1:MAXTRACEPOINTS TENK sets the maximum trace points to 10 k.

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor

Sets or queries the ogram color scheme.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

```
[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow |
MAGenta | GRAY | TEMPerature | SPECtral}
[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor?
```

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MAXimum (on page 2311)

Arguments

The following table lists the arguments.

Argument	Description
RED	Red
GREen	Green
BLUe	Blue
CYAN	Cyan

Argument	Description
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray
TEMPerature	Temperature
SPECtral	Spectral

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

{RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}

Examples

SENSe:PHVTime:MEASview1:OGRAm:COLor TEMPerature selects the temperature color palette.

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MAXimum

Sets or queries the maximum value of the color axis in the ogram.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MAXimum <value>

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MAXimum?

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MINimum (on page 2312)

Arguments

<value>::=<NRf> specifies the maximum value of the color axis.

Range: -100 to +100 dBm.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

<NRf> specifies the maximum value of the color axis.

Examples

SENSe:PHVTime:MEASview1:OGRAm:COLor:MAXimum 10 sets the maximum value of the color axis to 10 dBm.

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MINimum

Sets or queries the minimum value of the color axis in the ogram.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MINimum <value>

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MINimum?

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:MAXimum (on page 2311)

Arguments

<value>::=<NRf> specifies the minimum value of the color axis.

Range: -100 to +100 dBm.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<NRf> specifies the minimum value of the color axis.

Examples

SENSe:PHVTime:MEASview1:OGRAm:COLor:MINimum 10 sets the minimum value of the color axis to 10 dBm.

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:REVerse

Sets or queries reverse color scheme state.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:REVerse {OFF | ON | 0 | 1}

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor:REVerse?

Related Commands

[SENSe]:PHVTime[:MEASview<y>]:OGRAm:COLor (on page 2310)

Arguments

`OFF` or `0` disables Reverse color scheme.

`ON` or `1` enables Reverse color scheme.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

`0` disables Reverse color scheme.

`1` enables Reverse color scheme.

Examples

`SENSe:PHVTime:MEASview1:OGRAm:COLor:REVerse OFF` disables reverse color scheme.

[SENSe]:PHVTime[:MEASview<y>]:PLOT

Sets or queries the Phase vs Time display mode.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

`[SENSe]:PHVTime[:MEASview<y>]:PLOT {TRACE | OGRAM | SPLIT}`

`[SENSe]:PHVTime[:MEASview<y>]:PLOT?`

Arguments

`TRACE` displays time plot.

`OGRAM` displays ogram plot.

`SPLIT` displays both ogram and time plots.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

`{TRACE | OGRAM | SPLIT}`

Examples

`SENSe:PHVTime:MEASview1:PLOT TRACE` sets plot type to TRACE (Time plot).

[SENSe]:PHVTime[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source with respect to the Phaseversus Time Measurement View nuumber

Conditions

Measurement views: Phase versus Time with specified Measurement view number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
SENSe:PHVTime[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
SENSe: PHVTime[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

SENSe:PHVTime:MEASview1:SELEcted:SOURce? queries or sets the Source for Phase versus Time Measurement View 1.

[SENSe]:PM:PHASe:OFFSet

Sets or queries the phase offset in the PM measurement.

Conditions

Measurement views: PM

Group

Sense commands

Syntax

```
[SENSe]:PM:PHASe:OFFSet <value>
[SENSe]:PM:PHASe:OFFSet?
```

Arguments

<value>::<NRf> specifies the phase offset. Range: –180 to +180 °.

Examples

SENSe:PM:PHASE:OFFSET 10deg sets the phase offset to 10 °.

[SENSe]:PM:PHASe:OFFSet:MARKer (No Query Form)

Sets the phase offset from the selected marker location in the PM measurement.

Conditions

Measurement views: PM

Group

Sense commands

Syntax

```
[SENSe]:PM:PHASe:OFFSet:MARKer
```

Arguments

None.

Examples

`SENSe:PM:PHASe:OFFSET:MARKER` sets the phase offset from the selected Marker position.

[SENSe]:PM:PHASe:SEARch:AUTO

Determines whether to detect the phase automatically or manually in the PM measurement.

Conditions

Measurement views: PM

Group

Sense commands

Syntax

```
[SENSe]:PM:PHASe:SEARch:AUTO { OFF | ON | 0 | 1 }
[SENSe]:PM:PHASe:SEARch:AUTO?
```

Arguments

`OFF` or `0` specifies that the phase offset is set manually using the command `[SENSe]:PM:PHASe:OFFSet`.

`ON` or `1` specifies that the phase is detected automatically.

Examples

`SENSe:PM:PHASE:SEARCH:AUTO ON` specifies that the phase is detected automatically.

[SENSe]:PNOise:AVERage:COUNt

Sets or queries the number of traces to combine for averaging in the phase noise measurement. This command is effective when `[SENSe]:PNOise:AVERage:ENABle` is set to ON.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:AVERage:COUNt <number>
[SENSe]:PNOise:AVERage:COUNt?
```

Arguments

`<number>::<NR1>` specifies the average count. Range: 2 to 10000.

Examples

`SENSe:PNOISE:AVERAGE:COUNT 64` sets the average count to 64.

[SENSe]:PNOise:AVERage:ENABle

Determines whether to enable averaging trace in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:AVERage:ENABle {OFF|ON|0|1}
[SENSe]:PNOise:AVERage:ENABle?
```

Arguments

`OFF` disables averaging trace.

`ON` enables averaging trace.

Examples

`SENSe:PNOISE:AVERAGE:ENABLE ON` enables averaging trace.

[SENSe]:PNOise:CARRier:FREQuency:TRACk

Determines whether to enable or disable tracking the carrier frequency in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:CARRier:FREQuency:TRACk {OFF|ON|0|1}
[SENSe]:PNOise:CARRier:FREQuency:TRACk?
```

Arguments

`OFF` or `0` disables tracking the carrier frequency.

`ON` or `1` enables tracking the carrier frequency.

Examples

`SENSe:PNOISE:CARRIER:FREQUENCY:TRACK ON` enables tracking the carrier frequency.

[SENSe]:PNOise:CARRier:THReshold

Sets or queries the threshold level to detect the carrier in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:CARRier:THReshold <value>
[SENSe]:PNOise:CARRier:THReshold?
```

Arguments

`<value>::<NRf>` specifies the threshold level above which the input signal is determined to be a carrier. Range: -60 to 0 dBm.

Examples

`SENSe:PNOISE:CARRIER:THRESHOLD -25` sets the carrier threshold level to –25 dB.

[SENSe]:PNOise:CLEar:RESults (No Query Form)

Restarts the average process, clearing average data and counter.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:CLEar:RESults
```

Arguments

None

Examples

`SENSe:PNOISE:CLEAR:RESULTS` restarts the average process.

[SENSe]:PNOise:FREQuency:INTegration:OFFSet:STARt

Sets or queries the start offset frequency for integration in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:FREQuency:INTegration:OFFSet:STARt <value>
[SENSe]:PNOise:FREQuency:INTegration:OFFSet:STARt?
```

Arguments

`<value>::<NRf>` specifies the start offset frequency for integration.

It must be less than the stop offset frequency. Range: 10 Hz to Stop Offset Frequency – 1 Hz.

Examples

`SENSe:PNOISE:FREQUENCY:INTEGRATION:OFFSET:START 100kHz` sets the start offset frequency for integration to 100 kHz.

[SENSe]:PNOise:FREQuency:INTegration:OFFSet:STOP

Sets or queries the stop offset frequency for integration in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:FREQuency:INTegration:OFFSet:STOP <value>
[SENSe]:PNOise:FREQuency:INTegration:OFFSet:STOP?
```

Arguments

`<value>::<NRf>` specifies the stop offset frequency for integration.

It must be greater than the start offset frequency. Range: 11 Hz to 1 GHz.

Examples

`SENSe:PNOISE:FREQUENCY:INTEGRATION:OFFSET:STOP 100MHz` sets the stop offset frequency for integration to 100 MHz.

[SENSe]:PNOise:FREQuency:PLOT:OFFSet:STARt

Sets or queries the start offset frequency for plotting the phase noise trace.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:FREQuency:PLOT:OFFSet:STARt <value>
[SENSe]:PNOise:FREQuency:PLOT:OFFSet:STARt?
```

Arguments

`<value>::<NRf>` specifies the start offset frequency for the trace plot.

It must be less than the stop offset frequency. Range: 10 Hz to 100 MHz in a tenfold sequence.

Examples

`SENSe:PNOISE:FREQUENCY:PLOT:OFFSET:START 100kHz` sets the start offset frequency for plot to 100 kHz.

[SENSe]:PNOise:FREQuency:PLOT:OFFSet:STOP

Sets or queries the stop offset frequency for plotting the phase noise trace.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

```
[SENSe]:PNOise:FREQuency:PLOT:OFFSet:STOP <value>
[SENSe]:PNOise:FREQuency:PLOT:OFFSet:STOP?
```

Arguments

`<value>::<NRf>` specifies the stop offset frequency for plot.

It must be greater than the start offset frequency. Range: 100 Hz to 1 GHz in a tenfold sequence.

Examples

`SENSe:PNOISE:FREQUENCY:PLOT:OFFSET:STOP 100MHz` sets the stop offset frequency for plot to 100 MHz.

[SENSe]:PNOise:OPTimization

Sets or queries the method of optimizing the gain and input bandwidth in the phase noise measurement.

Conditions

Measurement views: Phase noise

Group

Sense commands

Syntax

[SENSe]:PNOise:OPTimization { DRANge | SPEed }

[SENSe]:PNOise:OPTimization?

Arguments

`DRANge` optimizes the gain and input bandwidth to maximize the dynamic range.

`SPEed` optimizes the gain and input bandwidth to speed the measurement.

Examples

`SENSe:PNOISE:OPTIMIZATION DRANge` optimizes the gain and input bandwidth to maximize the dynamic range.

[SENSe]:POWer:UNITs

Sets or queries the fundamental unit of power.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:POWer:UNITs {DBM|DBV|VOLTs|WATTs|DBUW|DBW|DBUV|DBMV|DBUA|DBUV_M|DBUA_M| AMPS}
```

```
[SENSe]:POWer:UNITs?
```

Arguments

The following table lists the arguments.

Power units

Argument	Power unit
DBM	dBm
DBV	dBV
VOLTs	Volts
WATTs	Watts
DBUW	dBµW
DBW	dBW
DBUV	dBµV
DBMV	dBmV
DBUA	dBµA
DBUV_M	dBµV/m
DBUA_M	dBµA/m
AMPS	Amps

NOTE: Select dBµV/m or dBµA/m unit when using an antenna table.

Examples

`SENSe:POWer:UNITs DBM` specifies the fundamental unit of power as dBm.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:ALENgth

Sets or queries the absolute amount of time included in the Frequency-Domain Linearity type measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:ALENgth <value>
```

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:ALENgth?

Arguments

<value>::<NRf> specifies the absolute time in seconds for the measurement time.

Range: 1 ns to 100 seconds

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

[SENSE]:PULSE:MEASview2:ANALYZE:FDOMAIN:MEASUREMENT:TIME:ALENGTH 1E-6 sets the measurement time to 1 µs.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:METHod

Sets or queries the measurement time method for the Frequency-Domain Linearity type measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:METHod { ABSolute | RELative }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:METHod?

Arguments

ABSolute specifies the absolute time in seconds based on rising edge of the pulse.

RELative specifies the relative time in percent based on the pulse width and the center of the pulse.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:ANALyze:FDOMain:MEASurement:TIME:METHod REL sets the time method to Relative.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:RLENgth

Sets or queries the relative amount of time included in the Frequency-Domain Linearity type measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:RLENgth <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:RLENgth?
```

Arguments

`<value>::<NRf>` specifies the relative time in percent for the measurement time based on the pulse width and centered of the pulse.

Range: 10% to 100%

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:FDOMain:MEASurement:TIME:RLENgth 70` sets the measurement time to 70% of the pulse width.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:RLEVel

Sets or queries the measurement reference level for Frequency-Domain Linearity measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:RLEVel <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:RLEVel?
```

Arguments

`<value>::<NRf>` specifies the reference level in percentage as the location on the voltage straight-line approximation of the pulse rising edge.

Range: 50% to 100%

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:FDOMain:MEASurement:TIME:RLEVel 60` sets the reference level to 60% of the rising edge.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:STARt

Sets or queries the start time for the Frequency-Domain Linearity type measurements. The start time is the amount of time wait after the rising-edge reference before starting to measure.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:STARt <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:FDOMain:MEASurement:TIME:STARt?
```

Arguments

`<value>::<NRf>` specifies the start time in seconds from the reference level of the rising edge of the pulse.

Range: –100 ms to 100 ms

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:FDOMain:MEASurement:TIME:STARt 1E-6` sets the start time to 1 µs.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:CORRection:AMPLitude[:STATe]

Enables or disables the corrections for window and for delay of the highest side lobe in the Pulse Impulse Response measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:CORRection:AMPLitude[:STATe] { OFF | ON | 0 | 1 }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:CORRection:AMPLitude[:STATe]?
```

Arguments

OFF or 0 disables amplitude correction in Impulse Response measurements.

ON or 1 enables amplitude correction in Impulse Response measurements.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:ANALyze:IRESponse:CORRection:AMPLitude:STATe 1 enables amplitude correction.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:KOTime

Sets or queries the Keep-out time in the Pulse Impulse Response measurements. This specifies the width of time around the main lobe that lobes within this time zone are not eligible to be the “highest side lobe.”

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:KOTime <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:KOTime?
```

Arguments

<value>::<NRf> specifies the Keep-out time in seconds.

Range: 0 to 100 seconds.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:ANALyze:IRESponse:KOTime 0.001 sets the keep-out time to 1 ms.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:ALENgth

Sets or queries the absolute amount of time included in the Impulse Response type measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:ALENgth <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:ALENgth?
```

Arguments

`<value>::<NRf>` specifies the absolute time in seconds for the measurement time.

Range: 1 ns to 100 seconds.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSE:PULSE:MEASview2:ANALYZE:IRESPONSE:MEASUREMENT:TIME:ALEN 1E-6` sets the measurement time to 1 µs.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME: METHod

Sets or queries the measurement time method for the Impulse Response type measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:METHod { ABSolute | RELative }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:METHod?
```

Arguments

`ABSolute` specifies the absolute time in seconds based on rising edge of the pulse.

`RELative` specifies the relative time in percent based on the pulse width and the center of the pulse.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSE:PULSE:MEASview2:ANALYZE:IRESPONSE:MEASUREMENT:TIME:METHOD REL` sets the time method to Relative.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:RLENgth

Sets or queries the relative amount of time included in the Impulse Response type measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:RLENgth <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:RLENgth?
```

Arguments

`<value>::<NRf>` specifies the relative time in percent for the measurement time based on the pulse width and centered of the pulse.

Range: 10% to 100%.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSE:PULSE:MEASview2:ANALYZE:IRESPONSE:MEASUREMENT:TIME:RLENGTH 70` sets the measurement time to 70% of the pulse width.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME: RLEVel

Sets or queries the measurement reference level for Impulse Response measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:RLEVel <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:RLEVel?
```

Arguments

`<value>::<NRf>` specifies the reference level in percentage as the location on the voltage straight-line approximation of the pulse rising edge.

Range: 50% to 100%.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSE:PULSE:MEASview2:ANALYZE:IRESPONSE:MEASUREMENT:TIME:RLEVEL 60 sets the reference level to 60% of the rising edge.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:STARt

Sets or queries the start time for the Impulse Response type measurements. The start time is the amount of time wait after the rising-edge reference before starting to measure.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:STARt <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:IRESponse:MEASurement:TIME:STARt?
```

Arguments

<value>::<NRf> specifies the start time in seconds from the reference level of the rising edge of the pulse.

Range: −100 ms to 100 ms.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSE:PULSE:MEASview2:ANALYZE:IRESPONSE:MEASUREMENT:TIME:START 1E-6 sets the start time to 1 µs.

[SENSe]:PULSe[:MEASview<y>]:ANALyze: LEVel

Sets or queries how to determine the 50% level for the pulsed RF measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel { VOLTage | POWer }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel?
```

Arguments

`VOLTage` uses −6 dB to determine the 50% level.

`POWer` uses −3 dB to determine the 50% level.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:LEVel POWer` sets RF measurements to use −3 dB to determine the 50% level.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel:FIFTy

Sets or queries how to determine the 50% level for the pulsed RF measurements. This command is equivalent to the `[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel` command.

Conditions

Measurement views: Pulse statistics, Pulse table, Pulse trace

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel:FIFTy { VOLTage | POWer }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel:FIFTy?
```

Arguments

`VOLTage` uses −6 dB to determine the 50% level.

`POWer` uses −3 dB to determine the 50% level.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Examples

`SENSe:PULSE:MEASview2:ANALYZE:LEVEL:FIFTY POWer` sets RF measurements to use -3 dB to determine the 50% level.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel:HUNDred

Sets or queries how to determine the 100% level in the pulsed RF measurements. This command is equivalent to the `[SENSe]:PULSe:ANALyze:LEVel` command.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel:HUNDred { AVERage | INDependent }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:LEVel:HUNDred?
```

Arguments

`AVERage` uses the average amplitude calculated for the pulse-on as the 100% reference to measure the rise and fall times.

`INDependent` uses the amplitudes at the beginning and end of the pulse-on as the 100% references to measure the rise and fall times, respectively

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:LEVel:HUNDRED AVERage` uses pulse average amplitude to set the 100% level.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:MEASurement:TIME:TYPE?

Sets or Queries the Measurement(s) parameter from the Control panel settings of Define tab which is common across the displays Pulse Statistics, Pulse Table, Pulse Trace, Pulse Cumulative Histogram, Pulse Cumulative Statistics.

Conditions

Measurement views: Pulse Statistics, Pulse Table, Pulse Trace, Pulse Cumulative Histogram, Pulse Cumulative Statistics

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:MEASurement:TIME:TYPE ?
```

Arguments

`<arg1> :: {FDL | IMPR | FPD | RIPP | OVER}` sets the control panel Measurement(s) parameter of define tab to Freq-domain Linearity or Impulse Response or F P2R Diff, F P2P Diff, Freq Abs, Phase P2R Diff, Phase P2P Diff or Ripple or Overshoot

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<string>`

Examples

`SENSe:PULSE:ANALYZE:MEASview1:MEASUREMENT:TIME:TYPE FDL` sets the control panel Measurement(s) parameter under Define tab to Freq-domain Linearity.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:MEASurement:TIME:TYPE

Sets or queries the Measurement(s) parameter for the Define tab of the Settings control panel, which is common across the Pulse Statistics, Pulse Table, Pulse Trace, Pulse Cumulative Histogram, and Pulse Cumulative Statistics displays.

Conditions

Measurement views: All Pulsed RF displays (except Pulse-Ogram)

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:MEASurement:TIME:TYPE { FDL | IMPR | FPD | RIPP | OVER }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:MEASurement:TIME:TYPE ?
```

Arguments

`FDL` is Freq-domain Linearity

`IMPR` is Impulse Response

`FPD` is F P2R Diff

`RIPP` is ripple

`OVER` is overshoot

Freq Abs, Phase P2R Diff, Phase P2P Diff

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<string>`

Examples

`SENSe:PULSE:MEASview1:ANALYZE:MEASUREMENT:TIME:TYPE FDL` sets the Measurement(s) parameter in the Define tab of the Settings control panel to Freq-domain Linearity.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:ALENgth

Sets or queries the absolute amount of time included in the Overshoot measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:ALENgth <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:ALENgth?
```

Arguments

<value>::<NRf> specifies the absolute time in seconds for the measurement time.

Range: 1 ns to 100 seconds

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

[SENSE]:PULSE:MEASview2:ANALYZE:OVERSHOOT:MEASUREMENT:TIME:ALENGTH 1E-6 sets the measurement time to 1 µs.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME: METHod

Sets or queries the measurement time method for the Overshoot measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:METHod { ABSolute | RELative }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:METHod?
```

Arguments

ABSolute specifies the absolute time in seconds based on rising edge of the pulse.

RELative specifies the relative time in percent based on the pulse width and the center of the pulse.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSE:PULSE:MEASview2:ANALYZE:OVERSHOOT:MEASUREMENT:TIME:METHOD REL sets Overshoot measurements to use the relative time method.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:RLENgth

Sets or queries the relative amount of time included in the Overshoot measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:RLENgth <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:RLENgth?
```

Arguments

`<value>::<NRf>` specifies the relative time in percent for the measurement time based on the pulse width and centered of the pulse.

Range: 0.01% to 100%.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSE:PULSE:MEASview2:ANALYZE:OVERSHOOT:MEASUREMENT:TIME:RLENGTH 70` sets the measurement time to 70% of the pulse width.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME: RLEVel

Sets or queries the measurement reference level for the Overshoot measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:RLEVel <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:RLEVel?
```

Arguments

`<value>::<NRf>` specifies the reference level in percentage as the location on the voltage straight-line approximation of the pulse rising edge.

Range: 50% to 100%.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

SENSE:PULSE:MEASview2:ANALYZE:OVERSHOOT:MEASUREMENT:TIME:RLEVEL 60 sets the reference level to 60% of the rising edge.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:STARt

Sets or queries the start time for the Overshoot measurements. The start time is the amount of time wait after the rising-edge reference before starting to measure.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:STARt <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:OVERshoot:MEASurement:TIME:STARt?
```

Arguments

<value>::<NRf> specifies the start time in seconds from the reference level of the rising edge of the pulse.

Range: –100 ms to 100 ms.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSE:PULSE:MEASview2:ANALYZE:OVERSHOOT:MEASUREMENT:TIME:START 1E-6 sets the start time to 1 µs to 60% of the rising edge.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:PMLocation

Sets or queries the phase measurement location (the position along the pulse tops where the phase is measured) in the pulse-pulse phase measurement.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:PMLocation <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:PMLocation?
```

Arguments

<value>::<NRf> specifies the pulse-pulse phase measurement location.

Range: 5 ns to 100 ms.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:ANALyze:PMLocation 1.5ms sets the phase measurement location to 1.5 ms.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:POINt:LOCation

Sets or queries the point location method in the pulsed RF measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:POINt:LOCation { AVERage | INDependent }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:POINt:LOCation?
```

Arguments

AVERage uses the average amplitude calculated for the pulse-on as the 100% reference to measure the rise and fall times.

INDependent uses the amplitudes at the beginning and end of the pulse-on as the 100% references to measure the rise and fall times, respectively.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

[SENSe]:PULSe:MEASview2:ANALyze:POINt:LOCation AVERage uses pulse average amplitude to locate points.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:RFALI

Sets or queries the threshold levels to measure the rise/fall time.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:RFALl { WIDE | NARRow }
[SENSe]:PULSe[:MEASview<y>]:ANALyze:RFALl?
```

Arguments

`WIDE` selects 10 - 90% to measure the rise/fall time.

`NARRow` selects 20 - 80% to measure the rise/fall time.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:RFALL WIDE` selects 10 - 90% to measure the rise/fall time.

[SENSe]:PULSe[:MEASview<y>]:ANALyze:RIPPle

Sets or queries the ripple portion of the pulse top (how much of the beginning and end of the pulse top to exclude from the ripple calculation).

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:ANALyze:RIPPle <value>
[SENSe]:PULSe[:MEASview<y>]:ANALyze:RIPPle?
```

Arguments

`<value>::<NRf>` specifies the ripple portion of the pulse top.

Range: 10 to 100% in 1% steps.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:ANALyze:RIPPle 30` sets the ripple portion to 30% of the pulse top.

[SENSe]:PULSe:CARRier:FREQuency? (Query Only)

Queries the carrier frequency.

Conditions

Measurement views: Pulse table

Group

Sense commands

Syntax

```
[SENSe]:PULSe:CARRier:FREQuency?
```

Related Commands

[SENSe]:PULSe:CARRier:OFFSet (on page 2336)

Arguments

None

Returns

<NRf> indicates the actual carrier frequency in Hz.

Examples

SENSe:PULSE:CARRIER:FREQUENCY? might return 2.7000001690E+9, indicating that the pulse carrier frequency is 2.700000169 GHz.

[SENSe]:PULSe[:MEASview<y>]:CARRier:OFFSet

Sets or queries the carrier frequency offset.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:CARRier:OFFSet <value>
[SENSe]:PULSe[:MEASview<y>]:CARRier:OFFSet?
```

Related Commands

[SENSe]:PULSe[:MEASview<y>:CARRier:FREQuency? (on page 2335)

Arguments

<value>::<NRf> specifies the carrier frequency offset.

Range: -50 kHz to +50 kHz.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

`SENSe:PULSe:MEASview2:CARRier:OFFSet 2.5kHz` sets the offset frequency to 2.5 kHz to the carrier.

[SENSe]:PULSe[:MEASview<y>]:CARRier:SEARch

Sets or queries how to detect the carrier in the pulsed RF measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:CARRier:SEARch { AUTO | MANual}
[SENSe]:PULSe[:MEASview<y>]:CARRier:SEARch?
```

Arguments

`AUTO` specifies that the carrier is detected automatically.

`MANual` specifies that the carrier frequency offset is set manually, using the `[SENSe]:PULSe:CARRier:OFFSet` command.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:CARRier:SEARch AUTO` specifies that the carrier is detected automatically.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:BIN:COUNt

Sets the Bins value in Histogram settings table in the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

```
[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:BIN:COUNt <arg1>
```

Arguments

`<arg1> <arg1> 100` sets the bin's value in the histogram settings table to 100 which is under Histogram Settings table in Pulse Cumulative Histogram control panel.

The parameter `<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf1>

Examples

SENSe:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:BIN:COUNT 100 sets the bin's value in the histogram table to 100.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:CLEar:RESults (Query Only)

Clears all scalar results in the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:CLEar:RESults

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Examples

SENSe:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:CLEAR:RESULTS clears the result in Cumulative Histogram display.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:MODE

Sets the Histogram settings mode to Auto or Manual in the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:MODE <arg1>

Arguments

<arg1> <arg1> AUTO or MAN sets the histogram settings mode to Auto or Manual which is under Histogram Settings table in Pulse Cumulative Histogram control panel.

Returns

<string>

Examples

SENSe:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:MODE AUTO sets the histogram settings mode to Auto.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:ORDinate (Query Only)

Sets or queries the Histogram readout in the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

```
SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:ORDinate <arg1>
SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:ORDinate?
```

Arguments

`<arg1>` `<arg1> COUN` or `PERC` sets the histogram readout to Count or % which is under Prefs tab in Pulse Cumulative Histogram control panel.

The parameter `<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<string>`

Examples

`SENSe:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:ORDINATE ORDINATE COUN` sets the histogram readout to Count.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLier:ORDinate

Sets the outlier readout in the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

```
SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:OUTLIER:ORDINATE <arg1>
```

Arguments

`<arg1>` `<arg1> COUN` or `PERC` sets the outlier readout to Count or % which is under Prefs tab in Pulse cumulative histogram control panel.

Returns

`<string>`

Examples

`SENSe:PULSE:CUMULATIVE:HISTOGRAM:OUTLIER:MEASview1:ORDINATE COUN` sets the outlier readout to Count.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:SETtings:APPly (No Query Form)

Applies the new settings to the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

`[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:SETtings:APPly`

Arguments

The parameter `<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Examples

`SENSe:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:SETTINGS:APPLY` applies new settings to the Cumulative Histogram display under Histogram Settings table in Pulse Cumulative Histogram control panel.

[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:XLIMit

Sets the Xlimit in Histogram settings table in the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Sense commands

Syntax

`[SENSe]:PULSe:CUMulative:HISTogram[:MEASview<y>]:XLIMit <arg1>,<arg2>,<arg3>,<arg4>`

Arguments arg1

arg1 can have one of the following result types:

`{ AVERage| PPOWer | ATX | WIDTh | RISE | FALL | RINTerval | RRATe | DUTPct | DUTRatio | RIPPle | RIPDb | DROop | DRODb | OVERshoot | OVEDb | PPPHase | PPFRequency | RMSFreqerror | MFReqerror | RMSPherror | MPHerror | FRDeviation | FDELta | PHDeviation | IRAMplitude | TIME | IRTime | PPPD | PPFD | FABS}`

arg2

`0` unchecks the box

`1` checks the box.

Where

<arg1> is the Pulse result type.

<arg2> is the active flag which enables the limit state ON.

<arg3> is the minimum value.

<arg4> is the maximum value.

Examples

SENSe:PULSE:CUMULATIVE:HISTOGRAM:MEASview1:XLIMIT AVG,0,10,65 sets the Pulse result type, Active flag, Minimum value and Maximum value in the histogram table.

SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:SELEcted:SOURce

Returns the Source number of specified Cumulative Histogram trace

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:SELEcted:SOURce {"Source 1" |"Source 2" |"Source 3"
    |"Source 4"}
SENSe:PULSe:CUMulative:HISTogram[:MEASview<y>]:SELEcted:SOURce? (QUERY)
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf> Source Number of the specified Spectrogram tace

Examples

SENSe:PULSe:CUMulative:HISTogram:MEASview1:SELEcted:SOURce? might return Source 2 for the trace of Cumulative Histogram measurement view 1.

[SENSe]:PULSe:CUMulative:STATistics[:MEASview<y>]:CLEar:RESults

Clears all scalar results in the Cumulative Statistics display.

Conditions

Measurement views: Pulse Cumulative Statistics

Group

Sense commands

Syntax

```
[SENSe]:PULSe:CUMulative:STATistics[:MEASview<y>]:CLEar:RESults
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Examples

`SENSe:PULSe:CUMulative:STATistics:MEASview1:CLEar:RESults` clears the result in Cumulative Statistics display.

[SENSe]:PULSe:CUMulative:STATistics[:MEASview<y>]:SELEcted:SOURce

Sets or queries the selected source for Pulse Cumulative statistics measurment.

Conditions

Measurement views: Pulse Cumulative Statistics

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:PULSe:CUMulative:STATistics[:MEASview<y>]:SELEcted:SOURce {"Source 1" |"Source 2" |"Source
   3" |"Source 4"}
[SENSe]:PULSe:CUMulative:STATistics[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

```
{"Source 1" | "Source 2" | "Source 3" | "Source 4"}
```

Examples

`SENSe:PULSe:CUMulative:STATistics:MEASview1:SELEcted:SOURce?` might return source `3`, which indicates the channel of measurement source for RF data type.

[SENSe]:PULSe[:MEASview<y>]:DETect:MEASurement

Determines whether or not to set the maximum number of pulses to measure within the analysis time.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:DETect:MEASurement { OFF | ON | 0 | 1 }
```

[SENSe]:PULSe[:MEASview<y>]:DETect:MEASurement?

Arguments

OFF or 0 measures all pulses (max. 1000) in the analysis time.

ON or 1 specifies that the maximum number of pulses is set manually, using the [SENSe]:PULSe:DETect:NUMBer command.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:DETect:MEASurement ON specifies that the maximum number of pulses is set manually.

[SENSe]:PULSe[:MEASview<y>]:DETect:NUMBer

Sets or queries the maximum number of pulses to measure within the analysis time when [SENSe]:PULSe:DETect:MEASurement is On.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

[SENSe]:PULSe[:MEASview<y>]:DETect:NUMBer <value>
[SENSe]:PULSe[:MEASview<y>]:DETect:NUMBer?

Arguments

<value>::<NRf> specifies the maximum number of pulses to measure within the analysis time. Range: 1 to 1000.

If the analysis time contains fewer pulses than this number, all of these are measured.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:DETect:NUMBer 850 sets the maximum number of pulses to 850.

[SENSe]:PULSe[:MEASview<y>]:DETect:NUMBer:THReshold

Sets or queries the power threshold to detect pulses.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:DETect:NUMBer:THReshold <value>
[SENSe]:PULSe[:MEASview<y>]:DETect:NUMBer:THReshold?
```

Arguments

`<value>::<NRf>` specifies the power threshold to detect pulses.

Range: -70 to 0 dB.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:DETect:NUMBer:THReshold -20` sets the power threshold to -20 dB.

[SENSe]:PULSe[:MEASview<y>]:DETect:TIMe[:THReshold]

Sets or queries the minimum off-time between pulses.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:DETect:TIMe[:THReshold] <value>
[SENSe]:PULSe[:MEASview<y>]:DETect:TIMe[:THReshold]?
```

Arguments

`<value>::<NRf>` specifies the minimum off-time between pulses.

Range: 1 ns to 100 ms.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:DETect:TIMe:THReshold 1.5ms` sets the time threshold to 1.5 ms.

[SENSe]:PULSe[:MEASview<y>]:FILTer:{BANDwidth|BWIDth}

[SENSe]:PULSe[:MEASview<y>]:FILTer:{BANDwidth | BWIDth}

Sets or queries the filter or acquisition bandwidth when `[SENSe]:PULSe:FILTer:MEASurement` is set to `GAUSsian` or `NONE` (No filter), respectively.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:FILTer:{BANDwidth|BWIDth} <value>
[SENSe]:PULSe[:MEASview<y>]:FILTer:{BANDwidth|BWIDth}?
```

Related Commands

[SENSe]:PULSe:FILTer:MEASurement (on page 2345)

Arguments

`<value>::<NRf>` specifies the filter/acquisition bandwidth depending the `[SENSe]:PULSe:FILTer:MEASurement` setting. The table below shows the setting range. You can enter any value, but it is rounded up to the next valid number.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

[SENSe]:PULSe:FILTer:MEASurement	Range
GAUSsian	100 Hz to 20 MHz (Standard) / 100 Hz to 55 MHz (Option 110) in 1-2-3-5 sequence.
NONE	152, 305, 610, 1.22 k, 2.44 k, 4.88 k, 9.76 k, 19.3 k, 39 k, 78 k, 156 k, 312 k, 625 k, 1.25 M, 2.5 M, 5 M, 10 M, 20 M, 40 MHz, and optionally 60 M and 110 MHz (Option 110).

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:FILTer:BANDwidth 10MHz` sets the filter bandwidth to 10 MHz.

[SENSe]:PULSe[:MEASview<y>]:FILTer:MEASurement

Sets or queries the measurement filter in the pulsed RF measurements.

Conditions

Measurement views: Pulse statistics, Pulse table, Pulse trace

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:FILTer:MEASurement { GAUSsian | NONE | MAXRtbw}
[SENSe]:PULSe[:MEASview<y>]:FILTer:MEASurement?
```

Related Commands

[SENSe]:PULSe[:MEASview<y>]:FILTer {BANDwidth|BWIDth} (on page 2345)

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

GAUSsian uses the Gaussian filter in the pulsed RF measurements. Use the [SENSe]:PULSe[:MEASview<y>]:FILTer:{BANDwidth|BWIDth} command to set the filter bandwidth.

NONE uses no filter. Use the [SENSe]:PULSe[:MEASview<y>]:FILTer:{BANDwidth|BWIDth} command to set the acquisition bandwidth.

MAXRtbw uses no filter. The acquisition bandwidth is fixed to the maximum real-time bandwidth: 40 MHz (Standard) or 110 MHz (Option 110).

Examples

SENSe:PULSE:MEASview1:FILTER:MEASUREMENT GAUSsian uses the Gaussian filter in the pulsed RF measurements.

[SENSe]:PULSe[:MEASview<y>]:FREFerence:AUTO

Determines whether to estimate the pulse frequency reference automatically or manually in the pulsed RF measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:FREFerence:AUTO { OFF | ON | 0 | 1 }
[SENSe]:PULSe[:MEASview<y>]:FREFerence:AUTO?
```

Arguments

OFF or 0 estimates the frequency reference manually. Use the [SENSe]:PULSe:FREFerence:OFFSet command to set the frequency offset.

ON or 1 estimates the frequency reference automatically.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe[:MEASview2:FREFerence:AUTO ON specifies that the maximum number of pulses is set manually.

[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope

Sets or queries the Chirp Slope.

Chirp Slope is used when the Modulation Type is set to Linear Chirp. When set, this also changes the Chirp Slope to manual mode. When chirp slope is in auto mode, the query returns the estimated chirp slope.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope <value>
[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope?
```

Arguments

`<value>`: = NRf specifies the chirp slope in Hz/µs.

Range: -100 GHz/µs to 100 GHz/µs.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:FREFerence:CSLope 1E6` sets the chirp slope to 1 MHz/µs.

[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope:AUTO

Sets or queries enabling automatic Chirp Slope estimating in the pulsed RF measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope:AUTO { OFF | ON | 0 | 1 }
[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope:AUTO?
```

Arguments

`OFF` or `0` estimates the chirp slope manually. Use the `[SENSe]:PULSe[:MEASview<y>]:FREFerence:CSLope` command to set the chirp slope.

`ON` or `1` estimates the chirp slope automatically.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:FREFerence:CSLope:AUTO ON sets the chirp slope to auto mode.

[SENSe]:PULSe[:MEASview<y>]:FREFerence:OFFSet

Sets or queries the frequency reference offset. This command is valid when [SENSe]:PULSe[:MEASview<y>]:FREFerence:AUTO is set to OFF.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:FREFerence:OFFSet <value>
[SENSe]:PULSe[:MEASview<y>]:FREFerence:OFFSet?
```

Arguments

<value>::<NRf> specifies the frequency reference offset.

Range: -50 kHz to +50 kHz.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:FREFerence:OFFSet 2.5kHz sets the frequency offset to 2.5 kHz to the reference.

[SENSe]:PULSe[:MEASview<y>]:MODulation:TYPE

Sets or queries the modulation type in the pulsed RF measurements. This command is equivalent to the [SENSe]:REANalyze:NEXT command.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:MODulation:TYPE { CWConst | CWCHange | LCHirp | OTHer}
[SENSe]:PULSe[:MEASview<y>]:MODulation:TYPE?
```

Arguments

`CWConst` selects the CW (continuous wave) with constant phase.

`CWCHange` selects the CW (continuous wave) with changing phase.

`LCHirp` selects the linear chirp.

`OTHer` selects other.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

`SENSe:PULSe:MEASview2:MODulation:TYPE CWCHang` selects the CW with changing phase as the modulation type.

[SENSe]:PULSe[:MEASview<y>]:STATistics:SELEcted:SOURce

Sets or queries selected source for pulse statistics measurement.

Conditions

Measurement views: Pulse Statistics

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:STATistics:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" |
   "Source 4" }
[SENSe]:PULSe[:MEASview<y>]:STATistics:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

`SENSe:PULSe:MEASview2:STATistics:SELEcted:SOURce?` queries the source of the Pulse Statistics Measurement View 2.

[SENSe]:PULSe:OGRAm[:MEASview<y>]: ANALysis:FVTime:FILTer:SHAPe

Sets or queries the type of Filter shape from Analysis tab of Frequency vs Time from the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Sense commands

Syntax

```
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:FILTer:SHAPe <arg1>
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:FILTer:SHAPe?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<arg1> is KAIS or UNIF or BH4B or FLAT or HAMM

Where

UNIF is Uniform (none).

BH4B is Blackman-Harris 4B.

FLAT is Flat - Top (CW ampl).

KAIS is Kaiser (RBW).

HAMM is Hamming.

Returns

<string> KAIS or UNIF or BH4B or FLAT or HAMM

Examples

SENSe:PULSe:OGRAm:MEASview1:ANALysis:FVTime:FILTer:SHAPe KAIS sets the Analysis Filter shape to Kaiser(RBW).

[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:SPECtrum:ANALysis:REGion

Sets or queries the Spectrum Analysis region from Analysis tab of Frequency vs Time in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Sense commands

Syntax

```
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:SPECtrum:ANALysis:REGion <arg1>
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:SPECtrum:ANALysis:REGion?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<arg1> is ATIM or POT or IND

Where

ATIM is Use Analysis Time settings.

POT is Pulse ON Time.

IND is Independent.

Returns

<string> ATIM or POT or IND

Examples

SENSe:PULSe:OGRAm:MEASview1:ANALysis:FVTime:SPECtrum:ANALysis:REGion ATIM sets the Spectrum Analysis region to Use Analysis Time settings option.

[SENSe]:PULSe:OGRAm[:MEASview<y>]:SELEcted:SOURce

Returns the Source number of specified pulso-gram trace.

Conditions

Measurement views: Pulse-Ogram

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:PULSe:OGRAm[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source
    4" }
[SENSe]:PULSe:OGRAm[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

{"Source 1" | "Source 2" | "Source 3" | "Source 4" }

Examples

SENSe:PULSe:OGRAm:MEASview1:SELEcted:SOURce? queries the source of the PulseOgram measurement view 1.

[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:ONTime:LENgth

Sets or queries the OnTime value from Analysis tab of Frequency vs Time in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Sense commands

Syntax

```
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:ONTime:LENgth <value>
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:ONTime:LENgth?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value> = <NRf>

Returns

<NRf> specifies the ON time in seconds.

Examples

SENSe:PULSe:OGRAm:MEASview<y>:ANALysis:FVTime:ONTime:LENgth? might return 10E-6s.

[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:INDependent:STARt

Sets or queries the independent spectrum start time from Analysis tab of Frequency vs Time in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Sense commands

Syntax

```
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:INDependent:STARt <value>
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:INDependent:STARt?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

<value> = <NRf>

Returns

<NRf> specifies the independent spectrum start time in seconds.

Examples

SENSe:PULSe:OGRAm:MEASview1:ANALysis:FVTime:INDependent:STARt? might return 10E-6s.

[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:INDependent:LENgth

Sets or queries the independent spectrum length from Analysis tab of Frequency vs Time in the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Sense commands

Syntax

```
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:INDependent:LENgth <value>
[SENSe]:PULSe:OGRAm[:MEASview<y>]:ANALysis:FVTime:INDependent:LENgth?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value> = <NRf>

Returns

<NRf> specifies the independent spectrum length in seconds.

Examples

SENSe:PULSe:OGRAm:MEASview1:ANALysis:FVTime:INDependent:LENgth? might return 10E-6s.

[SENSe]:PULSe[:MEASview<y>]:SIGNal:TYPE

Sets or queries the signal type in the pulsed RF measurements.

Conditions

Measurement views: Pulse Statistics with specified Measurement view number, Pulse table, Pulse trace with specified Measurement view number

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:SIGNal:TYPE { CWConst | CWCHange | LCHirp | OTHer}
[SENSe]:PULSe[:MEASview<y>]:SIGNal:TYPE?
```

Arguments

CWConst selects CW (continuous wave) with constant phase.

CWCHange selects CW (continuous wave) with changing phase.

LCHirp selects linear chirp.

OTHer selects other.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:SIGNal:TYPE CWCHange selects the CW with changing phase as the signal type.

[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:ORDinate

Sets or queries the Histogram Y unit. This command is valid when `DISPlay:PULSe:STATistics:PLOT` is set to Histogram.

Conditions

Measurement views: Pulse statistics

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:ORDinate { PERCent | COUNt }
[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:ORDinate?
```

Arguments

`PERCent` sets the Histogram plot Y axis to the percentage of points.

`COUNt` sets the Histogram plot Y axis to the number of points in the bin.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`SENSe:PULSe:MEASview2:STATistics:HISTogram:ORDinate PERCENT` sets the histogram Y axis to percent.

[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:POINts

Sets or queries the number of bins in the Histogram plot.

Conditions

Measurement views: Pulse statistics

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:POINts <value>
[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:POINts?
```

Arguments

`<value> ::= <NRf>` specifies the number of histogram bins.

Range: 5 to 10000

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

SENSe:PULSe:MEASview2:STATistics:HISTogram:POINts 10 sets the number of histogram bins to 10.

[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:POINts:AUTO

Sets or queries enabling automatic Histogram plot bins count.

Conditions

Measurement views: Pulse statistics

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:POINts:AUTO { OFF | ON | 0 | 1 }
[SENSe]:PULSe[:MEASview<y>]:STATistics:HISTogram:POINts:AUTO?
```

Arguments

OFF or 0 sets the number of bins manually by the [SENSe]:PULSe:STATistics:HISTogram:POINts command.

ON or 1 sets the number of bins to the number of pulses/10.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSe:MEASview2:STATistics:HISTogram:POINts:AUTO 1 sets the number of histogram bins based on number of pulses.

[SENSe]:PULSe[:MEASview<y>]:STATistics:IN:LINear:SCALe

Sets or queries the “Calculate statistics in linear scale” selection from the display.

Conditions

Measurement views: Pulse Cumulative Statistics, Pulse Statistics

Group

Sense commands

Syntax

```
[SENSe]:PULSe[:MEASview<y>]:STATistics:IN:LINear:SCALe { 0 | OFF | 1 | ON}
[SENSe]:PULSe[:MEASview<y>]:STATistics:IN:LINear:SCALe?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

0 or OFF unchecks the box and disables the calculate function

1 or ON checks the box and enables the calculate function

Returns

<Boolean>, 0 or 1

Examples

SENSe:PULSe:MEASview1:STATistics:IN:LINear:SCALe 1 enables the Calculate statistics in linear scale (for results in log).

[SENSe]:PULSe:TRACe[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of the selected Measurement view in pulse trace.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:PULSe:TRACe[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:PULSe:TRACe[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:PULSE:TRACE:MEASVIEW1:SELECTED:SOURCE? queries the source of the pulse trace measurement view 1.

[SENSe]:PULSe:RESult[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of the selected Measurement view in pulse Result.

Conditions

Measurement views: Pulse Result with specified Measurement view number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:PULSe:RESult[:MEASview<y>]:SELEcted:SOURce {"Source1"|"Source2"|"Source3"|"Source4"}
[SENSe]:PULSe:RESult[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y>=1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1

Examples

[SENSe]:PULSe:RESult[:MEASview1:SELEcted:SOURce? Queries the Source of the spectrum Measurement View 1.

[SENSe]:REANalyze (No Query Form)

Sets all measurements to reanalyze the last acquisition.

NOTE: hg is an overlapped command, which does not finish executing before the next command starts executing. Use the *OPC(?) and *WAI commands to synchronize all pending operations to the execution of this command.

Conditions

Measurement views: All

Group

Sense commands

Syntax

[SENSe]:REANalyze

Related Commands

*OPC (on page 1594)

*WAI (on page 2795)

Arguments

None

Examples

SENSe:REANALYZE reanalyzes all measurements using the current acquisition.

[SENSe]:REANalyze:ACQuisition:SETTings? (Query Only)

Queries the settings of all acquisitions.

Conditions

Measurement views: All

Group

Sense commands

Syntax

[SENSe]:REANalyze:ACQuisition:SETTings?

[SENSe]:REANalyze:ALL:LOOP (No Query Form)

Replay all selected records/frames in a continuous loop.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:ALL:LOOP
```

[SENSe]:REANalyze:CURRent (No Query Form)

Replay the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:CURRent
```

[SENSe]:REANalyze:CURRent:ACQuisition? (Query Only)

Queries the Acquisition record identifier (ID) of the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:CURRent:ACQuisition?
```

[SENSe]:REANalyze:CURRent:FRAMe? (Query Only)

Queries the Frame identifier (ID) of the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:CURRent:FRAMe?
```

[SENSe]:REANalyze:CURRent (No Query Form)

Replay the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:CURRent
```

[SENSe]:REANalyze:CURRent:TIMestamp? (Query Only)

Queries the time stamp of the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:CURRent:TIMestamp?
```

[SENSe]:REANalyze:DELete:DATA (No Query Form)

Deletes all acquisition data.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:DELete:DATA
```

[SENSe]:REANalyze:FIRSt (No Query Form)

Replays (reanalyzes) the first item in the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:FIRSt
```

[SENSe]:REANalyze:LAST (No Query Form)

Replays (reanalyzes) the last item in the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:LAST
```

[SENSe]:REANalyze:NEXT (No Query Form)

Replays (reanalyzes) the next item in the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:NEXT
```

[SENSe]:REANalyze:PAUSe

Sets or queries the reanalysis paused state.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:PAUSe {OFF | ON | 0 | 1 }
[SENSe]:REANalyze:PAUSe?
```

Arguments

`ON` or `1` pauses (blocks) any acquisition until current reanalysis is completed.

`OFF` or `0` disables the reanalysis pause mode.

[SENSe]:REANalyze:PREVious (No Query Form)

Replays (reanalyzes) the previous item in the currently selected acquisition (or frame).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:PREVious
```

[SENSe]:REANalyze:SELect:ACQuisition:DATA:TYPE

Sets or queries the acquisition data type.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:DATA:TYPE {SPECtra | IQ }
[SENSe]:REANalyze:SELect:ACQuisition:DATA:TYPE?
```

Arguments

`SPECtra` sets the acquisition data type as DPX spectra data.

`IQ` sets the acquisition date type a IQ data.

Examples

`SENSe:REANALYZE:SELECT:ACQUISITION:DATA:TYPE IQ` sets the acquisition data type to IQ data.

[SENSe]:REANalyze:SELect:ACQuisition:FIRSt? (Query Only)

Queries the first selectable acquisition Start or Stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:FIRSt?
```

Related Commands

[SENSe]:REANalyze:SELect:ACQuisition:FIRSt:TIMestamp? (on page 2361)

[SENSe]:REANalyze:SELect:ACQuisition:FIRSt:TIMestamp? (Query Only)

Queries the time stamp of the first selectable acquisition history Start or Stop value in the currently selected acquisition set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:FIRSt:TIMestamp?
```

Related Commands

[SENSe]:REANalyze:SELect:ACQuisition:FIRSt? (on page 2361)

[SENSe]:REANalyze:SELect:ACQuisition:LAST? (Query Only)

Queries the last selectable acquisition Start or Stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:LAST?
```

Related Commands

[SENSe]:REANalyze:SELect:ACQuisition:LAST:TIMestamp? (on page 2362)

[SENSe]:REANalyze:SELect:ACQuisition:LAST:TIMestamp? (Query Only)

Queries the time stamp of the last selectable acquisition Start or Stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:LAST:TIMestamp?
```

Related Commands

[SENSe]:REANalyze:SELect:ACQuisition:LAST? (on page 2362)

[SENSe]:REANalyze:SELect:ACQuisition:STARt

Sets or queries the Acquisition Start value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:STARt <value>
[SENSe]:REANalyze:SELect:ACQuisition:STARt?
```

Arguments

<value>::<NR1> is an integer in the range from one to the number of acquisitions in the acquisition history.

[SENSe]:REANalyze:SELect:ACQuisition:STARt:TIMestamp? (Query only)

Queries the time stamp of the current Acquisition Start selection. It is the time stamp of the first frame of the selected acquisition, if FastFrame is enabled.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:STARt:TIMestamp?
```

[SENSe]:REANalyze:SELect:ACQuisition:STOP

Sets or queries the Acquisition Stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:STOP <value>
[SENSe]:REANalyze:SELect:ACQuisition:STOP?
```

Arguments

<value>::<NR1> is an integer in the range from one to the number of acquisitions in the acquisition history.

[SENSe]:REANalyze:SELect:ACQuisition:STOP:TIMestamp? (Query Only)

Queries the time stamp of the current Acquisition Stop selection. This is the time stamp of the last frame of the selected acquisition, if FastFrame is enabled.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ACQuisition:STOP:TIMestamp?
```

[SENSe]:REANalyze:SELect:ALL (No Query Form)

Selects all acquisitions and frames in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:ALL
```

[SENSe]:REANalyze:SELect:FRAMe:FIRSt? (Query Only)

Queries the first available Frame Start or Stop value available in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:FIRSt?
```

Related Commands

[SENSe]:REANalyze:SELect:FRAMe:FIRSt:TIMestamp? (on page 2364)

[SENSe]:REANalyze:SELect:FRAMe:FIRSt:TIMestamp? (Query Only)

Queries the time stamp of the first available frame of the first available Acquisition Start or Stop value available in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:FIRSt:TIMestamp?
```

Related Commands

[SENSe]:REANalyze:SELect:FRAMe:FIRSt? (on page 2364)

[SENSe]:REANalyze:SELect:FRAMe:LAST? (Query Only)

Queries the last available Frame Start or Stop value available in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:LAST?
```

Related Commands

[SENSe]:REANalyze:SELect:FRAMe:LAST:TIMestamp? (on page 2365)

[SENSe]:REANalyze:SELect:FRAMe:LAST:TIMestamp? (Query Only)

Queries the time stamp of the last available frame of the last available Acquisition Start or Stop value available in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:LAST:TIMestamp?
```

Related Commands

[SENSe]:REANalyze:SELect:FRAMe:LAST? (on page 2365)

[SENSe]:REANalyze:SELect:FRAMe:STARt

Sets or queries the Frame Start value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:STARt <value>
[SENSe]:REANalyze:SELect:FRAMe:STARt?
```

Arguments

`<value>::<NR1>` is an integer in the range from one to the number of fast frames.

[SENSe]:REANalyze:SELect:FRAMe:STARt:TIMestamp? (Query Only)

Queries the time stamp of the current Frame Start selection. This is the time stamp of the Frame Start frame of the acquisition start acquisition, if FastFrame is enabled.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:STARt:TIMestamp?
```

[SENSe]:REANalyze:SELect:FRAMe:STOP

Sets or queries the frame stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:STOP <value>
[SENSe]:REANalyze:SELect:FRAMe:STOP?
```

Related Commands

[SENSe]:REANalyze:SELect:FRAMe:STOP:TIMestamp? (on page 2366)

Arguments

`<value>::<NR1>` is an integer in the range from one to the number of fast frames.

[SENSe]:REANalyze:SELect:FRAMe:STOP:TIMestamp? (Query Only)

Queries the time stamp of the current frame stop selection. It is the time stamp of the frame Stop frame of the Acquisition Stop acquisition if FastFrame is enabled.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:FRAMe:STOP:TIMestamp?
```

Related Commands

[SENSe]:REANalyze:SELect:FRAMe:STOP (on page 2366)

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:ALL (No Query Form)

Selects all spectra acquisitions and frames in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:ALL
```

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:CURRent:ACQuisition? (Query Only)

Queries the acquisition record identifier (ID) of the currently selected acquisition.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:CURRent:ACQuisition?
```

Returns

`<ID Number> ::= <NR1>` the record identifier number of the current acquisition.

Examples

`SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:CURRENT:ACQUISITION?` might return 848 indicating that the current acquisition record number is 848.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:CURRent:TIMestamp? (Query Only)

Queries the time stamp of the currently selected acquisition.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:CURRent: TIMestamp?
```

Returns

<time stamp> ::= <string> The current time stamp value.

Examples

SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:CURRENT:TIMESTAMP? might return “10/10/2011 10:57:55:93” indicating that the current time stamp recorded on October 10, 2011 was 10 hours, 57 minutes, and 55.93 seconds.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:FIRSt? (Query Only)

Queries the first selectable acquisition start or stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:FIRSt?

Returns

<ID Number> ::= <NR1> the record identifier number of the current acquisition.

Examples

SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:FIRST? might return 1 indicating that the first selectable acquisition start or stop value was 1.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:FIRSt:TIMestamp? (Query Only)

Queries the time stamp of the first selectable acquisition history start or stop value in the currently selected acquisition set.

Conditions

Measurement views: All

Group

Sense commands

Syntax
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:FIRSt:TIMestamp?

Returns

<time stamp> ::= <string> The first time stamp value.

Examples

SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:FIRST:TIMESTAMP? might return "10/10/2011 10:57:41:58", indicating that the first time stamp recorded on October 10, 2011 was 10 hours, 57 minutes, and 41.58 seconds.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:LAST? (Query Only)

Queries the last selectable acquisition start or stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

`[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:LAST?`

Returns

`<ID Number> ::= <NR1>` the record identifier number of the current acquisition.

Examples

`SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:LAST?` might return `1`, indicating that the last selectable acquisition start or stop value was 1.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:LAST:TIMestamp? (Query Only)

Queries the time stamp of the last selectable acquisition start or stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

`[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:LAST:TIMestamp?`

Returns

`<time stamp> ::= <string>` The last time stamp value.

Examples

`SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:LAST:TIMESTAMP?` might return `"10/10/2011 10:57:41:58"` indicating that the last time stamp recorded on October 10, 2011 was 10 hours, 57 minutes, and 41.58 seconds.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STARt

Sets or queries the acquisition start value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STARt <value>
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STARt?
```

Arguments

`<value> ::= <NR1>` is an integer in the range from one to the number of acquisitions in the acquisition history.

Examples

`SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:START?` might return `1.0000000000`, indicating the start value was 1.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STARt:TIMestamp? (Query Only)

Queries the time stamp of the current acquisition start selection.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STARt:TIMestamp?
```

Returns

`<time stamp> ::= <string>` The start time stamp value.

Examples

`SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:START:TIMESTAMP?` might return `"10/10/2011 10:57:41:58"` indicating that the time stamp of the acquisition start selection recorded on October 10, 2011 was 10 hours, 57 minutes, and 41.58 seconds.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STOP

Sets or queries the acquisition stop value in the currently selected set.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STOP <value>
[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STOP?
```

Arguments

<value> ::= <NR1> is an integer in the range from one to the number of acquisitions in the acquisition history.

Examples

SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:STOP? might return 1.0000000000, indicating the stop value was 1.

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STOP:TIMestamp? (Query Only)

Queries the time stamp of the current acquisition stop selection.

Conditions

Measurement views: All

Group

Sense commands

Syntax

[SENSe]:REANalyze:SELect:SPECtra:ACQuisition:STOP:TIMestamp?

Returns

<time stamp> ::= <string> The stop time stamp value.

Examples

SENSe:REANALYZE:SELECT:SPECTRA:ACQUISITION:STOP:TIMESTAMP? might return "10/10/2011 10:57:41:58" indicating that the time stamp of stop selection recorded on October 10, 2011 was 10 hours, 57 minutes, and 41.58 seconds.

[SENSe]:REANalyze:SPEed

Sets or queries the time delay value inserted between reanalysis of frames or acquisitions.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:SPEed <value>
[SENSe]:REANalyze:SPEed?
```

Arguments

<value>::<NR1> is an integer in the range of zero (for no delay) to four (for a maximum delay of about one second).

[SENSe]:REANalyze:STOP (No Query Form)

Stops the current reanalysis. The command will block until the current reanalysis has completed and stopped.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:STOP
```

[SENSe]:REANalyze:TIMestamp:DECimal

Sets or queries the number of values to the right of the decimal point to include in all time stamps.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:REANalyze:TIMestamp:DECimal <value>
[SENSe]:REANalyze:TIMestamp:DECimal?
```

Arguments

`<value>::<NR1>` is an integer in the range of one to nine.

SENSe:ROSCillator:EXTernal:TIMe

Sets or queries the timing reference.

If you set the source to GPS, PPS, or IRIG-B after launch of SignalVu-PC (thus changing the time from the default system time), and then disconnect from that source or otherwise lose the lock to that source, the time used will be that of the previous externally generated source. This will remain so until you set a different source with a valid signal.

Group

Sense commands

Syntax

```
SENSe:ROSCillator:EXTernal:TIMe {PPS | IBAM | IBDC | GPS | SYStem}
SENSe:ROSCillator:EXTernal:TIMe?
```

Related Commands

SENSe:ROSCillator:EXTernal:TIMe:STATus? (on page 2373)

Arguments

`PPS` is a 1PPS signal

`IBAM` is an IRIG-B AM signal

`IBDC` is an IRIG-B DC signal

`GPS` is a GNSS signal

`SYStem` is the CTRL7100A (PC) time

Returns

One of the following: PPS, IBAM, IBDC, GPS, SYStem

Examples

`SENSe:ROSCILLATOR:EXTERNAL:TIME PPS` sets the system time to 1 PPS.

SENSe:ROSCillator:EXTernal:TIMe:STATus? (Query Only)

Queries if the timing reference source is locked or unlocked.

Group

Sense commands

Syntax

```
SENSe:ROSCillator:EXTernal:TIMe:STATus?
```

Related Commands

SENSe:ROSCillator:EXTernal:TIMe (on page 2372)

Returns

0 means the timing source is unlocked.

1 means the timing source is locked.

Examples

`SENSe:ROSCILLATOR:EXTERNAL:TIME:STATUS?` might return 1, indicating the timing source is locked. This is indicated in the UI on the Timing Reference tab by a green checked box next to Valid Timing Source.

[SENSe]:ROSCillator:SOURce

Sets or queries the frequency reference oscillator source.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:ROSCillator:SOURce { INTernal | EXTernal }
[SENSe]:ROSCillator:SOURce?
```

Related Commands

SENSe:ROSCillator:EXTernal:TIMe:STATus? (on page 2373)

Arguments

`INTernal` specifies that the analyzer uses the 10 MHz internal oscillator.

`EXTernal` specifies that the analyzer uses the external reference signal. Use the Ref In connector on the rear panel to input the signal.

Selecting `EXTernal` initiates an attempt to lock the internal reference oscillator to the external reference signal. If the signal is not connected or is at an invalid frequency or amplitude, an error (2028, "External frequency reference signal not valid. Using internal reference) is returned. If not able to lock to the external reference, an error (2029, "Unable to lock to external frequency reference. Using internal reference.") is returned.

Examples

`SENSe:ROSCILLATOR:SOURCE INTernal` uses the 10 MHz internal oscillator for the frequency reference.

[SENSe]:SEM:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW) of the reference channel.

NOTE: In Real-time operation this sets the RBW for the reference and all offset channels.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:SEM:{BANDwidth|BWIDth}[:RESolution]?
```

Arguments

`<value>::<NRf>` specifies the resolution bandwidth.

Examples

`SENSe:SEM:BANDWIDTH:RESOLUTION 200kHZ` sets the resolution bandwidth to 200 kHz.

[SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo

Sets or queries the video bandwidth (VBW) of the reference channel.

NOTE: In Real-time operation this sets the RBW for the reference and all offset channels.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo <value>
[SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo?
```

Arguments

`<value>::<NRf>` specifies the video bandwidth.

Range: Current RBW/104 (1 Hz minimum) to current RBW.

Examples

SENSe:SEM:{BANDWIDTH|BWIDTH}:VIDEO 200kHZ sets the video bandwidth to 200 kHz.

[SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo:STATe

Sets or queries the state of the video bandwidth (VBW) of the reference channel.

NOTE: In Real-time operation this sets the VBW state for the reference and all offset channels.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo:STATe { OFF | ON | 0 | 1 }
[SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo:STATe?
```

Arguments

OFF or 0 turns the video bandwidth filter off.

ON or 1 turns the video bandwidth filter on.

[SENSe]:SEM:CHANnel:FILTer

Sets or queries the reference Channel Filter.

NOTE: In Real-time operation the channel filter is always forced to None.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:CHANnel:FILTer { RRC | NONE }
[SENSe]:SEM:CHANnel:FILTer?
```

Arguments

RRC selects the Root-Raised-Cosine filter.

NONE uses no filter.

Examples

SENSe:SEM:CHANNEL:FILTER RRCosine selects Root-Raised-Cosine for the reference Channel Filter.

[SENSe]:SEM:CHANnel:IBANdwidth

Sets or queries the reference channel integration bandwidth.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:CHANnel:IBANdwidth <value>
[SENSe]:SEM:CHANnel:IBANdwidth?
```

Arguments

`<value>::<NRf>` integration bandwidth

Returns

Examples

`SENSe:SEM:CHANNEL:IBANDWIDTH?` might return `18.000000E+6`, indicating that the integration bandwidth is 18 MHz.

[SENSe]:SEM:CHANnel:WIDTh

Sets or queries the reference Channel bandwidth.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:CHANnel:WIDTh <value>
[SENSe]:SEM:CHANnel:WIDTh?
```

Arguments

`<value>::<NRf>` specifies the filter bandwidth.

Examples

`SENSe:SEM:CHANNEL:WIDTH 30kHZ` sets the filter bandwidth to 30 kHz.

[SENSe]:SEM:CHIPrate

Sets or queries the Chip rate.

Use the `[SENSe]:SEM:CHANnel:FILTer` command to set the reference Channel Filter to RRC (Root-Raised Cosine).

NOTE: Applies in Swept operation only.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:CHIPrate <value>
[SENSe]:SEM:CHIPrate?
```

Arguments

`<value>::<NRf>` specifies the chip rate.

Examples

`SENSe:SEM:CHIPRATE 3.84MHZ` sets the Chip rate toe 3.84 MHz.

[SENSe]:SEM:CLEar:RESults (No Query Form)

Clears the results in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:CLEar:RESults
```

Arguments

None

Examples

`SENSe:SEM:CLEAR:RESULTS` clears the results in the measurement.

[SENSe]:SEM:FREQuency

Sets or queries the measurement frequency.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:FREQuency <value>
[SENSe]:SEM:FREQuency?
```

Arguments

`<value>::<NRf>` specifies the center frequency.

Examples

`[SENSE]:SEM:FREQUENCY 1.0GHZ` sets the center frequency to 1.0 GHz.

[SENSe]:SEM:FREQuency:SPAN? (Query Only)

Returns the frequency span.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:FREQuency:SPAN?
```

Arguments

None

Returns

<NRf> frequency span.

Examples

SENSe:SEM:FREQUENCY:SPAN? might return 100.00000E+6, indicating that the frequency span is 100 MHz.

[SENSe]:SEM:MFILter

Sets or queries the shape of the filter.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:MFILter { GAUSsian | RECTangular }
[SENSe]:SEM:MFILter?
```

Arguments

GAUSsian sets the filter shape to Gaussian.

RECTangular sets the filter shape to Rectangular.

Examples

SENSe:SEM:MFILTER RECTangular sets the filter shape to Rectangular.

[SENSe]:SEM:MODE:REALtime

Sets or queries the Real-time SEM measurement mode.

NOTE: In real-time mode SEM is measured using real-time acquisition data.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:MODE:REALtime { OFF | ON | 0 | 1 }
[SENSe]:SEM:MODE:REALtime?
```

Arguments

`ON` or `1` turns the SEM real-time measurement mode on.

`OFF` or `0` turns the SEM real-time measurement mode off.

[SENSe]:SEM:MTYPe

Sets or queries the measurement type.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:MTYPe { TPOW | PSD | PEAK }
```

Arguments

`TPOW` specifies the Total Power measurement.

`PSD` specifies the Peak Spectral Density measurement in dBM/Hz.

`PEAK` specifies a Peak power measurement.

Examples

`SENSe:SEM:MTYPE PEAK` sets the measurement type to Peak.

[SENSe]:SEM:OFFSet:DETection

Sets or queries the detection settings for all offsets.

NOTE: In Real-time operation the offset and reference detection settings are forced equal.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet:DETection { AVERage | PEAK }
[SENSe]:SEM:OFFSet:DETection?
```

Arguments

`AVERage` indicates the Offsets setting is Average (VRMS).

`PEAK` indicates the Offsets setting is the positive peak.

Examples

`SENSe:SEM:OFFSET:DETECTION AVER` sets the detection settings for all offsets to Average RMS.

[SENSe]:SEM:OFFSet<x>:BANDwidth:FILTer? (Query Only)

Returns the bandwidth filter setting for specified row in the Offsets & Limits table. The filter setting is equal to the Resolution Bandwidth (RBW) value times the number of resolution bandwidths. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:BANDwidth:FILTer?
```

Arguments

None

Returns

`<value>::<NRf>` is the filter bandwidth setting.

Examples

`SENSe:SEM:OFFSet3:BANDwidth:FILTer` might return `30.0E+3`, indicating that the filter bandwidth for row 3 to 30 kHz.

[SENSe]:SEM:OFFSet<x>:BANDwidth[:RESolution]

Sets or queries the resolution bandwidth for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table. See the [SENSe]:SEM:{BANDwidth|BWIDth}[:RESolution] (on page 2374) command.

NOTE: In Real-time operation the RBW values for each offset and the reference are set equal to the All Channels RBW setting.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:BANDwidth[:RESolution] <value>
[SENSe]:SEM:OFFSet<x>:BANDwidth[:RESolution]?
```

Returns

<value>::<NRf> specifies the resolution bandwidth.

Examples

SENSe:SEM:OFFSet4:BANDwidth 30kHz sets the resolution bandwidth in row 4 to 30 kHz.

[SENSe]:SEM:OFFSet<x>:BANDwidth:RESolution:COUNt

Sets or queries the count of Resolution Bandwidths (RBWs) for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

NOTE: In Real-time operation the RBW count is always forced to 1.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:BANDwidth:RESolution:COUNt <value>
[SENSe]:SEM:OFFSet<x>:BANDwidth:RESolution:COUNt?
```

Arguments

<value> specifies the count number of RBWs.

Examples

SENSe:SEM:OFFSet1:BANDwidth:RESolution:COUNt 10 sets the count for row 1 to 10.

[SENSe]:SEM:OFFSet<x>:BANDwidth:VIDeo

Sets or queries the video bandwidth setting for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table. See the [SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo (on page 2374) command.

NOTE: In Real-time operation the VBW values for each offset and the reference are set equal to the All Channels VBW setting.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:BANDwidth:VIDeo <value>
[SENSe]:SEM:OFFSet<x>:BANDwidth:VIDeo?
```

Arguments

<value>::<NRf> specifies the video bandwidth setting.

Examples

`SENSe:SEM:OFFSet3:BANDwidth:VIDeo 300` sets the video bandwidth for row 3 to 300 Hz.

[SENSe]:SEM:OFFSet<x>:BANDwidth:VIDeo:STATe

Sets or queries the state of the video bandwidth for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table. See the [SENSe]:SEM:{BANDwidth|BWIDth}:VIDeo:STATe (on page 2375) command.

NOTE: In Real-time operation the VBW state values for each offset and the reference are set equal to the All Channels VBW state setting.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:BANDwidth:VIDeo:STATe { OFF | ON | 0 | 1 }
[SENSe]:SEM:OFFSet<x>:BANDwidth:VIDeo:STATe?
```

Arguments

`OFF` or `0` turns the video bandwidth filter off.

`ON` or `1` turns the video bandwidth filter on.

Examples

`SENSe:SEM:OFFSet3:BANDwidth:VIDeo:STATe ON` turns on the video bandwidth filter for row 3 in the table.

[SENSe]:SEM:OFFSet<x>:FREQuency:STARt

Sets or queries the start frequency for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:FREQuency:STARt <value>
[SENSe]:SEM:OFFSet<x>:FREQuency:STARt?
```

Arguments

`<value>::<NRf>` specifies the start frequency.

Examples

`SENSe:SEM:OFFSet1:FREQuency:STARt 2.876MHZ` sets the start frequency in row 1 to 2.876 MHz.

[SENSe]:SEM:OFFSet<x>:FREQuency:STOP

Sets or queries the stop frequency for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:FREQuency:STOP <value>
[SENSe]:SEM:OFFSet<x>:FREQuency:STOP?
```

Arguments

`<value>::<NRf>` specifies the stop frequency.

Examples

`SENSe:SEM:OFFSet1:FREQuency:STOP 3.485MHZ` sets the stop frequency in row 1 to 3.485 MHz.

[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:SAME

Sets or queries the state of the limits for the absolute start and stop settings for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:SAME { OFF | ON | 0 | 1 }
[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:SAME?
```

Arguments

`OFF` or `0` indicates the start and stop limits are different.

`ON` or `1` indicates the state and stop limits are the same.

Examples

`SENSe:SEM:OFFSet2:LIMIT:ABSolute:SAME ON` sets the absolute start and stop limits for row 2 to the same values.

[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:STARt

Sets or queries the absolute power start limit for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:STARt <value>
[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:STARt?
```

Arguments

`<value>::<NRf>` specifies the power in dBm.

Examples

`SENSe:SEM:OFFSet1:LIMIT:ABSolute:STARt -71.10` sets the absolute start power limit for row 1 to −71.10 dBm.

[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:STOP

Sets or queries the absolute power stop limit for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:STOP <value>
[SENSe]:SEM:OFFSet<x>:LIMIT:ABSolute:STOP?
```

Arguments

`<value>::<NRf>` specifies the power in dBm.

Examples

`SENSe:SEM:OFFSet<x>:LIMIT:ABSolute:STOP -55.80` sets the absolute stop power limit for row 1 to −55.80 dBm.

[SENSe]:SEM:OFFSet<x>:LIMIT:MASK

Sets or queries the limit mask setting for the specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:MASK { ABS | REL | AND | OR }
[SENSe]:SEM:OFFSet<x>:LIMIT:MASK?
```

Arguments

`ABS` specifies the limit mask is set to Absolute.

REL specifies the limit mask is set to Relative

AND specifies the limit mask is set to Absolute AND Relative.

OR specifies the limit mask is set to Absolute OR Relative.

Examples

SENSe:SEM:OFFSet3:LIMIT:MASK REL sets the limit mask for row 3 to Relative.

[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:SAME

Sets or queries the state of the limits for the relative start and stop settings for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:SAME { OFF | ON | 0 | 1 }
[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:SAME?
```

Arguments

OFF or 0 indicates the start and stop limits are different.

ON or 1 indicates the state and stop limits are the same.

Examples

SENSe:SEM:OFFSet2:LIMIT:RELative:SAME ON sets the relative start and stop limits for row 2 to the same values.

[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:STARt

Sets or queries the relative power start limit for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:STARt <value>
[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:STARt?
```

Arguments

<value>::<NRf> specifies the power in dB.

Examples

SENSe:SEM:OFFSet1:LIMIT:RELative:STARt -35.5 sets the relative start power limit for row 1 to −35.5 dB.

[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:STOP

Sets or queries the relative power stop limit for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:STOP <value>
[SENSe]:SEM:OFFSet<x>:LIMIT:RELative:STOP?
```

Arguments

`<value>::<NRf>` specifies the power in dB.

Examples

`SENSe:SEM:OFFSet1:LIMIT:RELative:STOP -35.5` sets the relative stop power limit for row 1 to –35.5 dB.

[SENSe]:SEM:OFFSet<x>:LIMIT:SIDE

Sets or queries the side of the offset limit for specified row in the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:LIMIT:SIDE { LEFT | RIGHt | BOTH}
[SENSe]:SEM:OFFSet<x>:LIMIT:SIDE?
```

Arguments

`LEFT` specifies the left offset limit.

`RIGHt` specifies the right offset limit.

`BOTH` specifies both sides of the offset limit.

Examples

`SENSe:SEM:OFFSet1:LIMIT:SIDE BOTH` specifies the measurement uses both sides of the offset in row 1.

[SENSe]:SEM:OFFSet<x>:STATe (No Query Form)

Determines whether to display the specified row of the Offsets & Limits table. The parameter <x> represents the row in the Offsets & Limits table.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:OFFSet<x>:STATe { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or `0` turns off the display of the row in the measurement view.

`ON` or `1` displays the row in the measurement view.

Examples

`SENSe:SEM:OFFSet2:STATe OFF` the display of row 2 in the measurement view.

[SENSe]:SEM:POINts:COUNt

Sets or queries the maximum number of trace points per range.

NOTE: In Swept operation this is the number of trace points per range. In Real-time operation it is the number of trace points in the entire trace.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:POINts:COUNt <value>
[SENSe]:SEM:POINts:COUNt?
```

Arguments

None

Returns

`P<NR1>` number of points per range.

Examples

`SENSe:SEM:POINTS:COUNT?` might return `P8001`, indicating a maximum of 8001 trace points.

[SENSe]:SEM:PRESet (No Query Form)

Defines the standard protocol settings for the Spectral Emissions Mask measurement.

NOTE: This is an obsolete command.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:PRESet { "3GPP Downlink" | "WLAN 802.11g" | "WiMax 802.16 (ETSI)" }
```

Arguments

"`3GPP Downlink`" specifies the 3GPP Downlink standard.

"`WLAN 802.11g`" specifies the IEEE 802.11 standard for WLAN communications.

"`WiMax 802.16 (ETSI)`" specifies the WiMAX 802.16 (ETSI) standard. Quotes must be included with the arguments.

Examples

`SENSe:SEM:PRESET WLAN (802.11g)` presets the SEM measurement to the IEEE 802.11 standard for WLAN communications.

[SENSe]:SEM:REFerence:AUTO

Determines whether to automatically update the Power Reference in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:REFerence:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SEM:REFerence:AUTO?
```

Arguments

`OFF` or `0` turns off the automatic update.

`ON` or `1` automatically updates the reference power.

Examples

`SENSe:SEM:REFERENCE:AUTO ON` automatically updates the reference power in the measurement.

[SENSe]:SEM:REFerence:DETection

Sets or returns the reference channel detection setting.

NOTE: In Real-time operation the offset and reference detection settings are forced equal.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:REFerence:DETection { AVERage | PEAK }
[SENSe]:SEM:REFerence:DETection?
```

Arguments

`AVERage` indicates the reference channel detection setting is Average (VRMS).

`PEAK` indicates the reference channel detection setting is the positive peak.

Examples

`SENSe:SEM:REFERENCE:DETECTION AVER` sets the reference channel detection setting to Average RMS.

[SENSe]:SEM:REFerence[:MAGNitude]

Sets or queries the reference power magnitude.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:REFerence[:MAGNitude] <value>
[SENSe]:SEM:REFerence[:MAGNitude]?
```

Arguments

`<value>::<NRf>` specifies the magnitude in dBm.

Examples

`SENSe:SEM:REFERENCE[:MAGNITUDE]?` might return a magnitude of `-51.057`.

[SENSe]:SEM:RRCRolloff

Sets or queries the filter parameter (roll-off ratio) for the Root Raised Cosine filter.

NOTE: Applies in Swept operation only.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:RRCRolloff <value>
[SENSe]:SEM:RRCRolloff?
```

Arguments

`<value>::<NRf>` specifies the filter parameter.

Range: 0.001 to 1, 0.001 step.

Examples

`SENSe:SEM:RRCROLLOFF 0.22` sets the filter parameter to 0.22.

[SENSe]:SEM:STEP:AUTO

Determines whether to automatically update the center frequency increment/decrement step size in the Spectral Emissions Mask measurement. The Step value controls the magnitude of each step when using the front panel controls or arrow keys on the keyboard.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SEM:STEP:AUTO?
```

Related Commands

[SENSe]:SEM:STEP[:MAGNitude] (on page 2390)

Arguments

`OFF` or 0 turns off the automatic update.

`ON` or 1 automatically updates center frequency.

Examples

`SENSe:SEM:STEP:AUTO ON` automatically updates the center frequency.

[SENSe]:SEM:STEP[:MAGNitude]

Sets or queries the step magnitude for the center frequency in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:STEP[:MAGNitude] <value>
[SENSe]:SEM:STEP[:MAGNitude]?
```

Related Commands

[SENSe]:SEM:STEP:AUTO (on page 2390)

Arguments

`<value>::<NRf>` specifies the step setting.

Examples

SENSe:SEM:STEP[:MAGNITUDE] 4MHZ sets the step magnitude to 4 MHz.

[SENSe]:SEM:WIDTh:DEFinition

Sets or queries the offset definition of the measurement type in the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Sense commands

Syntax

```
[SENSe]:SEM:WIDTh:DEFinition {C2C | C2E | E2C | E2E}
[SENSe]:SEM:WIDTh:DEFinition?
```

Arguments

C2C defines the offset from the reference frequency center to the offset center.

C2E defines the offset from the reference frequency center to the offset edge.

E2C defines the offset from the reference frequency edge to the offset center.

E2E defines the offset from the reference frequency edge to the offset edge.

Examples

SENSe:SEM:WIDTH:DEFINITION C2C specifies the offset limit from the center of the reference frequency to the center of the offset.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW). Programming a specified RBW sets SENSe:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO OFF.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]?
```

Related Commands

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:RESolution:AUTO (on page 2392)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the RBW. Range: 1 Hz to 10 MHz.

Returns

<NRf> specifies the RBW.

Examples

`[SENSe]:SGRam:MEASview1:BANDwidth:RESolution 200kHz` sets the RBW to 200 kHz.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:ACTual (Query Only)

Queries the actual resolution bandwidth (RBW) in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:ACTual?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`<NRf>` The actual RBW in Hz.

Examples

`SENSe:SGRam:MEASview1:BANDwidth:RESolution:ACTual?` might return `299.624E+3`, indicating that the actual RBW is 299.624 kHz.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

OFF or 0 specifies that the resolution bandwidth is set manually using the [SENSe]:DPX:{BANDwidth|BWIDth}:ACTual? command.

ON or 1 specifies that the resolution bandwidth is set automatically.

Returns

{ OFF | ON | 0 | 1 }

Examples

SENSe:SGRam:MEASview1:BANDwidth:RESolution:AUTO ON sets the resolution bandwidth automatically.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:MODE

Determines whether to enable or disable the RBW processing in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:MODE { OFF | ON | 0 | 1 }
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:MODE?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

OFF or 0 disables the RBW processing. You can select the FFT window using the SENSe:SGRam[:MEASview<y>]:FFT:WINDow (on page 2398) command.

ON or 1 enables the RBW processing. Refer to the SENSe:SGRam:MEASview<y>:BANDwidth:RESolution (on page 2391) command to set the RBW.

Returns

{ OFF | ON | 0 | 1 }

Examples

SENSe:SGRam:MEASview1:BANDwidth:RESolution:MODE ON enables the RBW processing.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo

Sets or queries the video bandwidth (VBW). Programming a specified VBW sets SENSe:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe OFF.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo <value>
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo?
```

Related Commands

SENSe:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe (on page 2394)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the VBW.

Range: Current RBW/104 (1 Hz minimum) to Current RBW.

Returns

<NRf> specifies the VBW.

Examples

SENSe:SGRam:MEASview1:BANDwidth:VIDeo 200kHz sets the VBW to 200 kHz.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe

Determines whether to enable or disable the video bandwidth (VBW) in the spectrogram measurement.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe { OFF | ON | 0 | 1 }
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

OFF or 0 disables the VBW.

ON or 1 enables the VBW.

Returns

{ OFF | ON | 0 | 1 }

Examples

SENSe:SGRam:MEASview1:BANDwidth:VIDeo:STATe ON enables the VBW.

[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:OPTimization

Sets or queries the method of optimizing the gain and input bandwidth in the Spectrogram measurement.

Conditions

Measurement view: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:OPTimization { BEST | AUTO | MAXDynrange | MINNoise
   | MINTime }
[SENSe]:SGRam[:MEASview<y>]:{BANDwidth|BWIDth}:OPTimization?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

BEST - BEST (Best for multiple displays) causes the instrument to evaluate all the open displays and select an Acquisition Bandwidth wide enough to satisfy as many measurements as possible

AUTO - AUTO sets the gain and input bandwidth for an optimized trade-off of the competing performance choices.

MAXDynrange - MAXDynrange optimizes the gain and input bandwidth to maximize the dynamic range.

MINNoise - MINNoise optimizes the gain and input bandwidth to minimize noise.

MINTime - MINTime optimizes the gain and input bandwidth to minimize sweep time.

Returns

{ BEST | AUTO | MAXDynrange | MINNoise | MINTime }

Examples

SENSe:SGRam:MEASview1:BANDwidth:OPTimization? might return AUTO, which optimizes automatically the gain and input.

[SENSe]:SGRam[:MEASview<y>]:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:COLor { RED | GREen | BLUe | CYAN | BCYan| YELLow | MAGenta | GRAY |
   TEMPerature | SPECtral }
[SENSe]:SGRam[:MEASview<y>]:COLor?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

The following table lists the arguments.

Color palette for spectrogram

Argument	Palette
RED	Red
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray
TEMPerature	Temperature
SPECtral	Spectral

Returns

{ RED | GREen | BLUe | CYAN | BCYan| YELLow | MAGenta | GRAY | TEMPerature | SPECtral }

Examples

`SENSe:SGRam:MEASview1:COLor TEMPerature` selects the temperature color palette.

[SENSe]:SGRam[:MEASview<y>]:COLor:MAXimum

Sets or queries the maximum value of the color axis in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:COLor:MAXimum <value>
[SENSe]:SGRam[:MEASview<y>]:COLor:MAXimum?
```

Related Commands

SENSe:SGRam[:MEASview<y>]:COLor:MINimum (on page 2397)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the maximum value of the color axis.

Range: -100 to +100 dBm.

Returns

<NRf> specifies the maximum value of the color axis.

Examples

SENSe:SGRam:MEASview1:COLor:MAXimum 10 sets the maximum value of the color axis to 10 dBm.

[SENSe]:SGRam[:MEASview<y>]:COLor:MINimum

Sets or queries the minimum value of the color axis in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:COLor:MINimum <value>
[SENSe]:SGRam[:MEASview<y>]:COLor:MINimum?
```

Related Commands

SENSe:SGRam[:MEASview<y>]:COLor:MAXimum (on page 2396)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the minimum value of the color axis.

Range: -100 to +100 dBm.

Returns

<NRf> specifies the minimum value of the color axis.

Examples

SENSe:SGRam:MEASview1:COLor:MINimum 10 sets the minimum value of the color axis to 10 dBm.

[SENSe]:SGRam[MEASview<y>]:COLor:REVerse

Sets or queries reverse color scheme state.

Conditions

Applicable measurement view must be active.

Group

Sense commands

Syntax

```
[SENSe]:SGRam:COLor:REVerse {OFF | ON | 0 | 1}
[SENSe]:SGRam:COLor:REVerse?
```

Related Commands

[SENSe]:SGRam[:MEASview<y>]:COLor (on page 2395)

Arguments

`OFF` or `0` disables Reverse color scheme.

`ON` or `1` enables Reverse color scheme.

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

Returns

`0` disables Reverse color scheme.

`1` enables Reverse color scheme.

Examples

`SENSe:SGRam:MEASview1:COLor:REVerse OFF` disables reverse color scheme.

[SENSe]:SGRam[:MEASview<y>]:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement view: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:CLEar:RESults
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Examples

`SENSe:SGRam:MEASview1:CLEar:RESults` clears the results of spectrogram and restarts multi-trace functions.

[SENSe]:SGRam[:MEASview<y>]:FFT:WINDow

Sets or queries the FFT window in the spectrogram.This command is equivalent to `SENSe:SGRam[:MEASview<y>]:FILTer:SHAPe`.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FFT:WINDow { KAISer | MIL6db | CISPr | BH4B | UNIForm | FLATtop |
    HANNing }
[SENSe]:SGRam[:MEASview<y>]:FFT:WINDow?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

KAISer selects the Kaiser (RBW) window.

MIL6db selects the -6 dB RBW (MIL) window.

CISPr selects the CISPR window.

BH4B selects the Blackman-Harris 4B type window.

UNIForm selects the uniform window.

FLATtop selects the flat-top window.

HANNing selects the Hanning window.

Returns

{ KAISer | MIL6db | CISPr | BH4B | UNIForm | FLATtop | HANNing }

Examples

SENSe:SGRam:MEASview1:FFT:WINDow HANNing selects the Hanning window.

[SENSe]:SGRam[:MEASview<y>]:FILTer[:SHAPe]

Sets or queries the filter shape in the spectrogram. This command is equivalent to SENSe:SGRam[:MEASview<y>]:FFT:WINDow.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FILTer[:SHAPe] { KAISer | MIL6db | CISPr | BH4B | UNIForm | FLATtop |
    HANNing }
[SENSe]:SGRam[:MEASview<y>]:FILTer[:SHAPe]?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

KAISer selects the Kaiser (RBW) window.

MIL6db selects the -6 dB RBW (MIL) window.

CISPr selects the CISPR window.

BH4B selects the Blackman-Harris 4B type window.

UNIForm selects the uniform window.

FLATtop selects the flat-top window.

HANNing selects the Hanning window.

Returns

{ KAISer | MIL6db | CISPr | BH4B | UNIForm | FLATtop | HANNing }

Examples

SENSe:SGRam:MEASview1:FILTer:SHAPe HANNing selects the Hanning window.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:CENTer

Sets or queries the center frequency in the spectrogram.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:CENTer <value>
[SENSe]:SGRam[:MEASview<y>]:FREQuency:CENTer?
```

Related Commands

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STARt (on page 2402)

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STOP (on page 2404)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Returns

<NRf> specifies the center frequency.

Examples

SENSe:SGRam:MEASview1:FREQuency:CENTer 7.5GHz sets the center frequency to 7.5 GHz.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN

Sets or queries the frequency span in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN <value>
[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`<value>::<NRf>` specifies the frequency span.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Returns

<NRf> specifies the frequency span.

Examples

`SENSe:SGRam:MEASview1:FREQuency:SPAN 20MHz` sets the span to 20 MHz.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio

Sets or queries the ratio of span to RBW (Resolution Bandwidth) in the spectrogram. This command is valid when `SENSe:SGRam[:MEASview<y>]:BANDwidth:RESolution:AUTO` is set to On.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <value>
[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the ratio of span to RBW. Range: 20 to 1000.

Programming a specified ratio sets the RBW (= span/ratio), which is rounded down to the nearest valid value.

Returns

<NRf> specifies the ratio of span to RBW.

Examples

SENSe:SGRam:MEASview1:FREQuency:SPAN:BANDwidth:RESolution:RATio 200 sets the ratio to 200, setting the RBW to 200 kHz for the span of 40 MHz.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN:MAXimum (No Query Form)

Sets the frequency range to the maximum real-time span in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:SPAN:MAXimum
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Examples

SENSe:SGRam:MEASview1:FREQuency:SPAN:MAXimum sets the frequency range to the maximum real-time span.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STARt

Sets or queries the measurement start frequency (left edge of the graph) in the spectrogram.

The center, start and stop frequencies are set interlocking each other. Refer to the SENSe:SGRam[:MEASview<y>]:FREQuency:CENTer (on page 2400) command.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STARt <value>
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STARt?
```

Related Commands

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STOP (on page 2404)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> is the measurement start frequency.

Range: (center frequency) ± (span)/2.

Returns

<NRf> specifies the measurement start frequency.

Examples

SENSe:SGRam:MEASview1:FREQuency:STARt 6.95GHz sets the start frequency to 6.95 GHz.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP

Sets or queries the frequency step size. Programming a specified step size sets [SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP:AUTO OFF.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP <value>
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP?
```

Related Commands

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP:AUTO (on page 2404)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Returns

<NRf> specifies the frequency step size.

Examples

SENSe:SGRam:MEASview1:FREQuency:STEP 1kHz sets the frequency step size to 1 kHz.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STEP:AUTO?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`OFF` or `0` specifies that the frequency step size is set manually using the `SENSe:SGRam[:MEASview<y>]:FREQuency:STEPsize` command.

`ON` or `1` specifies that the frequency step size is set automatically.

Returns

```
{ OFF | ON | 0 | 1 }
```

Examples

`SENSe:SGRam:MEASview1:FREQuency:STEP:AUTO ON` specifies that the frequency step size is set automatically.

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STOP

Sets or queries the measurement stop frequency (right edge of the graph) in the spectrogram.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:SGRam[:MEASview<y>]:FREQuency:CENTer (on page 2400) command.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STOP <value>
[SENSe]:SGRam[:MEASview<y>]:FREQuency:STOP?
```

Related Commands

[SENSe]:SGRam[:MEASview<y>]:FREQuency:STARt (on page 2402)

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`<value>::<NRf>` is the measurement stop frequency.

Range: (center frequency) ± (span)/2.

Returns

<NRf> specifies the measurement stop frequency.

Examples

`SENSe:SGRam:MEASview1:FREQuency:STOP 7.05GHz` sets the stop frequency to 7.05 GHz.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:MODe

Sets or queries the vertical mode.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:MODe {NORMal | MONitor}
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:MODe?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`NORMal` indicates the instrument is set to normal mode.

`MONitor` indicates the instrument is set to Spectrum Monitor mode.

Returns

{NORMal | MONitor}

Examples

`SENSe:SGRam:MEASview1:TIME:SCALe:MODe MONITOR` set the instrument to Spectrum Monitor mode.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:OVERlap

Sets or queries the Overlap. Note that changing this value may change the time per division value (DISPlay:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:DIVision).

Conditions

Measurement view: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:OVERlap <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:OVERlap?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value> = <NRf> specifies the overlap.

Returns

<NRf> specifies the overlap.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:OVERlap 1.0E-1 sets the overlap to 0.1.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:OVERlap: PERCent

Sets or queries the Overlap in percent. Note that changing this value may change the time per division SENSe:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:DIVision value.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:OVERlap:PERCent <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:OVERlap:PERCent?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the overlap in percent.

Returns

<NRf> specifies the overlap in percent.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:OVERlap:PERCent 1.0E1 sets the overlap to 10%.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:DIVision

Sets or queries the vertical Time/division value. Note that changing this value may change the DISPlay:SGRam[:MEASview<y>]:TIME:OVERlap:PERCent value.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:DIVision <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:DIVision?
```

Related Commands

DISPlay:SGRam[:MEASview<y>]:TIME:OVERlap:PERCent (on page 1010)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the time per division in seconds.

Returns

<NRf> specifies the overlap in percent.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:PER:DIVision? might return 1.1160000000E-3.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:ZOOM

Sets or queries the zoom scale in the scale tab of spectrogram.

Conditions

Measurement view: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:ZOOM <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:ZOOM?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value> = <NRf> specifies the zoom scale value.

Returns

<NRf> specifies the overlap.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:ZOOM 2 sets the zoom scale to 2.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:AUTO

Sets the scale to autoscale in the spectrogram.

Conditions

Measurement view: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:AUTO
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

None

Examples

`SENSe:SGRam:MEASview1:TIME:SCALe:AUTO` sets the scale to auto.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:STARt

Sets or queries the start time in the spectrogram.

Conditions

Measurement view: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:STARt <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:STARt?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value> = <NRf> specifies the start time in seconds.

Returns

<NRf> specifies the start time in seconds.

Examples

`SENSe:SGRam:MEASview1:TIME:SCALe:STARt?` might return 1E-6 s.

[SENSe]:SGRam[:MEASview<y>]:SELEcted:SOURce

Returns the Source number of specified Spectrogram trace.

Conditions

Measurement view: Spectrogram

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:SELEcted:SOURce {"Source 1"|"Source 2"|"Source 3"|"Source 4"}
[SENSe]:SGRam[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

```
{"Source 1"|"Source 2"|"Source 3"|"Source 4"}
```

Examples

`SENSe:SGRam:MEASview1:SELEcted:SOURce?` might return Source 2 for the trace of Spectrogram measurement view 1.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:UPDate:MINutes

Sets or queries the Spectrum Monitor mode Time/Update value for minutes.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:UPDate:MINutes <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:UPDate:MINutes?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`<value>::<NRf>` sets the time/update value in minutes.

Returns

<NRf> specifies the time/update value in minutes.

Examples

`SENSe:SGRam:MEASview1:TIME:SCALe:PER:UPDate:MINutes 1E1` sets the Time/update minutes value to 10.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:UPDate:SEConds

Sets or queries the Spectrum Monitor mode Time/Update value for seconds.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:UPDate:SEConds <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:PER:UPDate:SEConds?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> sets the time/update value in seconds.

Returns

<NRf> specifies the time/update value in seconds.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:PER:UPDate:SEConds 1E1 sets the Time/update seconds value to 10.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:SPECtrums:PERLine (Query Only)

Queries the Spectrums/Line value.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:SPECtrums:PERLine?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<NRf> specifies Spectrum/Line value.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:SPECtrums:PERLine? might return a 1.0000000000 as a response.

[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:STARt:DIVisions

Sets or queries the Vertical offset or Position in divisions.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:STARt:DIVisions <value>
[SENSe]:SGRam[:MEASview<y>]:TIME[:SCALe]:STARt:DIVisions?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> sets the vertical offset value in divisions. Range is -130,000 to +130,000.

Returns

<NRf> specifies vertical offset value in divisions.

Examples

SENSe:SGRam:MEASview1:TIME:SCALe:STARt:DIVisions 10 sets the vertical offset to 10 divisions

[SENSe]:SGRam[:MEASview<y>]:WATerfall:DIRection

Sets or queries the direction of the Waterfall (3-D spectrogram) display.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:DIRection { NW | NE }
[SENSe]:SGRam[:MEASview<y>]:WATerfall:DIRection?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

NW sets the display direction to northwest.

NE sets the display direction to northeast.

Returns

{ NW | NE }

Examples

SENSe:SGRam:MEASview1:WATerfall:DIRection NW sets the waterfall display direction to northwest.

[SENSe]:SGRam[:MEASview<y>]:WATerfall:ENABle

Sets or queries the Waterfall (3-D spectrogram) display.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:ENABle { OFF | ON | 0 | 1 }
[SENSe]:SGRam[:MEASview<y>]:WATerfall:ENABle?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

OFF or 0 disables the Waterfall display.

ON or 1 enables the Waterfall display.

Returns

{ OFF | ON | 0 | 1 }

Examples

SENSe:SGRam:MEASview1:WATerfall:ENABle ON enables the 3-D Waterfall display.

[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:AUTO (No Query Form)

Rescales the height axis automatically to fit the waveform to the screen in the 3-D Waterfall display.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:AUTO
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Examples

SENSe:SGRam:MEASview1:WATerfall:Y:SCALe:AUTO rescales the height scale automatically to fit the waveform to the 3-D Waterfall display.

[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:OFFSet

Sets or queries the height offset (the value at the top edge of the vertical axis) of the 3-D Waterfall display.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:OFFSet <value>
[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:OFFSet?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the height (vertical) offset. Range: -270 to +150 dBm.

Returns

<NRf> specifies the height (vertical) offset.

Examples

SENSe:SGRam:MEASview1:WATerfall:Y:SCALe:OFFSET 12.5 sets the offset to 12.5 dB in the 3-D Waterfall display.

[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:RESet (No Query Form)

Resets the height scale of the 3-D Waterfall display to the default values: Height position= 0 dB and Height scale = 100 dB

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]:RESet
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Examples

SENSe:SGRam:MEASview1:WATerfall:Y:SCALe:RESET rescales the height scale automatically to fit the waveform to the 3-D Waterfall display.

[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]

Sets or queries the height (vertical) range of the Waterfall (3-D spectrogram) display.

Conditions

Measurement views: Spectrogram

Group

Sense commands

Syntax

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe] <value>
```

```
[SENSe]:SGRam[:MEASview<y>]:WATerfall:Y[:SCALe]?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<value>::<NRf> specifies the vertical range. Range: 0.1 to 200 dB. The amplitude unit is set by the [SENSe]:POWer:UNITs command.

You can omit the unit in the argument. When you include the unit in the argument, only dB is available. For the amplitude units Watts, Volts, and Amps, omit the unit in the argument.

Returns

<NRf> specifies the vertical range.

Examples

SENSe:SGRam:MEASview1:WATerfall:Y:SCALe 100dB sets the height range to 100 dB in the 3-D Waterfall display.

[SENSe]:SIGNalpath:PRIority

Sets or queries the signal path priority for the measurements.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SIGNalpath:PRIority { RF | LF }
[SENSe]:SIGNalpath:PRIority?
```

Arguments

RF sets the signal path to high frequency range.

LF sets the signal path to low frequency range.

Examples

SENSe:SIGNALPATH:PRIORITY LF sets the low frequency signal path when measurements are completely within LF frequency range.

[SENSe]:SIGNalvu:ACQuisition:CONTrol:HORizontal

Sets or queries the other acquisition or Horizontal settings. When the checkbox is checked, the SignalVu controls the Horizontal settings of oscilloscope.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:CONTrol:HORizontal?
[SENSe]:SIGNalvu:ACQuisition:CONTrol:HORizontal { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or 0 disables Horizontal settings checkbox.

`ON` or 1 enables Horizontal settings checkbox.

Returns

0 disables Horizontal settings checkbox.

1 enables Horizontal settings checkbox.

Examples

`SENSe:SIGNalvu:ACQuisition:CONTrol:HORizontal OFF` disables the Horizontal settings from the SignalVu.

[SENSe]:SIGNalvu:ACQuisition:CONTrol:SAMPle:RATE

Sets or queries the Sample rate, when the checkbox is checked, the SignalVu controls the Sample rate of the oscilloscope.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:CONTrol:SAMPle:RATE?
[SENSe]:SIGNalvu:ACQuisition:CONTrol:SAMPle:RATE { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or 0 disables Sample rate checkbox.

`ON` or 1 enables Sample rate checkbox.

Returns

0 disables Sample rate checkbox.

1 enables Sample rate checkbox.

Examples

`SENSe:SIGNalvu:ACQuisition:CONTrol:SAMPle:RATE OFF` disables the Sample rate from the SignalVu.

[SENSe]:SIGNalvu:ACQuisition:CONTrol:SOURce<x>:STATe

Sets or queries the Source checkbox state of measurement source for RF, I & Q, Diff I & Q data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:CONTrol:SOURce<x>:STATe?
[SENSe]:SIGNalvu:ACQuisition:CONTrol:SOURce<x>:STATe { OFF | ON | 0 | 1 }
```

Arguments

<x>=1 to 8 representing Range of source

OFF or 0 disables Source State.

ON or 1 enables Source State.

Returns

0 disables Source State.

1 enables Source State.

Examples

SENSe:SIGNalvu:ACQuisition:CONTrol:SOURce1:STATe OFF disables Source State.

[SENSe]:SIGNalvu:ACQuisition:CONTrol:TRIGger:POSition

Sets or queries the Trigger position, when the checkbox is checked, the SignalVu controls the Trigger position of oscilloscope.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:CONTrol:TRIGger:POSition?
[SENSe]:SIGNalvu:ACQuisition:CONTrol:TRIGger:POSition { OFF | ON | 0 | 1 }
```

Arguments

OFF or 0 disables Trigger position checkbox.

ON or 1 enables Trigger position checkbox.

Returns

0 disables Trigger position checkbox.

1 enables Trigger position checkbox.

Examples

SENSe:SIGNalvu:ACQuisition:CONTrol:TRIGger:POSition OFF disables the Trigger position from the SignalVu.

[SENSe]:SIGNalvu:ACQuisition:CONTrol:VERTical

Sets or queries the Vertical settings, when the checkbox is checked, the SignalVu controls the vertical settings of the oscilloscope.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:CONTrol:VERTical?
[SENSe]:SIGNalvu:ACQuisition:CONTrol:VERTical { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or 0 disables Vertical settings checkbox.

`ON` or 1 enables Vertical settings checkbox.

Returns

0 disables Vertical settings checkbox.

1 enables Vertical settings checkbox.

Examples

`SENSe:SIGNalvu:ACQuisition:CONTrol:VERTical OFF` disables Vertical settings from the SignalVu.

[SENSe]:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATe

Sets or queries the oscilloscope Sample rate from the Acquisition control panel oscilloscope settings of the SignalVu.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE?
[SENSe]:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE
```

Arguments

`<value>::<NRf>` specifies the sample rate.

Range: 3.125 S/s to 100 GS/s.

Returns

`<NRf>` specifies the sample rate.

Examples

`SENSe:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE 50E+9` sets the oscilloscope sample rate to 50 GS/s.

[SENSe]:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE:AUTo

Determines whether to set the oscilloscope Sample rate automatically or manually from the Acquisition control panel oscilloscope settings of the SignalVu.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE:AUTo?
[SENSe]:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE:AUTo { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or 0 specifies the oscilloscope sample rate is set manually.

`ON` or 1 specifies the oscilloscope sample rate is set automatically.

Examples

`SENSe:SIGNalvu:ACQuisition:DIGitizer:SAMPle:RATE:AUTo ON` sets the oscilloscope Sample rate automatically.

[SENSe]:SIGNalvu:ACQuisition:GLOBal:REFlevel

Sets or queries the Global Reference level.

Conditions

Should be connected to MSO/LPD to Set or Query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:GLOBal:REFlevel? (Query)
[SENSe]:SIGNalvu:ACQuisition:GLOBal:REFlevel <value>
```

Arguments

`<value>::<NRf>` specifies the global reference level

Range: {-130 to 30} in dBm

Returns

`<NRf>`

Examples

`SENSe:SIGNalvu:ACQuisition:GLOBal:REFlevel?` might return 5, which indicates the global ref level value is 5.

[SENSe]:SIGNalvu:ACQuisition:INPuttype:REFlevel

Sets or queries the Reference Level input type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition:INPuttype:REFlevel? (Query)
[SENSe]:SIGNalvu:ACQuisition:INPuttype:REFlevel {PERChannel | PERSource | GLOBal}
```

Arguments

`PERChannel` sets the Input Reflevel to Per Channel.

`PERSource` sets the Input Reflevel to Per Source.

`GLOBal` sets the Input Reflevel to Global.

Examples

`SENSe:SIGNalvu:ACQuisition:INPuttype:REFlevel PERChannel` sets input reflevel to per channel.

[SENSe]:SIGNalvu:ACQuisition:IQ:CALibrate (No query form)

Starts the IQ calibration.

Conditions

Should be connected to MSO/LPD/SX.

Group

Sense commands

Syntax

```
SENSe:SIGNalvu:ACQuisition:IQ:CALibrate
```

Examples

`SENSe:SIGNalvu:ACQuisition:IQ:CALibrate` starts the IQ calibration.

[:SENSe]:SIGNalvu:ACQuisition:NULL:IQ:OFFSet:CLEAR

Use this command to clear Null IQ offset values that were calculated using Calibrate IQ.

Related Commands

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CALIbrate:IQ (on page 2423)

Conditions

Should be connected to MSO/LPD/SX to query.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition:NULL:IQ:OFFSet:CLEAR
```

Examples

```
:SENSe:SIGNalvu:ACQuisition:NULL:IQ:OFFSet:CLEAR
```

[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:COUPling

Sets or queries the per channel coupling of the measurement. The parameter <x>=1 to 8 represents the channel index.

Conditions

Should be connected to MSO/LPD set or query.

This cmd is query only in case of SX.

Group

Sense commands

Syntax

```
:SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:COUPling {AC | DC}
:SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:COUPling? (Query)
```

Argument

`AC` sets the specified channel to AC coupling.

`DC` sets the specified channel to DC coupling.

Examples

`SENSe:SIGNalvu:ACQuisition:PER:CHANnel1:COUPling AC` sets coupling of channel 1 to AC.

[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:DESkew

Sets or queries the per channel Deskew of the measurement. The parameter <x>=1 to 8 represents the channel index.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:DESkew <value>
[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:DESkew? (Query)
```

Argument

`<value>::<NRf>` specifies the deskew.

Returns

`<NRf>`

Examples

`SENSe:SIGNalvu:ACQuisition:PER:CHANnel:DESkew:RF 125.0000000000E-9` sets the deskew of channel measurement to 125 ns.

[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:EXTattn

Sets or queries the per channel External attenuation of the measurement. The parameter <x>=1 to 8 represents the channel index.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:EXTattn <value>
[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:EXTattn? (Query)
```

Argument

`<value>::<NRf>` specifies the external attenuation.

Returns

`<NRf>`

Examples

`SENSe:SIGNalvu:ACQuisition:PER:CHANnel1:EXTattn:RF 30.0000000000` sets external attenuation of channel measurement to 30 dB.

SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:INSTrument:BWIDth (Query only)

Queries the per channel instrument bandwidth of the measurement. The parameter <x>=1 to 8 represents the channel index.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

```
Syntax
SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:INSTrument:BWIDth? (Query)
```

Returns

`<NRf>`

Examples

`SENSe:SIGNalvu:ACQuisition:PER:CHANnel1:INSTrument:BWIDth? 500.0000E+06` indicates that instrument bandwidth of channel 1 is 500 MHz.

[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:REFlevel

Sets or queries per channel reference level of the measurement. The parameter <x>=1 to 8 represents the channel index.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:REFlevel<value>
```

[:SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:REFlevel?(Query)

Argument

<value>::<NRf> specifies the reference level.

Returns

<NRf>

Examples

SENSe:SIGNalvu:ACQuisition:PER:CHANnel1:REFlevel 20.0000000000, sets the reference level of the channel 1 measurement to 20 dB.

[SENSe]:SIGNalvu:ACQuisition:PER:CHANnel<x>:TERMination

Sets or queries the per channel termination of the measurement. The parameter <x>=1 to 8 represents the channel index.

Conditions

Should be connected to MSO/LPD/SX to set or query.

Group

Sense commands

Syntax

SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:TERMination {FIFTyohms|ONEMegohms}
SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:TERMination? (Query)

Argument

FIFTyohms sets the channel input resistance as 50 Ω.

ONEMegaohms sets the channel input resistance to 1 MΩ.

Returns

<NRf>

Examples

SENSe:SIGNalvu:ACQuisition:PER:CHANnel<x>:TERMination FIFTyohms sets the termination of the Channel 1 to 50 ohms.

[SENSe]:SIGNalvu:ACQuisition:RESet (No query form)

Clears the acquisition data and restarts the SignalVu acquisitions from the oscilloscope.

Conditions

Should be connected to MSO/LPD/SX.

Group

Sense commands

Syntax

SENSe:SIGNalvu:ACQuisition:RESet

Examples

`SENSe:SIGNalvu:ACQuisition:RESet` resets the Signalvu acquisitions from the oscilloscope.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CALIbrate:IQ

Use this command to perform null IQ offset operation for each source. It is effective from the next acquisition.

The parameter <x>=1 to 8 represents the number of sources.

Related Commands

SENSe:SIGNalvu:ACQuisition:NULL:IQ:OFFSet:CLEAR (on page 2419)

Conditions

Should be connected to MSO/LPD/SX to query.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CALIbrate:IQ
```

Examples

```
SENSe:SIGNalvu:ACQuisition:SOURce1:CALIbrate:IQ
```

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel[:RF]

Sets or queries the channel of measurement source for RF data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel[:RF] {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" | "CH6"
    | "CH7" | "CH8"}
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel[:RF]? (Query)
```

Arguments

The parameter <x>=1 to 8 representing Range of Source.

Examples

`SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:RF?` might return `CH1`, which indicates the channel of measurement source for RF data type.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:I

Sets or queries the channel of measurement source for I data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:I {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" | "CH6" |
   "CH7"|"CH8"}
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:I? (Query)
```

Arguments

The parameter <x>=1 to 8 representing Range of Source.

Examples

`SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:I?` might return `CH1`, which indicates the channel of measurement source for I data type.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:Q

Sets or queries the channel of measurement source for Q data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:Q {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" | "CH6" |
   "CH7" | "CH8"}
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:Q? (Query)
```

Arguments

The parameter `<x>`=1 to 8 representing Range of source.

Examples

`SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:Q?` might return `CH1`, which indicates the channel of measurement source for Q data type.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:IPLus

Sets or queries the channel of measurement source for IPlus data type .

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:IPLus {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" |
   "CH6" | "CH7" | "CH8"}
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:IPLus? (Query)
```

Arguments

The parameter <x>=1 to 8 representing Range of source.

Examples

`SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:IPLus?` might return `CH1`, which indicates the channel of measurement source IPlus data type.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:IMINus

Sets or queries the channel of measurement source for IMinus data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:IMINus {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" |
   "CH6" | "CH7" | "CH8"}
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:IMINus? (Query)
```

Arguments

The parameter <x>=1 to 8 representing Range of source.

Examples

`SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:IMINus?` might return `CH1`, which indicates the channel of measurement source for IMinus data type.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:QPLus

Sets or queries the channel of measurement source for QPlus data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:QPLus {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" |
   "CH6" | "CH7" | "CH8" }
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:QPLus? (Query)
```

Arguments

The parameter <x>=1 to 8 representing Range of source.

Examples

SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:QPLus? might return CH1, which indicates the channel of measurement source for QPlus data type.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:QMINus

Sets or queries the channel of measurement source for QMinus data type.

Conditions

Should be connected to MSO/LPD to Set or Query.

Source keyword is optional, if not present Source1 will be default source.

Group

Sense commands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:QMINus {"CH1" | "CH2" | "CH3" | "CH4"| "CH5" |
   "CH6" | "CH7"|"CH8"
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:CHANnel:QMINus? (Query)
```

Arguments

The parameter <x>=1 to 8 representing Range of source.

Examples

SENSe:SIGNalvu:ACQuisition:SOURce1:CHANnel:QMINus? might return CH1, which indicates the channel of measurement source for QMinus data type.

[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]: DOWNconverter:INJEctionside

Sets or queries the downconverter injection side. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to set or query.

Source keyword is optional, if not present, Source1 will be default source.

Group

Sense commands

Syntax

```
:SENSe:SIGNalvu:ACQuisition:SOURce<x>:DOWNconverter:INJEctionside {LOWI | HIGH }
:SENSe:SIGNalvu:ACQuisition:SOURce<x>:DOWNconverter:INJEctionside? (Query)
```

Examples

ACQuisition:SOURce1:DOWNconverter:INJEctionside? might return LOWI, which indicates the downconverter injection side set to low.

[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]: DOWNconverter:INSTrument:BANDwidth:MAXFreq

Sets or queries the maximum range of the instrument bandwidth. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to set or query.

Source keyword is optional, if not present, Source1 will be default source.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INSTrument:BANDwidth:MAXFreq <value>
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INSTrument:BANDwidth:MAXFreq? (Query)
```

Argument

<value>::<NRf> specifies the minimum value of the instrument bandwidth being used.

Returns

<NRf>

Examples

SENSe:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:INSTrument:BANDwidth:MaxFreq? might return 7.5000000000E+9, which indicates the maximum range of the instrument bandwidth.

[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]: DOWNconverter:INSTrument:BANDwidth:MINFreq

Sets or queries the minimum range of instrument bandwidth. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to set or query.

Source keyword is optional, if not present, Source1 will be default source.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INSTrument:BANDwidth:MINFreq <value>
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:INSTrument:BANDwidth:MINFreq? (Query)
```

Argument

<value>::<NRf> specifies the minimum value of the instrument bandwidth being used.

Returns

<NRf>

Examples

SENSe:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:INSTrument:BANDwidth:MINFreq? might return 0 Hz, which indicates the minimum range of the instrument bandwidth.

[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:LOFReq

Sets or queries the downconverter LO frequency. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to set or query.

Source keyword is optional, if not present, Source1 will be default source.

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:LOFReq <value>
[:Senses]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:LOFReq? (Query)
```

Argument

<value>::<NRf> specifies the LO frequency.

Returns

<NRf>

Examples

:SENSe:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:LOFReq 3.0000000000E+9 sets the LO frequency to 3 GHz.

[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:STATe

Sets or queries the downconverter state. The parameter <x>=1 to 8 represents the range of the source.

Conditions

Should be connected to MSO/LPD/RSA/SX to set or query.

Source keyword is optional, if not present, Source1 will be default source.

Group

Sense commands

Syntax

```
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:STATe{ TRUE | FALSE}
[:SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:DOWNconverter:STATe? (Query)
```

Examples

:SENSe:SIGNalvu:ACQuisition:SOURce1:DOWNconverter:STATe TRUE enables the downconverter for Source 1.

[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:PERSrc:REFlevel

Sets or queries the Reference level Per source .

Conditions

Should be connected to MSO/LPD to Set or Query.

Group

Sense comands

Syntax

```
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:PERSrc:REFlevel? (Query)
[SENSe]:SIGNalvu:ACQuisition[:SOURce<x>]:PERSrc:REFlevel <Value>
```

Arguments

<value>::<NRf> specifies the global reference level

Range: {-130 to 30} in dBm

Returns

`<NRf>`

Examples

`SENSe:SIGNalvu:ACQuisition:SOURce1:PERSrc:REFlevel?` might return `5`, which indicates the ref level value of source 1 is 5.

[SENSe]:SPECtrum[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of the selected Measurement view in pulse trace

Conditions

Measurement views: Spectrum with specified Measurement view number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:SELEcted:SOURce {"Source1" | "Source2" | ""Source3" | "Source4" }
[SENSe]:SPECtrum[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

`<y>`=1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1

Examples

`:SENSe:SPECtrum:TRACE:MEASVIEW1:SELECTED:SOURCE?` queries the Source of the Spectrum Measurement View 1.

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW). Programming a specified RBW sets `[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO OFF`.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:SPECtrum[:MEASview<y>[:{BANDwidth|BWIDth}[:RESolution]?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO (on page 2431)

Arguments

`<value>::<NRf>` specifies the RBW. Range: 1 Hz to 10 MHz.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSE:SPECTRUM:MEASVIEW2:BANDWIDTH:RESOLUTION 200kHz` sets the RBW to 200 kHz.

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:ACTual? (Query Only)

Queries the actual resolution bandwidth (RBW) in the spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:ACTual?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<NRf>` The actual RBW in Hz.

Examples

SENSE:SPECTRUM:MEASVIEW2:BANDWIDTH:RESOLUTION:ACTUAL? might return 299.624E+3, indicating that the actual RBW is 299.624 kHz.

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually in the spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO { OFF| ON | 0 | 1 }
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO?
```

Arguments

OFF or 0 specifies that the resolution bandwidth is set manually using the [SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution] command.

ON or 1 specifies that the resolution bandwidth is set automatically.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSE:SPECTRUM:MEASVIEW2:BANDWIDTH:RESOLUTION:AUTO ON sets the resolution bandwidth automatically.

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:MODE

Determines whether to enable or disable the RBW process.

NOTE: This is an obsolete command.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:MODE { OFF| ON | 0 | 1 }
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:MODE?
```

Arguments

OFF or 0 disables the RBW process. You can select the FFT window using the [SENSe]:SPECtrum[:MEASview<y>]:FFT:WINDow command.

ON or 1 enables the RBW process. Refer to the [SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution] command to set the RBW.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSE:SPECTRUM:MEASVIEW2:BANDWIDTH:RESOLUTION:MODE ON` enables the RBW process.

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo

Sets or queries the video bandwidth (VBW). Programming a specified VBW sets `[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe OFF`.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo <value>
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo?
```

Arguments

`<value>::<NRf>` specifies the VBW.

Range: Current RBW/104 (1 Hz minimum) to Current RBW.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSE:SPECTRUM:MEASVIEW2:BANDWIDTH:VIDEO 200kHz` sets the VBW to 200 kHz.

[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe

Determines whether to enable or disable the video bandwidth (VBW) in the spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe { OFF | ON| 0 | 1 }
[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}:VIDeo:STATe?
```

Arguments

`OFF` or `0` disables the VBW.

`ON` or `1` enables the VBW.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSE:SPECTRUM:MEASVIEW2:BANDWIDTH:VIDEO:STATE ON` enables the VBW.

[SENSe]:SPECtrum[:MEASview<y>]:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max/Min Hold).

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

`[SENSe]:SPECtrum[:MEASview<y>]:CLEar:RESults`

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:CLEar:RESults` restarts multi-trace functions.

[SENSe]:SPECtrum[:MEASview<y>]:COLor

Sets or queries the color palette of three-dimensional graphs.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

`[SENSe]:SPECtrum[:MEASview<y>]:COLor {RED | GREen | BLUe | CYAN | BCYan | YELLow | MAGenta | GRAY | TEMPerature | SPECtral}`

`[SENSe]:SPECtrum[:MEASview<y>]:COLor?`

Arguments

The following table lists the arguments.

Argument	Description
`RED`	Red

Argument	Description
GREen	Green
BLUe	Blue
CYAN	Cyan
BCYan	Binary cyan
YELLow	Yellow
MAGenta	Magenta
GRAY	Gray
TEMPerature	Temperature
SPECtral	Spectral

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

SENSE:SPECTRUM:COLOR TEMPERATURE selects the temperature color palette.

[SENSe]:SPECtrum[:MEASview<y>]:COLor:MAXimum

Sets or queries the maximum value of the color axis in the Spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

[SENSe]:SPECtrum[:MEASview<y>]:COLor:MAXimum <value>

[SENSe]:SPECtrum[:MEASview<y>]:COLor:MAXimum?

Arguments

<value>::=<NRf> specifies the maximum value of the color axis.

Range: The minimum value to 100%.

The minimum value is set using the [SENSe]:SPECtrum[:MEASview<y>]:COLor:MINimum command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

SENSE:SPECTRUM:COLOR:MAXIMUM 90 sets the maximum value of the color axis to 90%.

[SENSe]:SPECtrum[:MEASview<y>]:COLor:MINimum

Sets or queries the minimum value of the color axis in the Spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

`[SENSe]:SPECtrum[:MEASview<y>]:COLor:MINimum <value>`

`[SENSe]:SPECtrum[:MEASview<y>]:COLor:MINimum?`

Arguments

`<value>::=<NRf>` specifies the minimum value of the color axis.

Range: 0% to the maximum value.

The maximum value is set using the `[SENSe]:SPECtrum[:MEASview<y>]:COLor:MAXimum` command.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:SPECTRUM:COLOR:MINIMUM 10` sets the minimum value of the color axis to 10%.

[SENSe]:SPECtrum[:MEASview<y>]:COLor:REVerse[:STATe]

Determines whether to reverse the color palette in the Spectrum view. When reversed, the highest density takes the color normally used for the lowest.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

`[SENSe]:SPECtrum[:MEASview<y>]:COLor:REVerse[:STATe] {OFF | ON | 0 | 1}`

`[SENSe]:SPECtrum[:MEASview<y>]:COLor:REVerse[:STATe]?`

Arguments

`OFF` or `0` uses the color palette in its normal order.

`ON` or `1` reverses the color palette.

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`SENSE:SPECTRUM:COLOR:REVERSE:STATE ON` reverses the color palette.

[SENSe]:SPECtrum[:MEASview<y>]:FFT:WINDow

Sets or queries the FFT window in the spectrum measurement.This command is equivalent to `[SENSe]:SPECtrum[:MEASview<y>]:FILTer[:SHAPe]`.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FFT:WINDow { KAISer | MIL6db | CISPr | BH4B| UNIForm | FLATtop |
   HANNing }
[SENSe]:SPECtrum[:MEASview<y>]:FFT:WINDow?
```

Arguments

`KAISer` selects the Kaiser (RBW) window.

`MIL6db` selects the -6 dB RBW (MIL) window.

`CISPr` selects the CISPR window.

`BH4B` selects the Blackman-Harris 4B type window.

`UNIForm` selects the uniform window.

`FLATtop` selects the flat-top window.

`HANNing` selects the Hanning window.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSE:SPECTRUM:MEASVIEW2:FFT:WINDOW HANNing` selects the Hanning window.

[SENSe]:SPECtrum[:MEASview<y>]:FILTer[:SHAPe]

Sets or queries the filter shape in the spectrum measurement. This command is equivalent to `[SENSe]:SPECtrum[:MEASview<y>]:FFT:WINDow`.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FILTer[:SHAPe] { KAISer | MIL6db | CISPr | BH4B | UNIForm | FLATtop
   | HANNing }
[SENSe]:SPECtrum[:MEASview<y>]:FILTer[:SHAPe]?
```

Arguments

`KAISer` selects the Kaiser (RBW) window.

`MIL6db` selects the -6 dB RBW (MIL) window.

CISPr selects the CISPR window.

BH4B selects the Blackman-Harris 4B type window.

UNIForm selects the uniform window.

FLATtop selects the flat-top window.

HANNing selects the Hanning window.

Examples

SENSe:SPECTRUM:MEASVIEW1:FILTER:SHAPE HANNing selects the Hanning window.

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:CENTer

Sets or queries the center frequency in the spectrum measurement.

NOTE: The center, start and stop frequencies are set interlocking each other with the following relationships: (start frequency) = (center frequency) - (span)/2 and (stop frequency) = (center frequency) + (span)/2.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:CENTer <value>
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:CENTer?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STARt (on page 2439)

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STOP (on page 2440)

Arguments

<value>::<NRf> specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSE:SPECTRUM:MEASVIEW2:FREQUENCY:CENTER 7.5GHz sets the center frequency to 7.5 GHz..

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:SPAN

Sets or queries the frequency span in the spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:SPAN <value>
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:SPAN?
```

Arguments

`<value>::<NRf>` specifies the frequency span.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:FREQuency:SPAN 20MHz` sets the span to 20 MHz

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio

Sets or queries the ratio of span to RBW (Resolution Bandwidth) in the spectrum measurement. This command is valid when `[SENSe]:SPECtrum[:MEASview<y>]:{BANDwidth|BWIDth}[:RESolution]:AUTO` is set to On.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <value>
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:SPAN:BANDwidth[:RESolution]:RATio?
```

Arguments

`<value>::<NRf>` specifies the ratio of span to RBW. Range: 20 to 1000. Programming a specified ratio sets the RBW (= span/ratio), which is rounded down to the nearest valid value.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:FREQuency:SPAN:BANDwidth:RESolution:RATio 200` sets the ratio to 200, setting the RBW to 200 kHz for the span of 40 MHz.

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STARt

Sets or queries the measurement start frequency (left edge on the graph) in the spectrum measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:SPECtrum[:MEASview<y>]:FREQuency:CENTer (on page 2437) command.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STARt <value>
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STARt?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STOP (on page 2440)

Arguments

`<value>::<NRf>` is the measurement start frequency.

Range: (center frequency) ±(span)/2.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:FREQuency:STARt 6.95GHz` sets the start frequency to 6.95 GHz.

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP

Sets or queries the frequency step size (the amount per press by which the up or down key changes the setting value). Programming a specified step size sets `[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP:AUTO OFF`.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:SPECtrum[:MEASview<y>]:FREQuency:CENTer (on page 2437) command.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP <value>
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP:AUTO (on page 2440)

Arguments

`<value>::<NRf>` specifies the frequency step size.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:FREQuency:STEP 1.5kHz` sets the step size to 1.5 kHz.

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP:AUTO

Determines whether to set the frequency step size automatically or manually.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP:AUTO?
```

Arguments

`OFF` or `0` specifies that the frequency step size is set manually using the `[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STEP` command.

`ON` or `1` specifies that the frequency step size is set automatically.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:FREQuency:STEP:AUTO ON` sets the frequency step size automatically

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STOP

Sets or queries the measurement stop frequency (right edge on the graph) in the spectrum measurement.

The center, start and stop frequencies are set interlocking each other. Refer to the [SENSe]:SPECtrum[:MEASview<y>]:FREQuency:CENTer (on page 2437) command.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STOP <value>
```

```
[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STOP?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:FREQuency:STARt (on page 2439)

Arguments

`<value>::<NRf>` is the measurement start frequency.

Range: (center frequency) ± (span)/2.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:FREQuency:STOP 7.05` sets the stop frequency to 7.05 GHz.

[SENSe]:SPECtrum[:MEASview<y>]:LENGth

Sets or queries the spectrum length when `[SENSe]:SPECtrum:TIMe:MODe` is `INDependent`. Programming a specified length sets `[SENSe]:SPECtrum[:MEASview<y>]:LENGth:AUTO OFF`.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:LENGth <value>
[SENSe]:SPECtrum[:MEASview<y>]:LENGth?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:LENGth:AUTO (on page 2442)

[SENSe]:SPECtrum[:MEASview<y>]:STARt (on page 2443)

Arguments

`<value>::<NRf>` specifies the spectrum length.

Range: 0 to [(acquisition length) - (spectrum start)].

If [(spectrum start) + (spectrum length)] > (acquisition length), the actual spectrum length is reduced to the acquisition length.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECtrum:MEASview2:LENGth 38.5us` sets the spectrum length to 38.5 µs.

[SENSe]:SPECtrum[:MEASview<y>]:LENGth:ACTual (Query Only)

Queries the actual spectrum length.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:LENGth:ACTual?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<NRf>` Actual spectrum length in seconds.

Examples

`SENSe:SPECtrum:MEASview2:LENGth:ACTual?` might return `6.337E-6`, indicating that the actual spectrum length is 6.337 µs

[SENSe]:SPECtrum[:MEASview<y>]:LENGth:AUTO

Sets or queries the spectrum length mode (automatic or manual) when `[SENSe]:SPECtrum:TIMe:MODe` is INDependent.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:LENGth:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SPECtrum[:MEASview<y>]:LENGth:AUTO?
```

Arguments

`OFF` or `0` sets the spectrum length manually, using the `[SENSe]:SPECtrum:LENGth` command.

`ON` or `1` sets the spectrum length automatically.

Examples

`SENSe:SPECTRUM:MEASview1:LENGTH:AUTO ON` sets the spectrum length automatically.

[SENSe]:SPECtrum[:MEASview<y>]:MAX:SPAN (No Query Form)

Sets the frequency span to the maximum full span instead of the maximum real-time span. The maximum span depends on the model.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:MAX:SPAN
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:SPECtrum:MEASview2:MAX:SPAN sets the frequency span to the maximum span.

[SENSe]:SPECtrum[:MEASview<y>]:POINts:COUNt

Sets or queries the number of sample points on the signal spectrum.

Conditions

Measurement views: Spectrum

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:POINts:COUNt { P801 | P1601 | P2401 | P3201| P4001 | P6401 | P8001 |
   P10401 }
[SENSe]:SPECtrum[:MEASview<y>]:POINts:COUNt?
```

Arguments

P801 sets the number of sample points to 801.

P1601 sets the number of sample points to 1601.

P2401 sets the number of sample points to 2401.

P3201 sets the number of sample points to 3201.

P4001 sets the number of sample points to 4001.

P6401 sets the number of sample points to 6401.

P8001 sets the number of sample points to 8001.

P10401 sets the number of sample points to 10401.

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

SENSe:SPECtrum:MEASview2:POINts:COUNt P801 sets the number of sample points to 801.

[SENSe]:SPECtrum[:MEASview<y>]:STARt

Sets or queries the spectrum offset time when [SENSe]:SPECtrum[:MEASview<y>]:TIMe:MODe is INDependent.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:STARt <value>
[SENSe]:SPECtrum[:MEASview<y>]:STARt?
```

Related Commands

[SENSe]:SPECtrum[:MEASview<y>]:LENGth (on page 2441)

Arguments

`<value>::<NRf>` specifies the spectrum offset time.

Range: 0 to the acquisition length.

If [(spectrum start) + (spectrum length)] > (acquisition length), the actual spectrum length is reduced to the acquisition length.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECTRUM:MEASview1:START 23.5us` sets the analysis offset to 23.5 µs.

[SENSe]:SPECtrum[:MEASview<y>]:STARt:AUTO

Sets or queries the spectrum offset mode (automatic or manual) when `[SENSe]:SPECtrum[:MEASview<y>]:TIMe:MODe` is INDependent.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:STARt:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SPECtrum[:MEASview<y>]:STARt:AUTO?
```

Arguments

`OFF` or `0` sets the spectrum offset manually.

`ON` or `1` sets the spectrum length automatically.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECTRUM:MEASview1:START:AUTO ON` sets the spectrum offset automatically.

[SENSe]:SPECtrum[:MEASview<y>]:TIMe:MODe

Sets or queries the spectrum time parameter mode (automatic or manual).

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SPECtrum[:MEASview<y>]:TIMe:MODe { INDependent | COMMon }
[SENSe]:SPECtrum[:MEASview<y>]:TIMe:MODe?
```

Related Commands

[SENSe]:ANALysis (on page 2005) commands

Arguments

`INDependent` sets the spectrum time parameters manually, using the `[SENSe]:SPECtrum:STARt` and `[SENSe]:SPECtrum:LENGth` commands.

`COMMon` sets the spectrum time parameters automatically using the analysis time settings.

The parameter `<y>`=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Examples

`SENSe:SPECTRUM:MEASview1:TIME:MODE COMMon` sets the spectrum time parameters automatically.

[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}

Sets or queries the channel bandwidth for the carrier as power reference. This command is valid when `[SENSe]:SPURious:REFerence` is set to `CARRier`.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth} <value>
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}?
```

Arguments

`<value>::<NRf>` specifies the channel bandwidth.

Range: 100 Hz to 40 MHz (Standard) / 110 MHz (Option 110).

Examples

`SENSe:SPURIOUS:CARRIER:BANDWIDTH 20MHz` sets the channel bandwidth to 20 MHz.

[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}:INTegration

Sets or queries the integration bandwidth to calculate the carrier power. This command is valid when `[SENSe]:SPURious:REFerence` is set to `CARRier`.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}:INTegration <value>
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}:INTegration?
```

Arguments

`<value>::<NRf>` specifies the integration bandwidth.

Range: 100 Hz to 40 MHz (Standard) / 110 MHz (Option 110).

Examples

`SENSe:SPURIOUS:CARRIER:BANDWIDTH:INTEGRATION 2MHz` sets the integration bandwidth to 2 MHz.

[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth (RBW) to measure the carrier power. This command is valid when `[SENSe]:SPURious:REFerence` is set to `CARRier`. Programming a specified RBW sets `[SENSe]:SPURious:CARRier:BANDwidth[RESolution]:AUTO` OFF.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution] <value>
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]?
```

Related Commands

[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]:AUTO (on page 2446)

Arguments

`<value>::<NRf>` specifies the RBW. Range: 1 Hz to 10 MHz.

Examples

`SENSe:SPURIOUS:CARRIER:BANDWIDTH:RESOLUTION 200kHz` sets the RBW to 200 kHz.

[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]:AUTO

Determines whether to set the resolution bandwidth (RBW) automatically or manually when the power reference is set to carrier (`[SENSe]:SPURious:REFerence` is set to `CARRier`) in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]: AUTO { OFF | ON | 0 | 1 }
[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]: AUTO?
```

Arguments

`OFF` or `0` specifies that the resolution bandwidth is set manually using the `[SENSe]:SPURious:CARRier:{BANDwidth|BWIDth}[:RESolution]` command.

`ON` or `1` specifies that the resolution bandwidth is set automatically.

Examples

`SENSe:SPURIOUS:CARRIER:BANDWIDTH:RESOLUTION:AUTO ON` sets the resolution bandwidth automatically.

[SENSe]:SPURious:CARRier:DETection

Sets or queries the carrier detection method. This command is valid when `[SENSe]:SPURious:REFerence` is set to `CARRier`.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:DETection { AVERage | PEAK | AVGLog}
[SENSe]:SPURious:CARRier:DETection?
```

Arguments

`AVERage` selects the average detection.

`PEAK` selects the peak detection.

`AVGLog` selects the average (of logs) detection.

Examples

`SENSe:SPURIOUS:CARRIER:DETECTION PEAK` selects the peak detection.

[SENSe]:SPURious:CARRier:FREQuency

Sets or queries the carrier frequency in the Spurious measurement. This command is valid when `[SENSe]:SPURious:REFerence` is set to `CARRier`.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:FREQuency <value>
[SENSe]:SPURious:CARRier:FREQuency?
```

Arguments

`<value>::<NRf>` specifies the carrier frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:SPURIOUS:CARRIER:FREQUENCY 7.5GHz` sets the carrier frequency to 7.5 GHz.

[SENSe]:SPURious:CARRier:THReshold

Sets or queries the threshold level to detect the carrier in the Spurious measurement. This command is valid when `[SENSe]:SPURious:REFerence` is set to `CARRier`.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CARRier:THReshold <value>
[SENSe]:SPURious:CARRier:THReshold?
```

Arguments

`<value>::<NRf>` specifies the threshold level above which the input signal is determined to be a carrier. Range: -170 to +50 dBm. The unit can be changed by the `[SENSe]:POWer:UNITs` or `UNIT:POWer` command.

Examples

`SENSe:SPURIOUS:CARRIER:THRESHOLD -25` sets the carrier threshold level to -25 dBm.

[SENSe]:SPURious:CLEar:RESults (No Query Form)

Restarts multi-trace functions (Average and Max Hold).

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:CLEar:RESults
```

Arguments

None

Examples

`SENSe:SPURIOUS:CLEAR:RESULTS` restarts multi-trace functions.

[SENSe]:SPURious[:FREQuency]:OVERlap? (Query Only)

Queries whether any of the frequency ranges (A to T) overlap, including the carrier when `[SENSe]:SPURious:REFerence` is set to `CARRier`.

NOTE: If there are any overlaps between the ranges, the measurement will not run correctly.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious[:FREQuency]:OVERlap?
```

Arguments

None

Returns

0 (no overlap) or 1 (overlap).

Examples

`SENSe:SPURIOUS:FREQUENCY:OVERLAP?` might return `1`, indicating that some frequency ranges overlap.

[SENSe]:SPURious:LIST

Sets or queries how to list the spurious signals in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:LIST { ALL | OVERlimit }
[SENSe]:SPURious:LIST?
```

Arguments

`ALL` lists all of the detected spurious signals.

`OVERlimit` lists the spurious signals exceeding the limits. Use the `[SENSe]:SPURious:RANGe<x>:LIMit` command group to set the limits.

Examples

SENSe:SPURIOUS:LIST ALL lists all of the detected spurious signals.

[SENSe]:SPURious:MODE

Sets or queries the frequency range mode in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:MODE { MULTi | SINGle }
[SENSe]:SPURious:MODE?
```

Arguments

MULTi displays all of the ranges that are enabled. Use the [SENSe]:SPURious:RANGe<x>:STATe command to enable the range.

SINGle displays only the range that the selected spurious signal is in. Use the DISPlay:SPURious:SELect:NUMBer command to select the spurious signal.

Examples

SENSe:SPURIOUS:MODE MULTi displays all of the enabled ranges.

[SENSe]:SPURious:OPTimization

Sets or queries the method of optimizing the gain and input bandwidth in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:OPTimization { AUTO | MINTime | MAXDynrange| MINNoise }
[SENSe]:SPURious:OPTimization?
```

Arguments

AUTO optimizes automatically the gain and input bandwidth.

MINTime optimizes the gain and input bandwidth to minimize sweep time.

MAXDynrange optimizes the gain and input bandwidth to maximize the dynamic range.

MINNoise optimizes the gain and input bandwidth to minimize noise.

Examples

SENSe:SPURIOUS:OPTIMIZATION AUTO optimizes automatically the gain and input bandwidth.

[SENSe]:SPURious:POINts:COUNt

Sets or queries the number of sample points on the spectrum trace per range in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:POINts:COUNt { P801 | P2401 | P4001 | P8001| P10401 }
[SENSe]:SPURious:POINts:COUNt?
```

Arguments

`P801` sets the trace points to 801 per range.

`P2401` sets the trace points to 2401 per range.

`P4001` sets the trace points to 4001 per range.

`P8001` sets the trace points to 8001 per range.

`P10401` sets the trace points to 10401 per range.

Examples

`SENSe:SPURIOUS:POINTS:COUNT P801` sets the trace points to 801 per range.

[SENSe]:SPURious:RANGe<x>:BANDwidth:VIDeo

Sets or queries the video bandwidth (VBW) in the specified frequency range. Programming a specified VBW sets `[SENSe]:SPURious:BANDwidth:VIDeo STATe OFF`.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:BANDwidth:VIDeo <value>
[SENSe]:SPURious:RANGe<x>:BANDwidth:VIDeo?
```

Related Commands

[SENSe]:SPECtrum:{BANDwidth|BWIDth}:VIDeo:STATe (on page 2432)

Arguments

`<value>::<NRf>` specifies the VBW.

Range: Current RBW/104 (1 Hz minimum) to Current RBW.

Examples

`SENSe:SPURIOUS:RANGE1:BANDWIDTH:VIDEO 200kHz` sets the VBW to 200 kHz for Range A.

[SENSe]:SPURious:RANGe<x>:BANDwidth:VIDeo:STATe

Determines whether to enable or disable the video bandwidth (VBW) in the specified frequency range.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:BANDwidth:VIDeo:STATe { OFF | ON| 0 | 1 }
[SENSe]:SPURious:RANGe<x>:BANDwidth:VIDeo:STATe?
```

Arguments

`OFF` or `0` disables the VBW.

`ON` or `1` enables the VBW.

Examples

`SENSe:SPURIOUS:RANGE1:BANDWIDTH:VIDEO:STATE ON` enables the VBW for Range A.

[SENSe]:SPURious:RANGe<x>:DETection

Sets or queries the spurious detection method in the specified frequency range. The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:DETection { AVERage | PEAK | QUASipeak | CAVerage | CPEak | AVGLog }
[SENSe]:SPURious:RANGe<x>:DETection?
```

Arguments

`AVERage` selects the average detection.

`PEAK` selects the peak detection.

`QUASipeak` selects the quasi-peak detection.

`CAVerage` selects the CISPR average detection.

`CPEak` selects the CISPR peak detection.

`AVGLog` selects the average (of logs) detection.

Examples

`SENSe:SPURIOUS:RANGE1:DETECTION PEAK` selects the peak detection for Range A.

[SENSe]:SPURious:RANGe<x>:EXCursion

Sets or queries the excursion level (how far down the signal must drop between spurious emissions) in the specified frequency range.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:EXCursion <value>
[SENSe]:SPURious:RANGe<x>:EXCursion?
```

Arguments

`<value>::<NRf>` specifies the excursion level. A signal with amplitude less than the excursion level is considered to be a noise. Range: 1 to 50 dB.

Examples

`SENSe:SPURIOUS:RANGE1:EXCURSION 8` sets the excursion level to 8 dB.

[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]

Sets or queries the filter shape to search the specified frequency range for spurious signals.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe] { RBW | MIL6db | CISPr }
[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]?
```

Arguments

`RBW` selects the RBW filter.

`MIL6db` selects the -6 dB RBW (MIL) filter.

`CISPr` selects the CISPR filter.

Examples

`SENSe:SPURIOUS:RANGE1:FILTER:SHAPE CISPr` uses the CISPR filter in Range A.

[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth

Sets or queries the filter bandwidth to search the specified frequency range for spurious signals.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth <value>
[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth?
```

Arguments

`<value>::<NRf>` specifies the filter bandwidth.

The setting range varies depending on the center frequency and trace detector when using the CISPR filters and detectors. Otherwise, the bandwidth minimum is a function of the span (= (stop frequency) - (start frequency)) of the range and the maximum is fixed at 5 MHz.

By default, the value is set automatically (`[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO` is `ON`). When the detection is set to CISPR QPk (`[SENSe]:SPURious:RANGe<x>:DETection` is `QUASipeak`), only one value is allowed, which is set automatically.

Examples

`SENSe:SPURIOUS:RANGE1:FILTER:SHAPE:BANDWIDTH 200kHz` sets the filter bandwidth to 200 kHz for Range A.

[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO

Determines whether to set the filter bandwidth automatically or manually for the specified frequency range in the Spurious measurement.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO { OFF | ON | 0 | 1 }
[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth:AUTO?
```

Arguments

`OFF` or `0` specifies that the filter bandwidth is set manually using the `[SENSe]:SPURious:RANGe<x>:FILTer[:SHAPe]:BANDwidth` command.

`ON` or `1` specifies that the filter bandwidth is set automatically.

Examples

`SENSe:SPURIOUS:RANGE1:FILTER:SHAPE:BANDWIDTH:AUTO ON` sets the filter bandwidth automatically for Range A.

[SENSe]:SPURious:RANGe<x>:FREQuency:STARt

Sets or queries the start frequency of the specified range in the Spurious measurement.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

NOTE: The frequency ranges must not be overlapped. Use the `[SENSe]:SPURious[:FREQuency]:OVERlap?` query to check whether there is any overlap.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:FREQuency:STARt <value>
[SENSe]:SPURious:RANGe<x>:FREQuency:STARt?
```

Arguments

`<value>::<NRf>` specifies the start frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Examples

`SENSe:SPURIOUS:RANGE1:FREQUENCY:START 1.615GHz` sets the start frequency of Range A to 1.615 GHz.

[SENSe]:SPURious:RANGe<x>:FREQuency:STOP

Sets or queries the stop frequency of the specified range in the Spurious measurement.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

NOTE: The frequency ranges must not be overlapped. Use the `[SENSe]:SPURious[:FREQuency]:OVERlap?` query to check whether there is any overlap.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:FREQuency:STOP <value>
[SENSe]:SPURious:RANGe<x>:FREQuency:STOP?
```

Arguments

`<value>::<NRf>` specifies the stop frequency.

Range:

- RSA5103B – 0 to 3 GHz
- RSA5106B – 0 to 6.2 GHz
- RSA5115B – 0 to 15 GHz
- RSA5126B – 0 to 26.5 GHz

Examples

`SENSe:SPURIOUS:RANGE1:FREQUENCY:STOP 1.715GHz` sets the stop frequency of Range A to 1.715 GHz.

[SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STARt

Sets or queries the absolute amplitude of the limits at the start (left edge) of the specified range in the Spurious measurement. This command is valid when `[SENSe]:SPURious:RANGe<x>:LIMit:MASK` is set to ABS, AND, or OR.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STARt <value>
[SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STARt?
```

Arguments

`<value>::<NRf>` specifies the absolute start amplitude of the limits.

Range: -170 to +50 dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` or `UNIT:POWer` command.

Examples

`SENSe:SPURIOUS:RANGE1:LIMIT:ABSOLUTE:START -30` sets the absolute start amplitude of the limits for Range A to -30 dBm.

[SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STOP

Sets or queries the absolute amplitude of the limits at the stop (right edge) of the specified range in the Spurious measurement. This command is valid when `[SENSe]:SPURious:RANGe<x>:LIMit:MASK` is set to ABS, AND, or OR.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STOP <value>
[SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STOP?
```

Related Commands

[SENSe]:POWer:UNITs (on page 2319)

UNIT:POWer (on page 2794)

Arguments

<value>::<NRf> specifies the absolute stop amplitude of the limits.

Range: -170 to +50 dBm.

The unit can be changed by the [SENSe]:POWer:UNITs or UNIT:POWer command.

Examples

SENSe:SPURIOUS:RANGE1:LIMIT:ABSOLUTE:STOP -10 sets the absolute stop amplitude of the limits for Range A to -10 dBm.

[SENSe]:SPURious:RANGe<x>:LIMit:MASK

Sets or queries the limit mask function mode for the specified range in the Spurious measurement.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:LIMit:MASK{ABS|REL|AND|OR|OFF}
[SENSe]:SPURious:RANGe<x>:LIMit:MASK?
```

Arguments

The following table lists the arguments.

Limit mask mode

Argument	Description
ABS	Failure is detected when one of the spurious signals is larger than the absolute amplitude limit.
REL	Failure is detected when one of the spurious signals is larger than the relative amplitude limit.
AND	Failure is detected when one of the spurious signals is larger than the absolute AND relative amplitude limits.
OR	Failure is detected when one of the spurious signals is larger than the absolute OR relative amplitude limit.
OFF	Disables the mask.

To set the absolute amplitude limits, use the [SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STARt and [SENSe]:SPURious:RANGe<x>:LIMit:ABSolute:STOP commands.

To set the relative amplitude limits, use the [SENSe]:SPURious:RANGe<x>:LIMit:RELative:STARt and [SENSe]:SPURious:RANGe<x>:LIMit:RELative:STOP commands.

Examples

SENSe:SPURIOUS:RANGE1:LIMIT:MASK ABS specifies that failure is detected when one of the spurious signals is larger than the absolute amplitude limit in Range A.

[SENSe]:SPURious:RANGe<x>:LIMit:RELative:STARt

Sets or queries the relative amplitude of the limits at the start (left edge) of the specified range in the Spurious measurement. This command is valid when [SENSe]:SPURious:RANGe<x>:LIMit:MASK is set to REL, AND, or OR.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:LIMit:RELative:STARt <value>
[SENSe]:SPURious:RANGe<x>:LIMit:RELative:STARt?
```

Arguments

<value>::<NRf> specifies the relative start amplitude of the limits.

Range: -100 to 0 dB.

Use the [SENSe]:SPURious:REFerence command to select the power reference.

Examples

SENSe:SPURIOUS:RANGE1:LIMIT:RELATIVE:START -30 sets the relative start amplitude of the limits for Range A to -30 dB.

[SENSe]:SPURious:RANGe<x>:LIMit:RELative:STOP

Sets or queries the relative amplitude of the limits at the stop (right edge) of the specified range in the Spurious measurement. This command is valid when [SENSe]:SPURious:RANGe<x>:LIMit:MASK is set to REL, AND, or OR.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:LIMit:RELative:STOP <value>
[SENSe]:SPURious:RANGe<x>:LIMit:RELative:STOP?
```

Arguments

<value>::<NRf> specifies the relative stop amplitude of the limits.

Range: -100 to 0 dB.

Use the [SENSe]:SPURious:REFerence command to select the power reference.

Examples

SENSe:SPURIOUS:RANGE1:LIMIT:RELATIVE:STOP -10 sets the relative stop amplitude of the limits for Range A to -10 dB.

[SENSe]:SPURious:RANGe<x>:STATe

Determines whether to enable or disable the frequency range in the Spurious measurement.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:STATe { OFF | ON | 0 | 1 }
[SENSe]:SPURious:RANGe<x>:STATe?
```

Arguments

OFF or 0 disables the frequency range.

ON or 1 enables the frequency range.

Examples

SENSe:SPURIOUS:RANGE1:STATE ON enables Range A.

[SENSe]:SPURious:RANGe<x>:THReshold

Sets or queries the threshold level to detect spurious signals in the specified frequency range.

The parameter <x> = 1 to 20, representing Range A to T, respectively.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:RANGe<x>:THReshold <value>
[SENSe]:SPURious:RANGe<x>:THReshold?
```

Arguments

<value>::<NRf> specifies the threshold level above which the signal is determined to be spurious. Range: -50 to +30 dBm.

The unit can be changed by the [SENSe]:POWer:UNITs or UNIT:POWer command.

Examples

SENSe:SPURIOUS:RANGE1:THRESHOLD -25 sets the threshold level to -25 dBm in Range A.

[SENSe]:SPURious:REFerence

Sets or queries the power reference in the Spurious measurement.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:REFerence { CARRier | MANual | NONE }
[SENSe]:SPURious:REFerence?
```

Arguments

`CARRier` uses the carrier as the power reference.

`MANual` sets the power reference using the `[SENSe]:SPURious:REFerence:MANual:POWer` command.

`NONE` uses no reference.

Examples

`SENSe:SPURIOUS:REFERENCE CARRier` uses the carrier as the power reference.

[SENSe]:SPURious:REFerence:MANual:POWer

Sets or queries the reference power level in the Spurious measurement. This command is valid when `[SENSe]:SPURious:REFerence` is set to MANual.

Conditions

Measurement views: Spurious

Group

Sense commands

Syntax

```
[SENSe]:SPURious:REFerence:MANual:POWer <value>
[SENSe]:SPURious:REFerence:MANual:POWer?
```

Arguments

`<value>::<NRf>` specifies the reference power level. Range: -170 to +50 dBm.

The unit can be changed by the `[SENSe]:POWer:UNITs` or `UNIT:POWer` command.

Examples

`SENSe:SPURIOUS:REFERENCE:MANUAL:POWER -25` sets the reference power level to -25 dBm.

[SENSe]:SQUality[:MEASview<y>]:EVM:ALL[:STATe]

Sets or queries whether or not the display of both EVM and Offset EVM results is enabled. Offset EVM appears only for OQPSK and SOQPSK modulation types.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Sense commands

Syntax

```
[SENSe]:SQUality[:MEASview<y>]:EVM:ALL[:STATe]
[SENSe]:SQUality[:MEASview<y>]:EVM:ALL[:STATe]?
```

Arguments

`OFF` or 0 disables the local lockout operation.

`ON` or 1 enables the local lockout operation.

[SENSe]:SQUality[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Signal quality for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal Quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:SQUality[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:SQUality[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

`SENSe:SQUality:MEASview1:SELECTED:SOURce?` queries the Source for Signal quality Measurement View 1.

[SENSe]:STABle[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Symbol table for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Symbol table

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod symbol table).

Source cannot be changed when the acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:STABle [:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:STABle [:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on the number of sources of connected instrument, where MEASview keyword is optional by default and y is 1.

Examples

`SENSe:STABle:MEASview1:SELEcted:SOURce?` queries the Source for Symbol table Measurement View 1.

[SENSe]:SVPC:ACQuisition:CONTrol:TRIGger

Sets or queries the Trigger Settings checkbox state.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
[SENSe]:SVPC:ACQuisition:CONTrol:TRIGger { OFF | ON | 0 | 1 }
[SENSe]:SVPC:ACQuisition:CONTrol:TRIGger?
```

Arguments

`OFF` or `0` disables the Trigger Settings.

`ON` or `1` enables the Trigger Settings.

Examples

`SENSe:SVPC:ACQuisition:CONTrol:TRIGger ON` enables the Trigger setting.

[SENSe]:SVPC:ACQuisition:CONTrol:CHANnel

Sets or queries the Channel Settings checkbox state.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]: SVPC:ACQuisition:CONTrol:CHANnel { OFF | ON | 0 | 1 }
```

Arguments

`OFF` or `0` disables the channel settings.

`ON` or `1` enables the channel settings.

Examples

`SENSe: SVPC:ACQuisition:CONTrol:CHANnel ON` enables the Channel Settings.

[SENSe]:SVPC:ACQuisition:FFRame:ACTual? (Query only)

Queries the actual number of Fast Frames.

Conditions

Requires an RSA/MSO be connected with SVPC. Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SVPC:ACQuisition:FFRame:ACTual?
```

Arguments

None

Returns

`<NR1>` The actual number of Fast Frames.

Examples

`SENSe: SVPC:ACQuisition:FFRame:ACTual?` might return 178, indicating that the actual number of Fast Frames is 178.

[SENSe]:SVPC:ACQuisition:FFRame:LIMit

Sets or queries the limit number of Fast Frames.

Conditions

Requires an RSA/MSO be connected with SignalVu-PC. Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SVPC:ACQuisition:FFRame:LIMit
[SENSe]:SVPC:ACQuisition:FFRame:LIMit?
```

Arguments

`<value>::<NR1>` specifies the fast frame limit. Range: 1 to 65535 frames.

Where

1 to 65535 frames for RSA 5000A series. For others, the range is 1 to 220 -1 frames.

Examples

`SENSe: SVPC:ACQUISITION:FFRAME:LIMIT 500` sets the Fast Frame limit to 500.

[SENSe]:SVPC:ACQuisition:FFRame:STATe

Determines whether to enable or disable the Fast Frame.

Conditions

Requires an RSA/MSO be connected with SVPC. Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:SVPC:ACQuisition:FFRame:STATe { OFF | ON | 0 | 1 }
[SENSe]:SVPC:ACQuisition:FFRame:STATe?
```

Arguments

`OFF` or `0` disables the Fast Frame.

`ON` or `1` enables the Fast Frame.

Examples

`SENSe: SVPC:ACQUISITION:FFRAME:STATE ON` enables the Fast Frame.

[SENSe]:TDIagram[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Source of Trellis diagram for a selected Measurement view number.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Trellis diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Trellis diagram).

Source cannot be changed when the acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:TDIagram [:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:TDIagram [:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1.

Examples

SENSe:TDIagram:MEASview1:SELEcted:SOURce? queries the Source for Trellis diagram Measurement View 1.

SENSe:TOFF:POWEr:SPECtral:DENSity

Sets or queries the limit set for comparison of the Toff power spectral density value in the Limits tab of the LTE Power vs Time display settings control panel.

Conditions

Measurement view: LTE Power vs Time

Group

Sense commands

Syntax
```
SENSe:TOFF:POWEr:SPECtral:DENSity <value>
SENSe:TOFF:POWEr:SPECtral:DENSity?
```

Arguments

<value>::<NRf> specifies the Toff power spectral density value.

Returns

<NRf>

Examples

SENSe:TOFF:POWER:SPECTRAL:DENSITY? might return -83.000000000, indicating that the Toff power spectral density is set to -83 dBm.

[SENSe]:TOVerview[:MEASview<y>]:FREQuency:CENTer

Sets or queries the center frequency in the time overview.

Conditions

Measurement views: Time overview

Group

Sense commands

Syntax

```
[SENSe]:TOVerview[:MEASview<y>]:FREQuency:CENTer <value>
[SENSe]:TOVerview[:MEASview<y>]:FREQuency:CENTer?
```

Arguments

<value>::<NRf> specifies the center frequency.

Range:

- RSA5103B – 1 to 3 GHz
- RSA5106B – 1 to 6.2 GHz
- RSA5115B – 1 to 15 GHz
- RSA5126B – 1 to 26.5 GHz

Returns

<NRf>

Examples

SENSe:TOVERVIEW:MEASVIEW1:FREQUENCY:CENTER 7.5GHz sets the center frequency to 7.5 GHz.

[SENSe]:TOVerview[:MEASview<y>]:MAXTracepoints

Sets or queries the maximum trace points in the time overview.

Conditions

Measurement views: Time overview

Group

Sense commands

Syntax

```
[SENSe]:TOVerview[:MEASview<y>]:MAXTracepoints { ONEK | TENK | HUNDredk| NEVerdecimate }
[SENSe]:TOVerview[:MEASview<y>]:MAXTracepoints?
```

Arguments

ONEK sets the maximum trace points to 1 k.

TENK sets the maximum trace points to 10 k.

HUNDredk sets the maximum trace points to 100 k.

NEVerdecimate never decimates the trace points.

Returns

<NRf>

Examples

SENSe:TOVERVIEW:MEASVIEW1:MAXTRACEPOINTS TENK sets the maximum trace points to 10 k.

[SENSe]:TOVerview[:MEASview<y>]:TIME:PER:DIVision

This command sets or queries the time per division (dB/div) value in the Time Overview display.

Conditions

Measurement view: Time Overview

Group

Sense commands

Syntax

```
[SENSe]:TOVerview[:MEASview<y>]:TIME:PER:DIVision <NRf>
[SENSe]:TOVerview[:MEASview<y>]:TIME:PER:DIVision?
```

Arguments

<NRf> is the dB/div value.

Range: .01 to 20

Returns

<NR2> = floating point value without an exponent, which is the time per division value.

Examples

SENSe:TOVerview:MEASVIEW1:TIME:PER:DIV might return 10.0000000000, indicating that the time per division value is set to 10.0 dB.

[SENSe]:TOVerview[:MEASview<y>]:SELEcted:SOURce

Sets or queries the Measurement view number for the Time Overview Display.

Conditions

Measurement view: Time overview with specified Measurement view number

Source cannot be changed when acquisition or analysis is in progress. Stop the acquisition and change the Source.

Group

Sense commands

Syntax

```
[SENSe]:TOVerview[:MEASview<y>]:SELEcted:SOURce {"Source 1" | "Source 2" | "Source 3" | "Source 4"}
[SENSe]:TOVerview[:MEASview<y>]:SELEcted:SOURce?
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

<NRf>

Examples

SENSe:TOVERVIEW:MEASVIEW1:SELECTED:SOURCE? gives the Measurement view number for the Time overview source.

[SENSe]:TRACe:SPURious:COUNt:RESet (No Query Form)

Clears the multi-function (Max Hold or Average) data and counter and restarts the process in the Spurious view.

Conditions

Measurement view: Spurious Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe:SPURious:COUNt:RESet
```

Arguments

None

Returns

None

Examples

`SENSe:TRACE:SPURIOUS:COUNT:RESET` clears the multi-function data and counter and restarts the process.

[SENSe]:TRACe<x>:SPURious:COUNt

Sets and queries the count value for the selected trace in the Spurious measurement.

Conditions

Measurement view: Spurious Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe<x>:SPURious:COUNt <value>
[SENSe]:TRACe<x>:SPURious:COUNt
```

Arguments

`<x>` = 1,2,3,4 is the Trace

`<value> = < NR1>` Range is 1 to 10000

Returns

`<NR1>`

Examples

`SENSe:TRACe4:SPURious:COUNt 60` sets the count value to 60 for Trace 4.

[SENSe]:TRACe<x>:SPURious:COUNt:ENABle

Determines whether to enable or disable the count check box for the specified trace in the Spurious measurement.

Conditions

Measurement view: Spurious Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe<x>:SPURious:COUNt:ENABle {0 | OFF | 1 | ON}
[SENSe]:TRACe<x>:SPURious:COUNt:ENABle?
```

Arguments

`<x>` = 1,2,3,4 is the Trace

`ON` or `1` to enable the count check box

`OFF` or `0` to disable the count check box

Returns

<Boolean> 0, 1

Examples

SENSe:TRACe2:SPURious:COUNt:ENABle ON enables the count check box for Trace 2.

[SENSe]:TRACe<x>:SPURious:ENABle

Determines whether to enable or disable show check box for the specified trace in the Spurious measurement.

Conditions

Measurement view: Spurious Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe<x>:SPURious:ENABle {0 | OFF | 1 | ON}
[SENSe]:TRACe<x>:SPURious:ENABle?
```

Arguments

<x> = 1,2,3,4 is the Trace

ON or 1 to enable the show check box

OFF or 0 to disable the show check box

Returns

<Boolean> 0, 1

Examples

SENSe:TRACe2:SPURious:ENABle 1 enables the show check box for Trace 2.

[SENSe]:TRACe<x>:SPURious:FREeze

Determines whether to enable or disable the freeze check box for the specified trace in the Spurious measurement.

Conditions

Measurement view: Spurious Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe<x>:SPURious:FREeze {0 | OFF | 1 | ON}
[SENSe]:TRACe<x>:SPURious:FREeze?
```

Arguments

<x> = 1,2,3,4 is the Trace

ON or 1 to enable the freeze check box

OFF or 0 to disable the freeze check box

Returns

<Boolean> 0, 1

Examples

SENSe:TRACe3:SPURious:FREeze ON enables the freeze check box for Trace 3.

[SENSe]:TRACe<x>:SPURious:FUNCtion

Sets and queries the required function for the selected trace in Spurious measurement.

Conditions

Measurement view: Spurious Measurement Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe<x>:SPURious:FUNCtion {NONE | MAXH | AVER | AVGL}
[SENSe]:TRACe<x>:SPURious:FUNCtion?
```

Arguments

<x> = 1,2,3,4 is the Trace

"NONE" to select Normal

"MAXH" to select Max Hold

"AVER" to select Avg (VRMS)

"AVGL" to select Avg (of logs)

Returns

<String> NONE or MAXH or AVER or AVGL

Examples

SENSe:TRACe1:SPURious:FUNCtion NONE sets the function to Normal for Trace 1.

[SENSe]:TRACe<x>:SPURious:SELect

Sets the specified trace as the active trace in the Spurious display. The query returns the active trace.

Conditions

Measurement view: Spurious Display

Group

Sense commands

Syntax

```
[SENSe]:TRACe<x>:SPURious:SELect
[SENSe]:TRACe<x>:SPURious:SELect?
```

Arguments

<x> = 1,2,3,4 is the Trace

Returns

<Boolean> 0, 1

Examples

SENSe:TRACe2:SPURious:SELect sets Trace 2 as the active trace.

SENSe:TXGain:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the resolution bandwidth.

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:{BANDwidth|BWIDth}[:RESolution] <value>
SENSe:TXGain:{BANDwidth|BWIDth}[:RESolution]?
```

Arguments

<value>::=<NRf> specifies the RBW. Range: 1 kHz to 1 MHz.

Returns

See Arguments.

Examples

SENSe:TXGain:BANDwidth:RESolution 200E3 sets the RBW to 200 kHz.

SENSe:TXGain:FREQuency:CENTer

Sets or queries the frequency at the center of the selected Span.

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:FREQuency:CENTer <value>
SENSe:TXGain:FREQuency:CENTer?
```

Arguments

<value>::=<NRf> specifies the center frequency.

Range: 1 kHz to 1 MHz.

Returns

See Arguments.

Examples

`SENSe:TXGAIN:FREQUENCY:CENTER 1E9` sets the center frequency to 1 GHz.

SENSe:TXGain:FREQuency:POINts

Sets or queries the number of frequency steps in the measurement range.

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:FREQuency:POINts <value>
SENSe:TXGain:FREQuency:POINts?
```

Arguments

`<value>::=<NR1>` specifies number of frequency steps.

Returns

See Arguments.

Examples

`SENSe:TXGAIN:FREQUENCY:POINTS 101` sets the number of frequency steps to 101.

SENSe:TXGain:FREQuency:SPAN

Sets or queries the difference between the start and stop frequencies (span).

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:FREQuency:SPAN <value>
SENSe:TXGain:FREQuency:SPAN?
```

Arguments

`<value>::=<NR1>` specifies the frequency span.

Returns

See Arguments.

Examples

`SENSe:TXGAIN:FREQUENCY:SPAN 100E6` sets the frequency span to 100 MHz.

SENSe:TXGain:FREQuency:STARt

Sets or queries the lowest frequency in the span.

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:FREQuency:STARt <value>
SENSe:TXGain:FREQuency:STARt?
```

Related Commands

SENSe:TXGain:FREQuency:STOP (on page 2474)

Arguments

`<value>::=<NR1>` specifies the lowest frequency in the span.

Returns

See Arguments.

Examples

`SENSe:TXGAIN:FREQUENCY:START 1E9` sets the lowest frequency to 1 GHz.

SENSe:TXGain:FREQuency:STEP

Sets or queries the frequency increment. Measurements are made at frequency points from Start Freq to Stop Freq in Step Size increments.

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:FREQuency:STEP <value>
SENSe:TXGain:FREQuency:STEP?
```

Arguments

`<value>::=<NRf>` specifies the frequency increment.

Returns

See Arguments.

Examples

`SENSe:TXGAIN:FREQUENCY:STEP 1E6` sets the frequency increment to 1 MHz.

SENSe:TXGain:FREQuency:STOP

Sets or queries the highest frequency in the span.

Conditions

Measurement view: Transmission Gain

Group

Sense commands

Syntax

```
SENSe:TXGain:FREQuency:STOP <value>
SENSe:TXGain:FREQuency:STOP?
```

Related Commands

SENSe:TXGain:FREQuency:STARt (on page 2473)

Arguments

`<value>::=<NRf>` specifies the highest frequency.

Returns

See Arguments.

Examples

`SENSe:TXGAIN:FREQUENCY:STOP 2E9` sets the highest frequency to 2 GHz.

[SENSe]:USETtings (No Query Form)

Updates the analyzer settings. This command is useful when you need to set the analyzer including the RF attenuation before taking data acquisition. Unless this command is executed, the attenuation value is not set until acquisition is taken.

Conditions

Measurement views: All

Group

Sense commands

Syntax

```
[SENSe]:USETtings
```

Arguments

None

Examples

`SENSe:USETTINGS` updates settings.

[SENSe]:WLAN:AD:ANALysis:BLOCkwise:CORRection:STATe

Enables or disables the Enable Blockwise Correction check box in the Adv Params tab of the Settings control panel for the 802.11ad displays.

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:BLOCkwise:CORRection:STATe { 0 | OFF | 1 | ON }
[SENSe]:WLAN:AD:ANALysis:BLOCkwise:CORRection:STATe?
```

Arguments

`0` or `OFF` disables Blockwise Correction (unchecks check box)

`1` or `ON` enables Blockwise Correction (checks check box)

Returns

`<Boolean>` 0,1

Examples

`SENSe:WLAN:AD:ANALYSIS:BLOCKWISE:CORRECTION:STATE 1` enables Blockwise Correction.

[SENSe]:WLAN:AD:ANALysis:DC:OFFSet:CORRection:STATe

Enables or disables the Enable DC Offset Correction check box for all 802.11ad measurement views (set in the Advanced Params tab of the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:DC:OFFSet:CORRection:STATe {0 | OFF| 1 | ON }
[SENSe]:WLAN:AD:ANALysis:DC:OFFSet:CORRection:STATe?
```

Arguments

`0` or `OFF` disables Enable DC Offset Correction (unchecks check box)

`1` or `ON` enables Enable DC Offset Correction (checks check box)

Returns

`<Boolean>` 0,1

Examples

`SENSe:WLAN:AD:ANALYSIS:DC:OFFSET:CORRECTION:STATE 0` disables the Enable DC Offset Correction check box.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:CONVergence

Sets or queries the Convergence value (set in the Advanced Params tab of the Settings control panel) for the 802.11ad displays.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views.

It is applicable only when ADAPtive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:CONVergence<value>
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:CONVergence?
```

Arguments

`<value>=<NRf>`

Returns

`<NRf>`

Examples

`SENSe:WLAN:AD:ANALYSIS:EQUALIZER:CONVERGENCE?` might return `2.000E-3`, indicating the Convergence value is 2.000E-3.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:LENGth

Sets or queries the adaptive equalizer Length (set in the Advanced Params tab of the Settings control panel) for the 802.11ad displays.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views

Only applies when ADAPtive is set as the Adaptive Equalizer

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:LENGth <value>
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:LENGth?
```

Arguments

`<value>=<NR1>`

Returns

`<NR1>`

Examples

`SENSe:WLAN:AD:ANALYSIS:EQUALIZER:LENGTH 25` will set the Length to 25.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:MODE

Sets or queries the equalizer mode (set in the Advanced Params tab of the Settings control panel) for the 802.11ad displays.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views

It is applicable only when ADAPtive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:MODE {TRA | HOLD}
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:MODE?
```

Arguments

`TRA` will set the mode to Train

`HOLD` will set the mode to Hold

Returns

`<String>` = TRA or HOLD

Examples

`SENSe:WLAN:AD:ANALYSIS:EQUALIZER:MODE TRA` sets the equalizer mode to Train.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:RESet (No Query Form)

Resets the equalization value (button in the Advanced Params tab of the Settings control panel) for the 802.11ad displays.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views

Only applies when ADAPtive is set as the Adaptive Equalizer

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:RESet
```

Arguments

None

Returns

None

Examples

SENSe:WLAN:AD:ANALYSIS:EQUALIZER:RESET resets the equalization value.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TAPS

Sets or queries the Taps value in the Advanced Params tab of the Settings control panel for the 802.11ad displays.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views

Only applies when ADAPtive is set as the Adaptive Equalizer

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TAPS <value>
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TAPS?
```

Arguments

<value>=<NR1>

Returns

<NR1>

Examples

SENSe:WLAN:AD:ANALYSIS:EQUALIZER:TAPS 56 sets the Tap value to 56.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TSRatio

Sets or queries the Taps/Symbols value (set in the Advanced Params tab of the Settings control panel) for the 802.11ad displays.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views

It is applicable only when ADAPtive is set as the Adaptive Equalizer

Group

Sense commands

Syntax

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TSRatio { ONE | TWO | FOUR }

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TSRatio?

Arguments

ONE, TWO, FOUR

Returns

<String> = either ONE, TWO, or FOUR

Examples

SENSe:WLAN:AD:ANALYSIS:EQUALIZER:TSRATIO might return FOUR, indicating the Taps/Symbols value is 4.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TYPE

It sets or Queries the Equalizer to OFF, Non Adaptive Equalizer and Adaptive Equalizer in the settings control panel common to all the WLAN 802.11ad displays.

Conditions

Measurement views: All WLAN 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TYPE {NONE | NONA | ADAptive}
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TYPE?
```

Arguments

NONE will set the Equalizer to OFF.

NONA will set the Equalizer to Non Adaptive Equalizer.

ADAptive will set the Equalizer to Adaptive Equalizer.

Examples

SENSe:WLAN:AD:ANALYSIS:EQUALIZER:TYPE NONA will set the Equalizer to Non Adaptive Equalizer.

[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TYPE

Sets or queries the Equalizer type in the 802.11ad measurement views.

(If you have SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TYPE { NONE | NONA | ADAptive }
[SENSe]:WLAN:AD:ANALysis:EQUAlizer:TYPE?
```

Arguments

NONE will set the Equalizer to OFF

NONA will set the Equalizer to Non Adaptive Equalizer

ADAPtive will set the Equalizer to Adaptive Equalizer

Returns

<String> NONE or NONA or ADAPtive

Examples

SENSe:WLAN:AD:ANALYSIS:EQUALIZER:TYPE ADAptive will set the equalizer to Adaptive Equalizer.

[SENSe]:WLAN:AD:ANALysis:HANDle:MULTi:PATH:CHANnel:STATe

By enabling this flag, severe multipath can be equalized. By default this flag is set to 0.

Conditions

Measurement views: All WLAN 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:HANDle:MULTi:PATH:CHANnel:STATe {0| 1}
[SENSe]:WLAN:AD:ANALysis:HANDle:MULTi:PATH:CHANnel:STATe?
```

Arguments

0 severe multipath cannot be equalized (checkbox is unchecked)

1 severe multipath can be equalized (checkbox is checked)

Returns

0 or 1, <NRf>

Examples

SENSe:WLAN:AD:ANALYSIS:HANDLE:MULTI:PATH:CHANNEL:STATE 1 equalizes the severe multipath.

[SENSe]:WLAN:AD:ANALysis:LENGth

Specifies the length of the analysis period to be used in all the 802.11ad measurement views (set in the Analysis Time tab of the Settings control panel). The analysis length is specified in either symbols or seconds, depending on the Units setting.

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:LENGth <value>
[SENSe]:WLAN:AD:ANALysis:LENGth?
```

Arguments

<value>=<NRf>

Returns

<NRf> = analysis length. The minimum value depends on the modulation type

Examples

SENSe:WLAN:AD:ANALYSIS:LENGTH 24.7835200000E-6 sets the analysis length to 24.784 µs.

[SENSe]:WLAN:AD:ANALysis:LENGth:ACTual? (Query Only)

Returns the value of the actual analysis length for the 802.11ad measurement views (in the Analysis Time tab of the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:LENGth:ACTual?
```

Arguments

None

Returns

<NRf> = actual analysis length in seconds

Examples

SENSe:WLAN:AD:ANALYSIS:LENGTH:ACTUAL? might return 2.840E-6, indicating that the actual analysis length is 2.840 µs.

[SENSe]:WLAN:AD:ANALysis:LENGth:AUTO

Enables or disables the Auto checkbox state for analysis length in all the 802.11ad displays (set in the Analysis Time tab of the Settings control panel). This setting determines if the analysis length display is set automatically (enabled) or manually (disabled).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:LENGth:AUTO {0 | OFF | 1 | ON}
[SENSe]:WLAN:AD:ANALysis:LENGth:AUTO?
```

Arguments

0 or OFF sets the analysis length to manual (box is unchecked)

1 or ON sets the analysis length to automatic (box is checked)

Returns

<Boolean> 0,1

Examples

SENSe:WLAN:AD:ANALYSIS:LENGTH:AUTO ON sets the analysis length value automatically based on the requirements of the selected display.

[SENSe]:WLAN:AD:ANALysis:OFFSet

Sets or queries the analysis offset value in all the 802.11ad measurement displays (set in the Analysis Time tab in the Settings control panel). The query command returns the result in symbols or seconds, depending on the unit choice selected in the Analysis Time tab of the Settings control panel.

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:OFFSet <value>
[SENSe]:WLAN:AD:ANALysis:OFFSet?
```

Arguments

<value>=<NRf>

Returns

<NRf> = analysis offset

Examples

SENSe:WLAN:AD:ANALYSIS:OFFSET -1.2E-6 sets the analysis offset to -1.200 µs.

[SENSe]:WLAN:AD:ANALysis:OFFSet:AUTO

Enables or disables the Auto check box for analysis offset in all the 802.11ad measurement views (set in the Analysis Time tab of the Settings control panel). This setting determines if the analysis offset displays is set automatically (enabled) or manually (disabled).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:OFFSet:AUTO {0 | OFF | 1 | ON}
[SENSe]:WLAN:AD:ANALysis:OFFSet:AUTO?
```

Arguments

0 or OFF sets the analysis offset to disabled (box is unchecked)

1 or ON sets the analysis offset to enabled (box is checked)

Returns

<Boolean> 0,1

Examples

SENSe:WLAN:AD:ANALYSIS:OFFSET:AUTO 1 sets the analysis offset to automatic.

[SENSe]:WLAN:AD:ANALysis:SWAP:IQ

Sets or queries whether or not to swap I and Q data.

Conditions

Measurement views: All WLAN 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:SWAP:IQ {0 | 1}
[SENSe]:WLAN:AD:ANALysis:SWAP:IQ?
```

Arguments

0 does not swap I and Q data (checkbox is unchecked.)

1 swaps I and Q data (checkbox is checked.)

Returns

0 or 1, <NRf>

Examples

SENSe:WLAN:AD:ANALYSIS:SWAP:IQ 1 swaps I and Q data.

[SENSe]:WLAN:AD:ANALysis:TIMe:UNITs

Sets or queries the analysis time units for all 802.11ad measurement views (set in the Analysis Time tab of the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:ANALysis:TIMe:UNITs {SEC, SYMB}
[SENSe]:WLAN:AD:ANALysis:TIMe:UNITs?
```

Arguments

SEC sets the time units to seconds

SYMB sets the time units to symbols

Returns

See Arguments

Examples

`SENSe:WLAN:AD:ANALYSIS:TIME:UNITS SEC` sets the analysis time units to seconds.

[SENSe]:WLAN:AD(:BANDwidth|:BWIDth):MODE

Sets or queries the measurement BW mode in all the 802.11ad measurement displays (set in the Analysis Params tab in the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD(:BANDwidth|:BWIDth):MODE { MAN | AUTO | LSP}
[SENSe]:WLAN:AD(:BANDwidth|:BWIDth):MODE?
```

Arguments

`MAN` sets the mode to Manual

`AUTO` sets the mode to Auto

`LSP` sets the mode to Link to Span

Returns

See Arguments

Examples

`SENSe:WLAN:AD(:BANDWIDTH|:BWIDTH):MODE LSP` will set the Measurement BW mode to Link to Span.

[SENSe]:WLAN:AD(:BANDwidth|:BWIDth):TINTerval

Sets or queries the Measurement BW in all the 802.11ad measurement displays (set in the Analysis Params tab in the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD(:BANDwidth|:BWIDth):TINTerval <value>
[SENSe]:WLAN:AD(:BANDwidth|:BWIDth):TINTerval?
```

Arguments

`<value>=<NRf>`

Returns

<NRf> = Measurement BW value in Hz

Examples

SENSe:WLAN:AD:BANDWIDTH:TINTERVAL 5 will set the Measurement BW to 5 Hz.

[SENSe]:WLAN:AD:EVM:BURSt:COUNt

Sets or queries the total number of bursts to be analyzed (set in the EVM tab of the Settings control panel) for the display.

Conditions

Measurement views: 802.11ad Constellation, EVM vs Time, and Summary view

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:EVM:BURSt:COUNt <value>
[SENSe]:WLAN:AD:EVM:BURSt:COUNt?
```

Arguments

<value>=<NR1> Range 1 to 99

Returns

<NR1> = number of bursts

Examples

SENSe:WLAN:AD:EVM:BURST:COUNT? might return 20, indicating the total number of bursts to be analyzed is 20.

[SENSe]:WLAN:AD:EVM:BURSt:COUNt:ENABle

Enables or disables the Max Bursts to Avg check box in the EVM tab of the Settings control panel for the display.

Conditions

Measurement views: 802.11ad Constellation, EVM vs Time, and Summary view

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:EVM:BURSt:COUNt:ENABle {0 | OFF | 1 | ON }
[SENSe]:WLAN:AD:EVM:BURSt:COUNt:ENABle?
```

Arguments

0 or OFF disables the Max Bursts to Avg (unchecks check box)

1 or ON enables the Max Bursts to Avg (checks check box)

Returns

<Boolean> 0,1

Examples

SENSe:WLAN:AD:EVM:BURST:COUNT:ENABLE? might return 1, indicating the Max Bursts to Avg option is enabled.

[SENSe]:WLAN:AD:EVM:DATA:ANALyze:ALL:SYMBols

Enables or disables the Analyze All check box in the EVM tab of the Settings control panel for the display. When the Analyze All check box is enabled, all the data symbols are analyzed and the data start value is always 0.

Conditions

Measurement views: 802.11ad Constellation, EVM vs Time, and Summary view

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:EVM:DATA:ANALyze:ALL:SYMBols { 0 | OFF | 1| ON }
[SENSe]:WLAN:AD:EVM:DATA:ANALyze:ALL:SYMBols?
```

Arguments

0 or OFF disables Analyze All (unchecks check box)

1 or ON enables Analyze All (checks check box)

Returns

<Boolean> 0,1

Examples

SENSe:WLAN:AD:EVM:DATA:ANALYZE:ALL:SYMBOLS? might return 0, indicating that the Data start and Data length values are considered for current analysis.

[SENSe]:WLAN:AD:EVM:DATA:LENGth

Sets or queries the length value (set in the EVM tab of the Settings control panel) in the display.

Conditions

Measurement views: 802.11ad Constellation, EVM vs Time, and Summary view

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:EVM:DATA:LENGth <value>
[SENSe]:WLAN:AD:EVM:DATA:LENGth?
```

Arguments

<value>=<NR1>

Returns

<NR1> = length value

Examples

SENSe:WLAN:AD:EVM:DATA:LENGTH 1000, indicating that analysis should happen for 1000 symbols in the acquired data region.

[SENSe]:WLAN:AD:EVM:DATA:STARt

Sets or queries the start value (set in the EVM tab of the Settings control panel) for the display.

Conditions

Measurement views: 802.11ad Constellation, EVM vs Time, and Summary view

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:EVM:DATA:STARt <value>
[SENSe]:WLAN:AD:EVM:DATA:STARt?
```

Arguments

<value>=<NR1>

Returns

<NR1> = start value

Examples

SENSe:WLAN:AD:EVM:DATA:START 5 indicates that analysis should begin at the 5th symbol.

[SENSe]:WLAN:AD:EVM:UNITs

Sets or queries the EVM units in the EVM tab of the Settings control panel.

Conditions

Measurement views: 802.11ad Constellation, EVM vs Time, and Summary views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:EVM:UNITs { DB | PERC}
[SENSe]:WLAN:AD:EVM:UNITs?
```

Arguments

DB will set the EVM units to decibels

PERC will set the EVM units to percent

Returns

See Arguments

Examples

SENSe:WLAN:AD:EVM:UNITS PERC sets the EVM units to percent.

[SENSe]:WLAN:AD:FILTer:ALPHa

Sets or queries the Filter Parameter for all 802.11ad measurement views, which is applicable when RRC is set as the measurement filter type (in the Modulation Params tab of the Settings control panel).

Conditions

Measurement views: All WLAN 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:FILTer:ALPHa <value>
[SENSe]:WLAN:AD:FILTer:ALPHa?
```

Arguments

`<value>=<NRf>`

Returns

`<NRf>` = filter parameter

Examples

`SENSe:WLAN:AD:FILTER:ALPHA 254.0000000000E-3` will set the filter parameter to 0.254.

[SENSe]:WLAN:AD:FILTer:MEASurement

Sets or queries the measurement filter in all the 802.11ad measurement views (set in the Modulation Params tab of the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:FILTer:MEASurement { OFF | RRC }
[SENSe]:WLAN:AD:FILTer:MEASurement?
```

Arguments

`OFF` sets the filter to None

`RRC` sets the filter to Root raised cosine

Returns

See Arguments

Examples

`SENSe:WLAN:AD:FILTER:MEASUREMENT` might return `RRC`, indicating that the measurement filter is set to Root Raised Cosine.

[SENSe]:WLAN:AD:FREQuency:ERRor

Sets or queries the frequency error value in all the 802.11ad measurement views (set in the Analysis Params tab of the Settings control panel).

Conditions

Measurement views: All WLAN 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:FREQuency:ERRor <value>
[SENSe]:WLAN:AD:FREQuency:ERRor?
```

Arguments

`<value>=<NRf>`

Returns

`<NRf>` = frequency error in Hz

Examples

`SENSe:WLAN:AD:FREQUENCY:ERROR 6` will set the frequency error to 6.000 Hz.

[SENSe]:WLAN:AD:FREQuency:ERRor:AUTO

Enables or disables the Auto check box state for frequency error in all the 802.11ad displays in the Analysis Params tab of the Settings control panel. This setting determines whether the frequency error is set automatically (enabled) or manually (disabled).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:FREQuency:ERRor:AUTO { 0 | OFF | 1 | ON }
[SENSe]:WLAN:AD:FREQuency:ERRor:AUTO?
```

Arguments

`OFF` or `0` disables Frequency Error Auto (Manual mode)

`ON` or `1` enables Frequency Error Auto (Auto mode)

Returns

`<Boolean>` 0, 1

Examples

`SENSe:WLAN:AD:FREQUENCY:ERROR:AUTO OFF` disables the automatic mode for frequency error.

[SENSe]:WLAN:AD:MODUlation

Sets or queries the standard modulation type in all the 802.11ad measurement views (set in the Modulation Params tab of the Settings control panel).

Conditions

Measurement views: All 802.11ad measurement views

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:MODUlation {SC,CPHY}
[SENSe]:WLAN:AD:MODUlation?
```

Arguments

`SC` will set the standard to Single Carrier

`CPHY` will set the standard to control Phy

Returns

See Arguments

Examples

`SENSe:WLAN:AD:MODULATION SC` will set the standard modulation type to Single Carrier.

[SENSe]:WLAN:AD:SUMMary:CLEar:RESults (No Query Form)

Clears all scalar results in the display.

Conditions

Measurement view: 802.11ad Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:SUMMary:CLEar:RESults
```

Arguments

None

Returns

None

Examples

`SENSe:WLAN:AD:SUMMARY:CLEAR:RESULTS` clears the result in the 802.11ad Summary display.

[SENSe]:WLAN:AD:SUMMary:LIMIt:EVM

Sets or queries EVM limit value (set in the Limit tab in the Settings control panel) for the display. This value is the threshold for pass or fail.

Conditions

Measurement view: 802.11ad Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:SUMMary:LIMIt:EVM <Arg1,Arg2>
[SENSe]:WLAN:AD:SUMMary:LIMIt:EVM?
```

Arguments

<Arg1> = OFF or 0 (disables EVM limit) or ON or 1 (enables EVM limit)

<Arg2> = limit value (Range: 0 to –160)

Returns

<Boolean> 0,1 and <NRf> (0 to –160)

Examples

SENSe:WLAN:AD:SUMMARY:LIMIT:EVM 1,-30 enables the EVM limit and sets the limit to –30.

[SENSe]:WLAN:AD:SUMMary:LIMIt:FREQuency:ERROr

Sets or queries the frequency error limit (set in the Limit tab of the Settings control panel) for the display. This value is the threshold for pass or fail.

Conditions

Measurement view: 802.11ad Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AD:SUMMary:LIMIt:FREQuency:ERROr <Arg1,Arg2>
[SENSe]:WLAN:AD:SUMMary:LIMIt:FREQuency:ERROr?
```

Arguments

<Arg1> = OFF or 0 (disables Freq Error Limit) or ON or 1 (enables Freq Error Limit)

<Arg2> = limit value

Returns

<Boolean> 0,1

Examples

SENSe:WLAN:AD:SUMMARY:LIMIT:FREQUENCY:ERROR 0,60 disables the Freq Error Limit and sets the limit to 60.

[SENSe]:WLAN:ANALysis:LENGth

Specifies the length of the analysis period to use in the WLAN analysis time settings. Analysis length is specified in either symbols or seconds, depending on the Units setting. Use `[SENSe]:WLAN:UNIT:TIME` to set the units.

Programming a specified length sets `[SENSe]:WLAN:ANALysis:AUTO` to OFF.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:ANALysis:LENGth <NRf>
[SENSe]:WLAN:ANALysis:LENGth?
```

Arguments

Floating point number that specifies the analysis length.

Range: The minimum value depends on the modulation type.

Examples

`SENSe:WLAN:ANALYSIS:LENGTH 25.625e-6` sets the analysis length to 25.625 µs.

[SENSe]:WLAN:ANALysis:LENGth:ACTual? (Query Only)

Returns the value of the actual analysis length for the WLAN analysis time settings.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:ANALysis:LENGth:ACTual?
```

Returns

Floating point number that represents the actual analysis length in seconds.

Examples

`SENSe:WLAN:ANALYSIS:LENGTH:ACTUAL?` might return `25.625E-6`, indicating that the actual analysis length is 25.625 µs.

[SENSe]:WLAN:ANALysis:LENGth:AUTO

Sets the analysis length value based on the requirements of the selected display. To set the analysis length manually, use the command.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:ANALysis:LENGth:AUTO {0|1|OFF|ON}
[SENSe]:WLAN:ANALysis:LENGth:AUTO?
```

Arguments

`ON` or `1` sets the analysis length value based on the requirements of the selected display.

`OFF` or `0` turns this function off.

Examples

`SENSe:WLAN:ANALYSIS:LENGTH:AUTO ON` sets the analysis length value automatically based on the requirements of the selected display.

[SENSe]:WLAN:ANALysis:OFFSet

Specifies or queries the analysis offset in the symbol interval in WLAN analysis parameters. This value is a percentage of the Guard Interval. The allowable range is -100% to 0%. -100% positions the FFT to start at the beginning of the Guard Interval, 0% positions it to start at the end of the Guard Interval. The default value is -50% which usually gives the best measurement results.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:ANALysis:OFFSet <NR1>
[SENSe]:WLAN:ANALysis:OFFSet?
```

Arguments

Integer that represents the analysis offset in the symbol interval, in percent terms.

Examples

`SENSe:WLAN:ANALYSIS:OFFSET -50` sets the analysis offset in the symbol interval to -50%.

[SENSe]:WLAN:AY:ANALysis:BLOCkwise:CORRection:STATe

Set or query the state of the block wise data analysis (disabled or enabled).

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:BLOCkwise:CORRection:STATe { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:ANALysis:BLOCkwise:CORRection:STATe?
```

Arguments

`0` or `OFF` disables block wise correction.

`1` or `ON` enables block wise correction.

Returns

`0` or `OFF` means block wise correction is turned off.

`1` or `ON` means block wise correction is turned on.

Examples

`SENSe:WLAN:AY:ANAL:BLOC:CORR:STAT 1` turns on block wise correction.

`SENSe:WLAN:AY:ANAL:BLOC:CORR:STAT?` may return `0`, which means block wise correction is turned off.

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:CONVergence

Set or query the Convergence value (set in the Advanced Parameters tab of the Settings control panel) for the 802.11ay displays.

Conditions

Measurement views: All 802.11ay

It is applicable only when Adaptive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:CONVergence <value>
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:CONVergence?
```

Arguments

`<value>::=<NRf>` is the Convergence value.

Returns

`<NRf>`

Examples

`SENSe:WLAN:AY:ANAL:EQUA:CONV 2.000e-3` sets the Convergence value to 2.000e-3.

`SENSe:WLAN:AY:ANAL:EQUA:CONV?` may return `2.000e-3`, indicating the Convergence value is 2.000e-3.

[SENSe]:WLAN:AY:ANALysis:DC:OFFSet:CORRection:STATe

Set or query the state of the Enable DC Offset Correction checkbox (checked or unchecked) in the Settings control panel common to all the WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:DC:OFFSet:CORRection:STATe { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:ANALysis:DC:OFFSet:CORRection:STATe?
```

Arguments

`0` or `OFF` turns off Enable DC Offset Correction.

`1` or `ON` turns on Enable DC Offset Correction.

Returns

`0` or `OFF` means that Enable DC Offset Correction is disabled.

`1` or `ON` means that Enable DC Offset Correction is enabled.

Examples

`SENSe:WLAN:AY:ANAL:DC:OFFS:CORR:STAT 0` unchecks the Enable DC Offset Correction checkbox.

`SENSe:WLAN:AY:ANAL:DC:OFFS:CORR:STAT?` may return `1`, which means that the Enable DC Offset Correction checkbox is checked

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:LENGth

Set or query the Adaptive Equalizer Length (set in the Advanced Parameters tab of the Settings control panel) for the 802.11ay displays.

If you use SignalVu for scopes, this command is only available for the SignalVu version 3.10.0030 and above.)

Conditions

Measurement views: All 802.11ay

Only applies when adaptive is set as the adaptive equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:LENGth <value>
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:LENGth?
```

Arguments

`<value>::=<NR1>` is the Adaptive Equalizer Length value.

Returns

`<NR1>`

Examples

`SENSe:WLAN:AY:ANAL:EQUA:LENG 25` sets Adaptive Equalizer Length to 25.

SENSe:WLAN:AY:ANAL:EQUA:LENG? may return 25, which indicates that Adaptive Equalizer Length is 25.

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:MODE

Set or query the Equalizer Mode (set in the Advanced Parameters tab of the Settings control panel) for 802.11ay displays.

If you use SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.

Conditions

Measurement views: All 802.11ay

It is applicable only when Adaptive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:MODE { TRA | HOLD }
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:MODE?
```

Arguments

TRA sets mode to Train.

HOLD sets mode to Hold.

Returns

<string> = TRA or HOLD

Examples

SENSe:WLAN:AY:ANAL:EQUA:MODE TRA sets the Equalizer Mode to Train.

SENSe:WLAN:AY:ANAL:EQUA:MODE? may return HOLD, which indicates that the Equalizer Mode is Hold.

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:RESet (No Query Form)

Reset the Equalization value (button in the Advanced Parameters tab of the Settings control panel) for the 802.11ay displays.

If you use SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.

Conditions

Measurement views: All 802.11ay

It is applicable only when Adaptive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:RESet
```

Arguments

None

Examples

SENSe:WLAN:AY:ANAL:EQUA:RES resets the Equalization value.

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TAPS

Set or query the Taps value in the Advanced Parameters tab of the Settings control panel for the 802.11ay displays.

If you use SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.

Conditions

Measurement views: All 802.11ay

It is applicable only when Adaptive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TAPS <value>
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TAPS?
```

Arguments

<value>::=<NR1> is the Taps value.

Returns

<NR1>

Examples

SENSe:WLAN:AY:ANAL:EQUA:TAPS 56 sets the Taps value to 56.

SENSe:WLAN:AY:ANAL:EQUA:TAPS? may return 56, which means that the Taps value is 56.

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TSRatio

Set or query the Taps/Symbols value (set in the Advanced Parameters tab of the Settings control panel) for the 802.11ay displays.

If you use SignalVu for scopes, this command is only available for SignalVu version 3.10.0030 and above.

Conditions

Measurement views: All 802.11ay

It is applicable only when Adaptive is set as the Adaptive Equalizer.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TSRatio { ONE | TWO | FOUR }
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TSRatio?
```

Arguments

ONE, TWO, FOUR

Returns

<string> = ONE, TWO, or FOUR

Examples

SENSe:WLAN:AY:ANAL:EQUA:TSR ONE sets the Taps/Symbols value to 1.

SENSe:WLAN:AY:ANAL:EQUA:TSR? may return FOUR, indicating the value of Taps/Symbols is 4.

[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TYPE

Set or query whether the Equalizer is set to OFF, Nonadaptive (NONA), or Adaptive (ADAPtive) in the settings control panel common to all the WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TYPE { NONE | NONA | ADAPTive }
[SENSe]:WLAN:AY:ANALysis:EQUAlizer:TYPE?
```

Arguments

NONE sets the equalizer to OFF.

NONA sets the equalizer to nonadaptive.

ADAPtive sets the equalizer to adaptive.

Returns

NONE means that the equalizer is set to OFF.

NONA means that the equalizer is set to Nonadaptive.

ADAPtive means that the equalizer is set to Adaptive.

Examples

SENSe:WLAN:AY:ANAL:EQUAl:TYPE ADAPtive sets the equalizer to Adaptive

SENSe:WLAN:AY:ANAL:EQUAl:TYPE? may return NONE, which means that the equalizer is set to OFF.

[SENSe]:WLAN:AY:ANALysis:LENGth

Set or query the length value of the analysis period to be used in the WLAN 802.11ay analysis time settings.

The analysis length is specified in symbols or seconds, depending on the units setting.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:LENGth <NRf>
```

```
[SENSe]:WLAN:AY:ANALysis:LENGth?
```

Arguments

<NRf> is the floating point number that specifies the analysis length.

Range: the minimum value depends on the modulation type. Units: µs or s (seconds)

Returns

<NRf>

Examples

SENSe:WLAN:AY:ANAL:LENG 24.7835200000e-6 sets the analysis length 24.784 µs.

SENSe:WLAN:AY:ANAL:LENG? may return 24.7835200000e-6, which means that the analysis length is 24.784 µs.

[SENSe]:WLAN:AY:ANALysis:LENGth:ACTual? (Query Only)

Query the value of the actual analysis length for the WLAN 802.11ay analysis time settings.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:LENGth:ACTual?
```

Returns

<NRf>

Units: µs or s (seconds)

Examples

SENSe:WLAN:AY:ANAL:LENG:ACT? may return 2.840e-6, indicating that the actual analysis length is 2.840 µs.

[SENSe]:WLAN:AY:ANALysis:LENGth:AUTO

Set or query the state of the analysis length (enabled or disabled) based on the requirements of the selected display.

To set the analysis length value manually, use this command.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:LENGth:AUTO { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:ANALysis:LENGth:AUTO?
```

Arguments

`ON` or `1` enables analysis length.

`OFF` or `0` disables analysis length.

Returns

ON or 1 sets analysis length to automatic (box is checked).

OFF or 0 sets analysis length to manual (box is unchecked).

Examples

`SENSe:WLAN:AY:ANAL:LENG:AUTO ON` sets analysis length automatically.

`SENSe:WLAN:AY:ANAL:LENG:AUTO?` may return `OFF`, which means analysis length is turned off.

[SENSe]:WLAN:AY:ANALysis:OFFSet

Set or query the value of the Analysis Offset for all the WLAN 802.11ay displays. The value is located under the Settings control panel in all WLAN 802.11ay displays.

The query returns the result in symbols or seconds, based on the unit choice selected in the analysis time tab in the WLAN 802.11ay settings control panel.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:OFFSet <value>
[SENSe]:WLAN:AY:ANALysis:OFFSet?
```

Arguments

`<value>::=<NRf>` sets the analysis offset in the Analysis Time tab of the WLAN 802.11ay Settings control panel.

Units: µs or s (seconds)

Returns

`<NRf>`

Examples

`SENSe:WLAN:AY:ANAL:OFFS -1.2e-6` sets the Analysis Offset to -1.200 µs.

`SENSe:WLAN:AY:ANAL:OFFS?` may return `-1.2e-6`, which means that the analysis offset is -1.200 µs.

[SENSe]:WLAN:AY:ANALysis:OFFSet:AUTO

Sets or query the state of the Auto checkbox (enabled or disabled) for the analysis offset.

This setting determines if the analysis offset displays is set automatically or manually.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:OFFSet:AUTO { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:ANALysis:OFFSet:AUTO?
```

Arguments

`0` or `OFF` sets the analysis offset to manual (box is unchecked).

`1` or `ON` sets the analysis offset to automatic (box is checked).

Returns

0 or OFF means that the analysis offset is manual.

1 or ON means that the analysis offset is automatic.

Examples

`SENSe:WLAN:AY:ANAL:OFFS:AUTO 1` sets the analysis offset to automatic.

`SENSe:WLAN:AY:ANAL:OFFS:AUTO?` may return `0`, which means that the analysis offset to manual.

[SENSe]:WLAN:AY:ANALysis:SFO:TRACk:STATe

Set or query the state of the SFO Tracker. When enabled, the SFO Tracker estimates and corrects Symbol Timing/ Frequency errors for each Data/GI block. When disabled, it performs a single shot correction for the entire packet, which is based on the value estimated from the STF Region.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:SFO:TRACk:STATe { OFF | ON | 0 | 1 }
```

Arguments

`0` or `OFF` disables the SFO Tracker.

`1` or `ON` enables the SFO Tracker.

Returns

0 or OFF means the SFO Tracker is turned off.

1 or ON means the SFO Tracker is turned on.

Examples

`SENSe:WLAN:AY:ANAL:SFO:TRAC:STAT 0` turns off the SFO Tracker, performing a single shot correction for the entire data packet.

`SENSe:WLAN:AY:ANAL:SFO:TRAC:STAT?` may return `1`, which indicates that the SFO Tracker is turned on, correcting Symbol Timing and Frequency errors for each Data/GI block in the packet.

[SENSe]:WLAN:AY:ANALysis:SWAP:IQ

Set or query the sate of the Maximum Bursts to Average option (enabled or disabled) in the WLAN 802.11ay Summary setting control panel.

Conditions

Measurement views: WLAN 802.11ay Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:SWAP:IQ { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:ANALysis:SWAP:IQ?
```

Arguments

`OFF` or `0` disables Maximum Bursts to Average.

`1` or `ON` enables Maximum Bursts to Average.

Returns

0 or OFF means Maximum Bursts to Average is turned off.

1 or ON means Maximum Bursts to Average is turned on.

Examples

`SENSe:WLAN:AY:ANAL:SWAP:IQ 0` disables the IQ Swap for the WLAN 802.11ay Summary display.

`SENSe:WLAN:AY:ANAL:SWAP:IQ?` may return `1`, which indicates that the IQ Swap is enabled for the WLAN 802.11ay Summary display.

[SENSe]:WLAN:AY:ANALysis:TIMe:UNITs

Set or query the type of time units in the WLAN 802.11ay settings.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:TIMe:UNITs { SEC | SYMB }
[SENSe]:WLAN:AY:ANALysis:TIMe:UNITs?
```

Arguments

`SEC` sets time units to seconds.

`SYMB` sets time units to symbols.

Returns

`SEC` means that time units are set to seconds.

`SYMB` means that time units are set to symbols.

Examples

`SENSe:WLAN:AY:ANAL:TIM:UNIT SEC` sets time units to seconds.

`SENSe:WLAN:AY:ANAL:TIM:UNIT?` may return `SYMB`, which means that time units are set to symbols.

[SENSe]:WLAN:AY:ANALysis:TRACk:EQ:STATe

Set or query the state of the LMS Tracking Equalizer. When enabled, it performs LMS Tracking Equalization for each Data/GI block. When disabled, it provides a single shot tracking and equalization for the entire packet.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:ANALysis:TRACk:EQ:STATe { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:ANALysis:TRACk:EQ:STATe?
```

Arguments

`0` or `OFF` disables the LMS Tracking Equalizer.

`1` or `ON` enables the LMS Tracking Equalizer.

Returns

0 or OFF means the LMS Tracking Equalizer is turned off.

1 or ON means the LMS Tracking Equalizer is turned on.

Examples

`SENSe:WLAN:AY:ANAL:TRAC:EQ:STAT 1` turns on the LMS Tracking Equalizer for each Data/GI block.

`SENSe:WLAN:AY:ANAL:TRAC:EQ:STAT?` may return `0`, which indicates that the LMS Tracking Equalizer is turned off.

[SENSe]:WLAN:AY(:BANDwidth|:BWIDth):MODE

Set or query the mode of the Measurement BW in the Settings control panel common to all WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY(:BANDwidth|:BWIDth):MODE { MAN | AUTO | LSP}
[SENSe]:WLAN:AY(:BANDwidth|:BWIDth):MODE?
```

Arguments

Select one of the below arguments:

Argument	Description
MANual	Allows manual selection of the measurement bandwidth. A typical use is setting a narrow measurement bandwidth on a small range of frequencies to examine one signal, while rejecting the others that are present in a spectrum graph.
AUTO	Automatically selects a measurement bandwidth. The measurement chooses a bandwidth, based on other parameter settings, such as symbol rate and modulation type.
LSP	Sets the Measurement BW to Link to Span. This allows you to use the spectrum display to tune the frequency, view the signal, and then use span control to set the measurement bandwidth. This mode emulates legacy instruments.

Returns

See Arguments.

Examples

`SENSe:WLAN:AY:BAND:MODE LSP` sets the Measurement BW mode to Link to Span.

`SENSe:WLAN:AY:BAND:MODE?` may return `AUTO`, which means that the Measurement BW Mode automatically selects a measurement bandwidth.

[SENSe]:WLAN:AY(:BANDwidth|:BWIDth):TINTerval

Set or query the value of the Measurement Bandwidth (BW) present in the settings control panel common to all the WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY(:BANDwidth|:BWIDth):TINTerval <value>
[SENSe]:WLAN:AY(:BANDwidth|:BWIDth):TINTerval?
```

Arguments

`<value>::=<NRf>` specifies the measurement bandwidth.

Range: 1 to 100 Hz

Returns

`<NR3>`

Examples

`SENSe:WLAN:AY:BAND:BWID:TINT 5` sets the Measurement Bandwidth value to 5 Hz.

`SENSe:WLAN:AY:BAND:BWID:TINT?` may return `22`, which indicates that the Measurement Bandwidth value is 22 Hz.

[SENSe]:WLAN:AY:CHbw

Set or query the type of channel bandwidth present in the settings control panel common to all WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:CHbw { BW1X | BW2X }
[SENSe]:WLAN:AY:CHbw?
```

Arguments

`BW1X` sets the channel bandwidth to 2.16 GHz.

`BW2X` sets the channel bandwidth to 4.32 GHz.

Units: GHz

Returns

BW1X means that the channel bandwidth is 2.16 GHz.

BW2X means that the channel bandwidth is 2.16 GHz.

Examples

`SENSe:WLAN:AY:CH BW1X` sets the channel bandwidth to 2.16 GHz.

`SENSe:WLAN:AY:CH?` may return `BW2X`, which indicates that the channel bandwidth is 4.32 GHz.

[SENSe]:WLAN:AY:DUPBand

Set or query the band (Upper or Lower) that is showing the results when a nonEDMG Duplicate mode is detected with 11ay SC 4.32 GHz BW settings.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:DUPBand { LOWer | UPPer }
[SENSe]:WLAN:AY:DUPBand?
```

Arguments

`LOWer` sets the band to 2G-L for all open displays and updates the results.

`UPPer` sets the band to 2G-U for all open displays and updates the results.

Returns

`LOWer` means that the band is set to 2G-L for all open displays

`UPPer` sets the band to 2G-U for all open displays.

Examples

`SENSe:WLAN:AY:DUPB UPPer` sets the band to 2G-U for all open displays.

SENSe:WLAN:AY:DUPB? may return LOWer, which indicates that 2G-L band is set for all open displays.

[SENSe]:WLAN:AY:EVM:BURSt:COUNt

Set or query the total burst count to be analyzed.

Conditions

Measurement views: WLAN 802.11ay Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:EVM:BURSt:COUNt <value>
[SENSe]:WLAN:AY:EVM:BURSt:COUNt?
```

Arguments

<value>::=<NR1> is the total burst count.

Returns

<NR1>

Examples

SENSe:WLAN:AY:EVM:BURSt:COUN 20 sets the total burst count to be analyzed to 20.

SENSe:WLAN:AY:EVM:BURSt:COUN? may return 20, which indicates that the total burst count to be analyzed is 20.

[SENSe]:WLAN:AY:EVM:BURSt:COUNt:ENABle

Set or query the state of the Maximum Bursts to Average option (enabled or disabled) in the WLAN 802.11ay Summary setting control panel.

Conditions

Measurement views: WLAN 802.11ay Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:EVM:BURSt:COUNt:ENABle { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:EVM:BURSt:COUNt:ENABle?
```

Arguments

0 or OFF disables Maximum Bursts to Average.

1 or ON enables Maximum Bursts to Average .

Returns

0 or OFF means that Maximum Bursts to Average is turned off.

1 or ON means that Maximum Bursts to Average is turned on.

Examples

`SENSe:WLAN:AY:EVM:BURS:COUN:ENAB 0` turns off Maximum Bursts to Average option.

`SENSe:WLAN:AY:EVM:BURS:COUN:ENAB?` may return `1`, which indicates that Maximum Bursts to Average option is turned on.

[SENSe]:WLAN:AY:EVM:DATA:ANALyze:ALL:SYMBols

Set or query whether the Analyze All option is enabled or disabled. When enabled, it allows all available data symbols to be analyzed.

Data Start and Data Length values are considered for current analysis. When using standard preset, it defaults to unchecked mode.

Conditions

Measurement views: WLAN 802.11ay Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:EVM:DATA:ANALyze:ALL:SYMBols { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:EVM:DATA:ANALyze:ALL:SYMBols?
```

Arguments

`0` or `OFF` disables Analyze All.

`1` or `ON` enables Analyze All.

Returns

0 or OFF means that Analyze All is turned off.

1 or ON means that Analyze All is turned on.

Examples

`SENSe:WLAN:AY:EVM:DATA:ANAL:ALL:SYMB 1` enables data start and data length values to be considered for current analysis.

`SENSe:WLAN:AY:EVM:DATA:ANAL:ALL:SYMB?` may return `0`, indicating that data start and data length values are considered for current analysis.

[SENSe]:WLAN:AY:EVM:DATA:LENGth

Set or query whether the Analyze All checkbox is checked or unchecked. When enabled, all data symbols are analyzed and the data start value is always 0.

Conditions

Measurement views: WLAN 802.11ay Constellation, WLAN 802.11ay EVM versus Time and WLAN 802.11ay Summary displays

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:EVM:DATA:LENGth <value>
[SENSe]:WLAN:AY:EVM:DATA:LENGth?
```

Arguments

<value>::=<NR1> is the number of symbols to be analyzed.

Returns

<NR1>

Examples

SENSe:WLAN:AY:EVM:DATA:LENG 1000 sets the analysis to occur for 1000 symbols.

SENSe:WLAN:AY:EVM:DATA:LENG? may return 1000, which means that the analysis occurs for 1000 symbols.

[SENSe]:WLAN:AY:EVM:DATA:STARt

Set or query whether the Analyze All checkbox is checked or unchecked. When enabled, all data symbols are analyzed and the data start value is always 0.

Conditions

Measurement views: WLAN 802.11ay Constellation, WLAN 802.11ay EVM versus Time and WLAN 802.11ay Summary displays

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:EVM:DATA:STARt <value>
[SENSe]:WLAN:AY:EVM:DATA:STARt?
```

Arguments

<value>::=<NRf> is the symbol number.

Returns

<NRf>

Examples

SENSe:WLAN:AY:EVM:DATA:STAR 5 sets data analysis to begin at the 5th symbol.

SENSe:WLAN:AY:EVM:DATA:STAR? may return 5, which indicates that data analysis begins at the 5th symbol.

[SENSe]:WLAN:AY:EVM:UNITs

Set or query the type of EVM units (dB or percent).

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:EVM:UNITs { DB | PERC }
[SENSe]:WLAN:AY:EVM:UNITs?
```

Arguments

`DB` sets EVM units to dB.

`PERC` sets EVM units to %.

Returns

DB means that EVM units are in dB.

PERC means that EVM units are in %.

Examples

`SENSe:WLAN:AY:EVM:UNIT PERC` sets EVM units to percent (%).

`SENSe:WLAN:AY:EVM:UNIT?` may return `DB`, which indicates that EVM unit are in dB.

[SENSe]:WLAN:AY:FILTer:ALPHa

Set or query the value of the filter parameter, which is applicable when RRC is set as the measurement filter type.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:FILTer:ALPHa <value>
[SENSe]:WLAN:AY:FILTer:ALPHa?
```

Arguments

`<value>::=<NRf>` is the filter parameter value.

Returns

`<NRf>`

Examples

`SENSe:WLAN:AY:FILT:ALPH 254.0000000000e-3` sets the filter parameter value to 0.254.

`SENSe:WLAN:AY:FILT:ALPH?` may return `254.0000000000e-3`, which means that the filter parameter value is 254.0000000000e-3.

[SENSe]:WLAN:AY:FILTer:MEASurement

Set or query type of the WLAN 802.11ay measurement filter setting.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:FILTer:MEASurement { OFF | RRC }
[SENSe]:WLAN:AY:FILTer:MEASurement?
```

Arguments

`OFF` sets the measurement filter settings to None.

`RRC` sets the measurement filter settings to Root Raised Cosine.

Returns

OFF means that the measurement filter settings is set to None.

RRC means that the measurement filter settings is set to Root Raised Cosine.

Examples

`SENSe:WLAN:AY:FILT:MEAS OFF` sets the measurement filter settings to None.

`SENSe:WLAN:AY:FILT:MEAS?` may return `RRC`, which means that the measurement filter settings is Root Raised Cosine.

[SENSe]:WLAN:AY:FREQuency:ERRor

Set or query the value of the frequency error present in the Settings control panel common to all WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:FREQuency:ERRor <value>
[SENSe]:WLAN:AY:FREQuency:ERRor?
```

Arguments

`<value>::=<NRf>` is the frequency error value.

Range: -2.5 to 2.5 Hz

Returns

`<NRf>`

Examples

`SENSe:WLAN:AY:FREQ:ERR 6` sets the frequency error value to 6.000 Hz.

`SENSe:WLAN:AY:FREQ:ERR?` may return `5`, which means that the frequency error value is 5.000 Hz.

[SENSe]:WLAN:AY:FREQuency:ERRor:AUTO

Set or query the state of the Auto checkbox (enabled or disabled) for frequency errors in the settings control panel common to all WLAN 802.11ay displays.

This setting determines if the frequency error is set automatically or manually.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:FREQuency:ERRor:AUTO { OFF | ON | 0 | 1 }
[SENSe]:WLAN:AY:FREQuency:ERRor:AUTO?
```

Arguments

`OFF` or `0` disables the automatic frequency error mode (and sets the manual mode).

`ON` or `1` enables the automatic frequency error (and sets the auto mode).

Returns

OFF or 0 means that the automatic frequency error mode is disabled.

ON or 1 means that the automatic frequency error is enabled.

Examples

`SENSe:WLAN:AY:FREQ:ERR:AUTO OFF` disables the frequency error mode and sets the manual mode.

`SENSe:WLAN:AY:FREQ:ERR:AUTO?` may return `ON`, which means that the frequency error mode is automatic.

[SENSe]:WLAN:AY:MODUlation

Set or query the type of modulation present in the settings control panel that is common to all WLAN 802.11ay displays.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:MODUlation AYSC
[SENSe]:WLAN:AY:MODUlation?
```

Arguments

`AYSC` sets the standard to 802.11ay Single Carrier.

Returns

AYSC

Examples

`SENSe:WLAN:AY:MOD AYSC` sets the modulation type to Single Carrier.

`SENSe:WLAN:AY:MOD?` may return `AYSC`, which means the modulation type is Single Carrier.

[SENSe]:WLAN:AY:Region

Set or query EDMG or PreEDMG region in the Settings control panel when 11ay 4.32 GHz BW is selected.

Conditions

Measurement views: All WLAN 802.11ay

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:Region { EDMG | PRE1edmg | PRE2edmg }
[SENSe]:WLAN:AY:Region?
```

Arguments

Select one of the below arguments:

Argument	Description
EDMG	Sets the region to EDMG for all open displays.
PRE1edmg	Sets the region to PRE1edmg for all open displays.
PRE2edmg	Sets the region to PRE2edmg for all open displays.

Returns

See Arguments.

Examples

`SENSe:WLAN:AY:REG EDMG` sets the region to EDMG for all open displays when 11ay 4.32 GHz BW is selected.

`SENSe:WLAN:AY:REG?` may return `PRE1`, which indicates that the region is set to PRE1edmg for all open displays when 11ay 4.32 GHz BW is selected.

[SENSe]:WLAN:AY:SUMMary:CLEar:RESults (No Query Form)

Clears all Scalar results in the Summary display.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:SUMMary:CLEar:RESults
```

Arguments

None

Examples

`SENSe:WLAN:AY:SUMM:CLE:RES` clears all Scalar results.

[SENSe]:WLAN:AY:SUMMary:LIMIt:EVM

Set or query the EVM Limit value (arg1), which is located under the limit tab in the Summary control panel, and the EVM Limit status (arg2) as disabled or enabled.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:SUMMary:LIMIt:EVM <arg1,arg2>
[SENSe]:WLAN:AY:SUMMary:LIMIt:EVM?
```

Arguments

Number of arguments is two: `<arg1,arg2>`. Units: dB or %.

`<arg1>`:

`OFF` or `0` disables EVM Limit.

`ON` or `1` enables EVM Limit.

`<arg2>`:

Sets the limit EVM limit value to show pass/fail statuses for the EVM measurement result.

You must select the units (dB or %) in the EVM tab.

Returns

0 or 1, `<NRf>`

Examples

`SENSe:WLAN802_11ad:SUMM:LIMI:EVM 1,-30`, where `<arg1>` is 1, which indicates that Limit is enabled for the EVM Limit comparison and `<arg2>` is -30, which sets the EVM Limit value at -30%.

`SENSe:WLAN802_11ad:SUMM:LIMI:EVM?` may return `0`, which indicates that Limit is disabled for EVM Limit comparison and sets the EVM Limit value at -30 dB.

[SENSe]:WLAN:AY:SUMMary:LIMIt:FREQuency:ERROr

Set or query the Frequency Error Limit value (arg1), which is located under the limit tab in the Summary control panel, and the Frequency Error Limit status (arg2) as disabled or enabled.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Sense commands

Syntax

```
[SENSe]:WLAN:AY:SUMMary:LIMIt:FREQuency:ERROr <arg1,arg2>
[SENSe]:WLAN:AY:SUMMary:LIMIt:FREQuency:ERROr?
```

Arguments

Number of arguments is two: <arg1,arg2>. Units: ppm.

<arg1>:

OFF or 0 turns off Frequency Error Limit.

ON or 1 turns on Frequency Error Limit.

<arg2>:

Specifies show pass/fail statuses for the Frequency Error Limit value.

Returns

0 or 1, <NRf>

Examples

SENSe:WLAN:AY:SUMM:LIMI:FREQ:ERRO 1,20 where <arg1> is 1, which indicates that Limit is enabled for Frequency Error Limit comparison, and <arg2> is 20, which sets the Frequency Error Limit value at 20 ppm.

SENSe:WLAN:AY:SUMM:LIMI:FREQ:ERRO? may return 1, 20, where 1 indicates that Limit is enabled for Frequency Error Limit comparison and 20 indicates that the frequency error limit value is 20 ppm.

[SENSe]:WLAN:BURSt

Specifies the burst to measure when multiple bursts are present in an acquisition, in the WLAN analysis parameters. The index number of the first burst is 1, second burst is 2, etc.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:BURSt <NR1>
[SENSe]:WLAN:BURSt?
```

Arguments

Integer that specifies which burst to measure when multiple bursts are present in an acquisition.

Examples

SENSe:WLAN:BURST 3 sets the burst to measure in the presence of multiple bursts to the third burst.

[SENSe]:WLAN:CHANnel[:BANDwidth|:BWIDth]

Specifies or queries a nominal channel bandwidth to use for the WLAN measurements.

To automatically set the subcarrier spacing for the WLAN measurements, use the command [SENSe]:WLAN:SCARriers:SPACing:AUTO.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:CHANnel[:BANDwidth|:BWIDth] {BW5|BW10|BW20|BW40|BW80|BW160}
[SENSe]:WLAN:CHANnel[:BANDwidth|:BWIDth]?
```

Arguments

`BW5`, `BW10`, `BW20`, `BW40`, `BW80`, `BW160` specify a nominal channel bandwidth to use for the WLAN measurements.

Returns

Query returns one of the argument values indicating the selected nominal channel BW.

Examples

`SENSe:WLAN:CHANNEL:BANDWIDTH BW20` sets the nominal channel bandwidth to use to 20 MHz.

[SENSe]:WLAN:EQUalizer:TRAining

Specifies the method to use for estimating channel frequency response and equalization for WLAN measurments (either PREamble or PDATa). This control can be used to diagnose changes in frequency response over the signal packet.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:EQUalizer:TRAining {PREamble|PDATa}
[SENSe]:WLAN:EQUalizer:TRAining?
```

Arguments

`PREamble` The instrument uses only the Preamble to estimate channel frequency response. This response is then used to equalize the entire signal packet.

`PDATa` Preamble plus data. The instrument makes an initial channel frequency response estimate from the Preamble. Then it estimates the channel response for each data symbol using the decoded data content to derive equalization for each symbol individually. This allows compensation for time-varying channel response over the packet.

Examples

`SENSe:WLAN:EQUALIZER:TRAINING PREAMBLE` sets the method used to estimate channel frequency response and equalization to Preamble.

[SENSe]:WLAN:FFT:LENGth? (Query Only)

Returns the fixed FFT length for the WLAN measurements.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:FFT:LENGth?
```

Returns

Integer that represents the fixed FFT length for the WLAN measurements.

Examples

`SENSe:WLAN:FFT:LENGTH?` might return the fixed FFT length as 64.

[SENSe]:WLAN:FFT:SRATe? (Query Only)

Returns the FFT sample rate for the WLAN measurements, in samples per second, based on the bandwidth or subcarrier setting.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:FFT:SRATe?
```

Returns

Floating point number that represents the FFT sample rate in MS/s.

Examples

`SENSe:WLAN:FFT:SRATE?` might return `20.000e+6`, which represents an FFT sample rate of 20.000 MS/s.

[SENSe]:WLAN:FREQuency:ERRor

Sets or queries the frequency error in the WLAN analysis parameters. The entered value is used by the analysis as a fixed frequency offset. This is useful when

the exact frequency offset of the signal is known. To set the frequency error automatically, use the command `[SENSe]:WLAN:FREQuency:ERRor:AUTO`.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:FREQuency:ERRor <NRf>
[SENSe]:WLAN:FREQuency:ERRor?
```

Arguments

Floating point number that represents the fixed frequency offset.

Examples

`SENSe:WLAN:FREQUENCY:ERROR 0.02` sets the frequency error to 0.02.

[SENSe]:WLAN:FREQuency:ERRor:AUTO

Turns on the automatic determination of the frequency error in the WLAN analysis parameters. To enter a value manually when Auto is turned off, use the command `[SENSe]:WLAN:FREQuency:ERRor`.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:FREQuency:ERRor:AUTO {0|1|OFF|ON}
[SENSe]:WLAN:FREQuency:ERRor:AUTO?
```

Arguments

`OFF` or `0` sets the frequency error manually, using the `[SENSe]:WLAN:FREQuency:ERRor` command.

`ON` or `1` sets the frequency error automatically.

Examples

`SENSe:WLAN:FREQUENCY:ERROR:AUTO ON` turns on automatic determination of the frequency error.

[SENSe]:WLAN:GUARd:INTerval

Sets or queries the Guard Interval to use in the input signal in the WLAN measurements.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:GUARd:INTerval {AUTO|FOURth|EIGHth}
[SENSe]:WLAN:GUARd:INTerval?
```

Arguments

`AUTO` Auto from SIG uses the Guard Interval value extracted from the signal

`FOURth` specifies the guard interval as 1/4.

`EIGHth` specifies the guard interval as 1/8.

Examples

`SENSe:WLAN:GUARD:INTERVAL FOUR` sets the guard interval to 1/4.

[SENSe]:WLAN:MODulation:DETect:QAM1024

Sets or queries whether or not 1024QAM detection is enabled.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:MODulation:DETect:QAM1024 { 0 | 1 }
[SENSe]:WLAN:MODulation:DETect:QAM1024?
```

Arguments

`0` means detection is disabled.

`1` means detection is enabled.

Returns

See Arguments

Examples

`SENSe:WLAN:MODulation:MANual DSSS1` specifies to use DSSS1 fixed modulation regardless of the signal content.

[SENSe]:WLAN:MODulation:MANual

Specifies to use a fixed modulation type, regardless of the signal content, in the WLAN analysis parameters.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:MODulation:MANual {BPSK |QPSK |QAM16 |QAM64|QAM256 |QAM1024 |DSSS1 |DSSS2 |CCK5 |
   CCK11}
[SENSe]:WLAN:MODulation:MANual?
```

Arguments

`BPSK |QPSK |QAM16 |QAM64 |QAM256 |QAM1024| DSSS1 |DSSS2| CCK5 |CCK11` are fixed modulation types.

Examples

`SENSe:WLAN:MODulation:MANual DSSS1` specifies to use DSSS1 fixed modulation regardless of the signal content.

[SENSe]:WLAN:MODulation:SOURce

Specifies the method of data symbol modulation identification in the WLAN analysis parameters (either Auto Detect, Manual, or Auto from SIG).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:MODulation:SOURce [AUTO|MANual|SIG}
[SENSe]:WLAN:MODulation:SOURce?
```

Arguments

`AUTO` Auto Detect estimates the modulation from the data symbol IQ content.

`MANual` Manual allows specifying a fixed modulation type regardless of the signal content, using the command `[SENSe]:WLAN:MODulation:MANual`.

`SIG` Auto from SIG sets the modulation as indicated by the embedded SIG preamble symbol format data.

Examples

`SENSe:WLAN:MODULATION:SOURCE MANUAL` enables you to specify a fixed modulation type regardless of the signal content, using the command `[SENSe]:WLAN:MODulation:DETect:QAM1024`.

[SENSe]:WLAN:PILot:TRACking:AMPLitude:STATe

Specifies to use the pilot subcarrier to correct amplitude variations over the packet for WLAN measurements. Note: the default setting is 0 (false).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:PILot:TRACking:AMPLitude:STATe {0|1|OFF|ON}
[SENSe]:WLAN:PILot:TRACking:AMPLitude:STATe?
```

Arguments

`ON` or `1` specifies to use the Amplitude pilot subcarrier to correct amplitude variation over the packets.

`OFF` or `0` specifies that the Amplitude pilot subcarrier is off.

Examples

`SENSe:WLAN:PILOT:TRACKING:AMPLITUDE:STATE ON` specifies to use the pilot subcarrier to correct variations.

[SENSe]:WLAN:PILot:TRACking:PHASe:STATe

Specifies to use the pilot subcarrier to correct phase variations over the packet, in WLAN measurements. Note: the default setting is 1 (true).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:PILot:TRACking:PHASe:STATe {0|1|OFF|ON}
[SENSe]:WLAN:PILot:TRACking:PHASe:STATe?
```

Arguments

`ON` or `1` specifies to use the pilot subcarrier to correct phase variations over the packet.

`OFF` or `0` specifies that the pilot subcarrier is off.

Examples

`SENSe:WLAN:PILOT:TRACKING:PHASE:STATE ON` specifies to use the pilot subcarrier to correct phase variations over the packet.

[SENSe]:WLAN:PILot:TRACking:TIMing:STATe

Specifies to use the pilot subcarrier to correct timing variations over the packet, in WLAN measurements. Note: the default setting is 0 (false).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:PILot:TRACking:TIMing:STATe {0|1|OFF|ON}
[SENSe]:WLAN:PILot:TRACking:TIMing:STATe?
```

Arguments

`ON` or `1` specifies to use the pilot subcarrier to correct timing variations over the packet.

`OFF` or `0` specifies that the pilot subcarrier is off.

Examples

`SENSe:WLAN:PILOT:TRACKING:TIMING:STATE ON` specifies to use the pilot subcarrier to correct timing variations over the packet.

[SENSe]:WLAN:RADix

Specifies or queries the format for displaying the symbol values in the WLAN setting preferences (either binary or HEX).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:RADix {BINary|HEX}
[SENSe]:WLAN:RADix?
```

Arguments

`BINary` specifies to display the symbol values in binary format.

`HEX` specifies to display the symbol values in HEX format.

Examples

`SENSe:WLAN:RADIX HEX` specifies to display the symbol values in HEX format.

[SENSe]:WLAN:SCARriers

Sets or queries which subcarriers to display in the WLAN view.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SCARriers {ALL|PILots|DATA|RANGEe|SINGle}
[SENSe]:WLAN:SCARriers?
```

Arguments

`ALL` specifies that all subcarriers will be displayed.

`PILot` specifies that only the pilot subcarriers will be displayed.

`DATA` specifies that only the data subcarriers will be displayed.

`RANGe` specifies that the subcarriers within a specified range will be displayed.

`SINGle` specifies that only a single subcarrier will be displayed.

Examples

`SENSe:WLAN:SCARRIERS ALL` sets the WLAN view to display all subcarriers.

[SENSe]:WLAN:SCARriers:RANGe:STARt

Sets or queries the start value of the subcarrier range to be displayed in the WLAN view.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SCARriers:RANGe:STARt <NR1>
[SENSe]:WLAN:SCARriers:RANGe:STARt?
```

Arguments

Integer

Examples

`SENSe:WLAN:SCARRIERS:RANGE:START 20` sets the subcarrier start range to 20.

[SENSe]:WLAN:SCARriers:RANGe:STOP

Sets or queries the stop value of the subcarrier range to be displayed in the WLAN view.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SCARriers:RANGe:STOP <NR1>
[SENSe]:WLAN:SCARriers:RANGe:STOP?
```

Arguments

Integer

Examples

`SENSe:WLAN:SCARRIERS:RANGE:STOP 25` sets the subcarrier stop range to 25.

[SENSe]:WLAN:SCARriers:SINGle:INDex

Specifies or queries the single subcarrier to display in the WLAN view.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SCARriers:SINGle:INDex <NR1>
[SENSe]:WLAN:SCARriers:SINGle:INDex?
```

Arguments

Integer

Examples

`SENSe:WLAN:SCARRIERS:SINGLE:INDEX -10` sets the single subcarrier for display to -10.

[SENSe]:WLAN:SCARriers:SPACing

Sets or queries the subcarrier spacing in the WLAN measurements.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SCARriers:SPACing <NRf>
[SENSe]:WLAN:SCARriers:SPACing?
```

Arguments

`NR3` is a floating point number that specifies the subcarrier spacing.

Returns

`SENSe:WLAN:SCARRIERs:SPACING 312.5E+3` sets the subcarrier spacing to 312.5 kHz.

[SENSe]:WLAN:SCARriers:SPACing:AUTO

When turned on, automatically sets the subcarrier spacing in the WLAN measurements.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SCARriers:SPACing:AUTO {0|1|OFF|ON}
[SENSe]:WLAN:SCARriers:SPACing:AUTO?
```

Arguments

`OFF` or `0` turns the automatic subcarrier spacing off.

`ON` or `1` turns the automatic subcarrier spacing on.

Examples

`SENSe:WLAN:SCARriers:SPACing:AUTO ON` turns the automatic subcarrier spacing on.

[SENSe]:WLAN:SIGNal:STANdard:TYPE

Sets or queries the WLAN signal standard.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Additionally, the N argument requires Option 24, and the AC argument requires Option 25.

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SIGNal:STANdard:TYPE {A|B|G|J|P|N|AC}
[SENSe]:WLAN:SIGNal:STANdard:TYPE?
```

Arguments

`A` sets the WLAN signal standard to 802.11a.

`B` sets the WLAN signal standard to 802.11b.

`G` sets the WLAN signal standard to 802.11g.

`J` sets the WLAN signal standard to 802.11j.

`P` sets the WLAN signal standard to 802.11p.

`N` sets the WLAN signal standard to 802.11n. Requires Option 24 in addition to Option 23.

`AC` sets the WLAN signal standard to 802.11ac. Requires Option 25 in addition to Option 23.

Examples

`SENSe:WLAN:SIGNAL:STANdARD:TYPE G` sets the WLAN signal standard to 802.11g.

[SENSe]:WLAN:SubCARrier:DERotation

Turning on this state allows some displays to show subcarriers with or without the Gamma subcarrier phase rotation removed. Gamma phase rotation is applied to 802.11n and 802.11ac subcarriers in defined subranges depending on the Channel Bandwidth selected (only for Channel Bandwidths of 40 MHz and above).

When derotation is turned off, the rotation is not removed, which provides a direct view of the physical modulation on the channel. With derotation turned on, the rotation is removed, allowing easier decoding of the underlying data content.

Only the Constellation and Symbol Table results are affected by this control.

NOTE: This control is only shown for 802.11n and 802.11ac standard selections for channel bandwidths greater than or equal to 40 MHz. It is not present for all others.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SubCARrier:DERotation {0|1|OFF|ON}
[SENSe]:WLAN:SubCARrier:DERotation?
```

Arguments

`OFF` or 0 turns the subcarrier derotation off.

`ON` or 1 turns the subcarrier derotation on.

Examples

`SENSe:WLAN:SUBCARRIER:DEROTATION ON` turns the subcarrier derotation on.

[SENSe]:WLAN:SUMMary:CLEar:RESults (No Query Form)

Clears the results in the WLAN Summary measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SUMMary:CLEar:RESults
```

Arguments

None

Examples

`SENSe:WLAN:SUMMARY:CLEAR:RESULTS` clears the results in the measurement.

[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt

Specifies the maximum number of bursts to average for the WLAN Summary EVM display. The burst average function must be enabled using the command `[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt:ENABle`.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt <NR1>
[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt?
```

Arguments

Integer

Examples

`SENSe:WLAN:SUMMary:EVM:RMS:AVERage:COUNt 12` sets the maximum number of bursts to average to 12.

[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt:ENABle

Enables the burst average function in the WLAN Summary EVM settings. To specify the maximum number of bursts to average, use the command `[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt`.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt:ENABle {0|1|OFF|ON}
[SENSe]:WLAN:SUMMary:EVM:RMS:AVERage:COUNt:ENABle?
```

Arguments

`ON` or `1` turns the burst average function on.

`OFF` or `0` turns the burst average function off.

Examples

`SENSe:WLAN:SUMMARY:EVM:RMS:AVERAGE:COUNT:ENABLE ON` turns the burst average function on.

[SENSe]:WLAN:SWAP:IQ

Specifies to swap the I and Q components of a signal in the WLAN analysis parameters. Doing so compensates the input signal for spectral inversion.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SWAP:IQ {0|1|OFF|ON}
[SENSe]:WLAN:SWAP:IQ?
```

Arguments

`OFF` or `0` turns the Swap I and Q function off.

`ON` or `1` turns the Swap I and Q function on.

Examples

`SENSe:WLAN:SWAP:IQ ON` swaps the I and Q components of the signal.

[SENSe]:WLAN:SYMBols|CHIPs

Specifies or queries which symbols or chips are displayed in the WLAN Symbol Table.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards. The DAT, PRAM and HEAD enumerations apply to 802.11b only.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs {ALL|RANGe|SINGle|DAT|PRAM|HEAD}
[SENSe]:WLAN:SYMBols|CHIPs?
```

Arguments

`ALL` specifies that all symbols or chips will be displayed.

`RANGe` specifies that a range of symbols or chips will be displayed.

`SINGle` specifies that single symbols or chips will be displayed.

`DAT` specifies that the Data symbols or chips will be displayed. Applies to 802.11b only.

`PRAM` specifies that Preamble symbols or chips will be displayed. Applies to 802.11b only.

`HEAD` specifies that Header symbols or chips will be displayed. Applies to 802.11b only.

Examples

`SENSe:WLAN:SYMBOLS ALL` specifies that all symbols or chips will be displayed in the WLAN Symbol Table.

[SENSe]:WLAN:SYMBols|CHIPs:MAX

Sets or queries the value for the maximum number of symbols/chips to analyze for the WLAN Symbol Table.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs:MAX <NR1>
[SENSe]:WLAN:SYMBols|CHIPs:MAX?
```

Arguments

Integer

Examples

`SENSe:WLAN:SYMBOLS:MAX 50` specifies a maximum value of 50 symbols to analyze for the WLAN Symbol Table.

[SENSe]:WLAN:SYMBols|CHIPs:MAX:STATe

Turns on or off the “maximum data symbols to analyze” feature for the WLAN Symbol Table. To specify the maximum number of symbols/chips to analyze, use the command.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs:MAX:STATe {0|1|OFF|ON}
[SENSe]:WLAN:SYMBols|CHIPs:MAX:STATe?
```

Arguments

`ON` or `1` turns on the “maximum data symbols to analyze” feature.

`OFF` or `0` disables the “maximum data symbols to analyze” feature.

Examples

`SENSe:WLAN:SYMBOLS:MAX:STATE ON` turns on “maximum data symbols to analyze” feature for the WLAN Symbol Table.

[SENSe]:WLAN:SYMBols|CHIPs:RANGe:COUNt

Sets or queries the number of symbols or chips to display when displaying a range results in the WLAN Symbol Table.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs:RANGe:COUNt <NR1>
[SENSe]:WLAN:SYMBols|CHIPs:RANGe:COUNt?
```

Arguments

Integer that represents the number of symbols/chips to displayl

Examples

`SENSe:WLAN:SYMBOLS:RANGE:COUNT 4` sets the number of symbols or chips to display to 4 in the WLAN Symbol Table.

[SENSe]:WLAN:SYMBols|CHIPs:RANGe:STARt

Sets or queries the symbols/chips start value when displaying a range of results in the WLAN Symbol Table.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs:RANGe:STARt <NR1>
[SENSe]:WLAN:SYMBols|CHIPs:RANGe:STARt?
```

Arguments

Integer

Examples

`SENSe:WLAN:SYMBOLS:RANGE:START 40` sets the start value of the range to 40.

[SENSe]:WLAN:SYMBols|CHIPs:RANGe:STOP

Sets or queries the symbols or chips stop value when displaying a range of results in the WLAN Symbol Table.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs:RANGe:STOP <NR1>
[SENSe]:WLAN:SYMBols|CHIPs:RANGe:STOP?
```

Arguments

Integer

Examples

`SENSe:WLAN:SYMBOLS:RANGE:STOP 60` sets the stop value of the range to 60.

[SENSe]:WLAN:SYMBols|CHIPs:SINGle:INDex

Sets or queries the symbol or chip to use when displaying results from a single symbol in the WLAN Symbol Table.

Use `CHIPs` for 802.11b and `SYMBols` for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:SYMBols|CHIPs:SINGle:INDex <NR1>
[SENSe]:WLAN:SYMBols|CHIPs:SINGle:INDex?
```

Arguments

Integer

Examples

`SENSe:WLAN:CHIPs:SINGle:INDex 26` specifies to display symbol 26.

[SENSe]:WLAN:UNIT:FREQuency

Specifies or queries whether the displayed frequency units are frequency (Hz) or subcarrier in the WLAN settings.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:UNIT:FREQuency {FREQuency|SCARrier}
[SENSe]:WLAN:UNIT:FREQuency?
```

Arguments

`FREQuency` specifies that the displayed frequency units will be Hz.

`SCARrier` specifies that the displayed frequency units will be subcarrier.

Examples

`SENSe:WLAN:UNIT:FREQUENCY FREQ` specifies that the frequency units in the display will be Hz.

[SENSe]:WLAN:UNIT:TIME

Specifies or queries whether the displayed time units are seconds, symbols or chips in the WLAN settings. Chips is only a valid option for 802.11b, and Symbols is valid for all other standards.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Sense commands

Syntax

```
[SENSe]:WLAN:UNIT:TIME {SEConds|SYMBols|CHIPs}
[SENSe]:WLAN:UNIT:TIME?
```

Arguments

`SEConds` specifies that the displayed time units are to be seconds

`SYMBols` specifies that the displayed time units are to be symbols

`CHIPs` specifies that the displayed time units are to be chips (valid only for 802.11b)

Examples

`SENSe:WLAN:UNIT:TIME SYMBOLS` specifies that the displayed time units are to be symbols.

SOURce:TXGain:POWer

Sets or queries the output power level of the tracking generator.

Conditions

Measurement view: Transmission Gain

Group

Source commands

Syntax

```
SOURce:TXGain:POWer <value>
```

Arguments

`<value>::=<NRf>` is the tracking generator output power.

Range: –3 dBm to –43 dBm.

Returns

See Arguments.

Examples

`SOURCE:TXGAIN:POWER -10` sets the tracking generator output power to –10 dBm.

*SRE

Sets or queries the value of the Service Request Enable Register (SRER).

Refer to Status and Events (on page 2796) for the register information.

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

```
*SRE <value>
*SRE?
```

Related Commands

*CLS (on page 713)

*ESE (on page 1109)

*ESR? (on page 1109)

*STB? (on page 2532)

Arguments

<value>::<NR1> is a value in the range from 0 to 255.

The binary bits of the SRER are set according to this value.

Using an out-of-range value causes an execution error.

Examples

*SRE48 sets binary 00110000 in the bits of the SRER.

*SRE? might return 32, indicating that binary value 00100000 has been set in the bits of the SRER.

*STB? (Query Only)

Returns the contents of the Status Byte Register (SBR) in the status/event reporting structure using the Master Summary Status (MSS) bit. Refer to Status and Events (on page 2796) for the register information.

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

```
*STB?
```

Related Commands

*CLS (on page 713)

*ESE (on page 1109)

*ESR? (on page 1109)

*SRE (on page 2531)

Arguments

None

Returns

<NR1> representing the contents of the SBR as a decimal number.

Examples

*STB? might return 96, indicating that the SBR contains binary 0110 0000.

Status commands

STATus:ACPower:EVENts? (Query Only)

Returns the current events and status conditions for the Channel power and ACPR measurement.

Conditions

Measurement views: Channel power and ACPR

Group

Status commands

Syntax

STATus:ACPower:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:ACPOWER:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:{AM|FM|PM}:EVENts? (Query Only)

Returns the current events and status conditions for the AM/FM/PM measurement.

Conditions

Measurement views: AM, FM, PM

Group

Status commands

Syntax

STATus:{AM|FM|PM}:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:AM:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually in the AM measurement.

STATus:AUDio:SPECtrum:EVENts? (Query Only)

Returns the current events and status conditions for the audio measurement.

Conditions

Measurement views: Audio Spectrum

Group

Status commands

Syntax

STATus:AUDio:SPECtrum:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where:

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:AUDIO:SPECTRUM:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:AUDio:SUMMary:EVENts? (Query Only)

Returns the current events and status conditions for the audio measurement.

Conditions

Measurement views: Audio Summary

Group

Status commands

Syntax

`STATus:AUDio:SUMMary:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where:

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event.

If there is no error, the response is 0, "No events to report".

Examples

`STATUS:AUDIO:SUMMARY:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:AVTime[:MEASview<y>]:EVENts? (Query Only)

Returns the current events and status conditions for the Amplitude versus Time measurement.

Conditions

Measurement views: Amplitude versus Time

Group

Status commands

Syntax

`STATus:AVTime[:MEASview<y>]:EVENts?`

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:AVTIME:MEASVIEW1:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually for Amplitude versus Time Measurement View 1.

STATus:BIBEmissions:EVENts? (Query Only)

Returns the current events and status conditions for the Bluetooth InBand Emission measurement.

Conditions

Measurement views: Bluetooth InBand Emission

Group

Status commands

Syntax

STATus:BIBEmissions:EVENts?

Arguments

None

Returns

<ecode>, "<edesc>[,<einfo>]"{,"<edesc>[,<einfo>]"}

Where:

<ecode> ::= <NR1> is the error/event code (-32768 to 32767).

<edesc> ::= <string> is the description on the error/event.

<einfo> ::= <string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:BIBEMISSIONS:EVENTS? might return 0 indicating no events to report.

STATus:BLUEtooth:CONSte:EVENts? (Query Only)

Returns the current events and status conditions for the Bluetooth Constellation measurement.

Conditions

Measurement views: Bluetooth Constellation

Group

Status commands

Syntax

STATus:BLUEtooth:CONSte:EVENts?

Arguments

None

Returns

<ecode>, "<edesc>[<einfo>]"{, <ecode>,"<edesc>[<einfo>]"}

Where

<ecode> ::= <NR1> is the error/event code (-32768 to 32767).

<edesc> ::= <string> is the description of the error/event.

<einfo> ::= <string> is the additional information of the error/event.

Examples

STATus:BLUEtooth:CONSte:EVENts? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:BLUEtooth:EDIAgram:EVENts? (Query Only)

Returns the current events and status conditions for the eye diagram measurement.

Conditions

Measurement views: Bluetooth Eye Diagram

Group

Status commands

Syntax

STATus:BLUEtooth:EDIAgram:EVENts?

Arguments

None

Returns

<ecode>, "<edesc>[<einfo>]"{, <ecode>,"<edesc>[<einfo>]"}

Where

<ecode> ::= <NR1> is the error/event code (-32768 to 32767).

<edesc> ::= <string> is the description of the error/event.

<einfo> ::= <string> is the additional information of the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATus:BLUEtooth:EDIAgram:EVENts? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:BLUEtooth:FDVTime:EVENts? (Query Only)

Returns the current events and status conditions for the Frequency Deviation versus Time measurement.

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Status commands

Syntax

`STATus:BLUEtooth:FDVTime:EVENts?`

Arguments

None

Returns

`<ecode>, "<edesc>[,<einfo>]"{,"<edesc>[,<einfo>]"}`

Where:

`<ecode> ::= <NR1>` is the error/event code (-32768 to 32767).

`<edesc> ::= <string>` is the description on the error/event.

`<einfo> ::= <string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATus:BLUEtooth:FDVTime:EVENts?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:BLUEtooth:SUMMary:EVENts (Query Only)

Returns the current events and Status conditions for the Bluetooth Summary measurements.

Conditions

Measurement view: Bluetooth Summary display

Group

Status commands

Syntax

`STATus:BLUEtooth:SUMMary:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}` where

`<ecode>:: <NR1>` is the error/event code (-32768 to 32767).

`<edesc>:: <String>` is the description of the error/event.

`<einfo>:: <String>` is the additional information on the error/event If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:BLUETOOTH:SUMMARY:EVENTS?` might return `12026, "Acq Sampling params: manual control"`.

STATus:CCDF:EVENts? (Query Only)

Returns the current events and status conditions for the CCDF measurement.

Conditions

Measurement views: CCDF

Group

Status commands

Syntax

```
STATus:CCDF:EVENts?
```

Arguments

None

Returns

```
<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}
```

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:CCDF:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:CONSte[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the constellation measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Status commands

Syntax

```
STATus:CONSte[:MEASview<y>]:EVENts?
```

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error or event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

STATus:CONSTe:MEASview2:EVENts? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually for measview 2 of constellation.

STATus:DIQVtime[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the Demod I&Q versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Status commands

Syntax

STATus:DIQVtime[:MEASview<y>]:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error or event code (-32768 to 32767).

<edesc>::<string> is the description on the error or event.

<einfo>::<string> is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

STATus:DIQVtime:MEASview1:EVENts? might return 12026, "Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually for measurement view 1.

STATus:DPX:EVENts? (Query Only)

Returns the current events and status conditions for the DPX, Spectrum measurement.

Conditions

Measurement views: DPX, Spectrum

Group

Status commands

Syntax

`STATus:DPX:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:DPX:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:EDIagram[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the eye diagram measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Status commands

Syntax

`STATus:EDIagram[:MEASview<y>]:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error or event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error or event.

<einfo>::<string> is the additional information on the error or event.

If there is no error, the response is 0, "No events to report".

Examples

STATus:EDIagram:MEASview2:EVENts? might return 12026, "Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:EMC:EVENts? (Query Only)

Returns the current events and status conditions for the EMC display.

Conditions

Measurement view: EMC - EMI Display

Group

Status commands

Syntax

STATus:EMC:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:EMC:EVENTS? might return 11037,"Ext corrections enabled for traces."

STATus:EVM[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the EVM versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod EVM versus Time).

Group

Status commands

Syntax

`STATus:EVM[:MEASview<y>]:EVENts?`

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

`<ecode>::<NR1>` is the error or event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error or event.

`<einfo>::<string>` is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

`STATus:EVM:MEASview2:EVENts?` might return `12026, "Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:FDVTime[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the Frequency deviation versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Frequency deviation versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Frequency deviation versus Time).

Group

Status commands

Syntax

`STATus:FDVTime:MEASview<y>:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error or event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error or event.

`<einfo>::<string>` is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:FDVTIME:MEASview2:EVENTS?` might return `12026, "Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:{FSETtling|PSETtling}:EVENts? (Query Only)

Returns the current events and status conditions for the specified settling time measurement.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Status commands

Syntax

`STATus:{FSETtling|PSETtling}:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:{FSETTLING|PSETTLING}:EVENTS?` might return `2048,"Done saving - restart with Stop, then Run"`, indicating that the acquisition has been completed.

STATus:FVTime[:MEASview<y>]:EVENts? (Query Only)

Returns the current events and status conditions for the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Status commands

Syntax

`STATus:FVTime[:MEASview<y>]:EVENts?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:FVTIME:MEASview1:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:IQVTime[:MEASview<y>]:EVENts? (Query Only)

Returns the current events and status conditions for the RF I&Q versus Time measurement.

Conditions

Measurement views: RF I&Q versus Time

Group

Status commands

Syntax

STATus:IQVTime[:MEASview<y>]:EVENts?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:IQVTIME:MEASview1:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:LTE:ACLR:EVENts? (Query Only)

Returns the current events and status conditions for the LTE ACLR measurement.

Conditions

Measurement view: LTE ACLR

Group

Status commands

Syntax

`STATus:LTE:ACLR:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description of the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:LTE:ACLR:EVENTS?` might return `12006, "Not aligned",2008,"Not calibrated",12007,"unaligned data",12009,"Data from uncalibrated instrument"`.

STATus:LTE:CHSPectrum:EVENts? (Query Only)

Returns the current events and status conditions for the LTE Channel Spectrum measurement.

Conditions

Measurement view: LTE Channel Spectrum

Group

Status commands

Syntax

`STATus:LTE:CHSPectrum:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description of the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:LTE:CHSPECTRUM:EVENTS?` might return `12006,"Not aligned",2008,"Not calibrated"`.

STATus:LTE:CONSte:EVENts? (Query Only)

Returns the current events and status condition for the LTE Constellation measurement.

Conditions

Measurement view: LTE Constellation

Group

Status commands

Syntax

`STATus:LTE:CONSte:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description of the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:LTE:CONSTE:EVENTS?` might return `12006,"Not aligned",2008,"Not calibrated",11090,"Recovery done on PSS/SSS on the center 62, "106 - AnaSynchronization Sequence not found"`.

STATus:LTE:PVTime:EVENts? (Query Only)

Returns the current events and status conditions for the LTE Power vs Time measurement.

Conditions

Measurement view: LTE Power vs Time

Group

Status commands

Syntax

`STATus:LTE:PVTime:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description of the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:LTE:PVTIME:EVENTS?` might return `12006,"Not aligned",2008,"Not calibrated"`.

STATus:MCPower:EVENts? (Query Only)

Returns the current events and status conditions for the MCPR (multi-carrier ACPR) measurement.

Conditions

Measurement views: MCPR

Group

Status commands

Syntax

`STATus:MCPower:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:MCPOWER:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:MERRor[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the Magnitude error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Magnitude error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Status commands

Syntax

`STATus:MERRor[:MEASview<y>]:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error or event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error or event.

<einfo>::<string> is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:MERRor:MEASview2:EVENTS? might return 12026, "Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:OBWidth:EVENts? (Query Only)

Returns the current events and status conditions for the Occupied Bandwidth (OBW) measurement.

Conditions

Measurement views: Occupied Bandwidth

Group

Status commands

Syntax

STATus:OBWidth:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:OBWIDTH:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:OFDM:CONSte:EVENts? (Query Only)

Returns the current events and status condition for the OFDM Constellation measurement.

Conditions

Measurement views: OFDM

Group

Status commands

Syntax

STATus:OFDM:CONSte:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:OFDM:CONSTE:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:OFDM:EVM:EVENts? (Query Only)

Returns the current events and status condition for the OFDM EVM (Error Vector Magnitude) versus Time measurement.

Conditions

Measurement views: OFDM

Group

Status commands

Syntax

STATus:OFDM:EVM:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:OFDM:EVM:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:OFDM:MERRor:EVENts? (Query Only)

Returns the current events and status condition for the OFDM Magnitude versus Time measurement.

Conditions

Measurement views: OFDM

Group

Status commands

Syntax

`STATus:OFDM:MERRor:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:OFDM:MERROR:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:OFDM:PERRor:EVENts? (Query Only)

Returns the current events and status condition for the OFDM Phase error versus Time measurement.

Conditions

Measurement views: OFDM

Group

Status commands

Syntax

`STATus:OFDM:PERRor:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:OFDM:PERROR:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:OFDM:POWer:EVENts? (Query Only)

Returns the current events and status condition for the OFDM Power measurement.

Conditions

Measurement views: OFDM

Group

Status commands

Syntax

`STATus:OFDM:POWer:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:OFDM:POWER:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:OFDM:STABle:EVENts? (Query Only)

Returns the current events and status condition for the OFDM Symbol table measurement.

Conditions

Measurement views: OFDM

Group

Status commands

Syntax

`STATus:OFDM:STABle:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:OFDM:STABLE:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:OPERation:CONDition? (Query Only)

Returns the contents of the Operation Condition Register (OCR).

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:OPERation:CONDition?
```

Arguments

None

Returns

<NR1> is a decimal number showing the contents of the OCR.

Examples

STATUS:OPERATION:CONDITION? might return 16, showing that the bits in the OCR have the binary value 0000000000010000, which means the analyzer is in measurement.

STATus:OPERation:ENABle

Sets or queries the enable mask of the Operation Enable Register (OENR) which allows true conditions in the Operation Event Register to be reported in the summary bit.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:OPERation:ENABle <bit_value>
STATus:OPERation:ENABle?
```

Arguments

<bit_value>::<NR1> is the enable mask of the OENR. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the OENR. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

STATUS:OPERATION:ENABLE1 enables the ALIGning bit.

STATUS:OPERATION:ENABLE? might return 1, showing that the bits in the OENR have the binary value 00000000 00000001, which means that the ALIGning bit is valid.

STATus:OPERation[:EVENt]? (Query Only)

Returns the contents of the Operation Event Register (OEVR). Reading the OEVR clears it.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:OPERation[:EVENt]?
```

Arguments

None

Returns

<NR1> is a decimal number showing the contents of the OEVR.

Examples

STATUS:OPERATION:EVENT? might return 1, showing that the bits in the OEVR have the binary value 00000000 00000001, which means that the ALIGning bit is set.

STATus:OPERation:NTRansition

Sets or queries the negative transition filter value of the Operation Transition Register (OTR).

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:OPERation:NTRansition <bit_value>
STATus:OPERation:NTRansition?
```

Arguments

<bit_value>::<NR1> is the negative transition filter value. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the OTR. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

STATUS:OPERATION:NTRANSITION#H0011 sets the negative transition filter value to #H0011.

STATUS:OPERATION:NTRANSITION? might return 17.

STATus:OPERation:PTRansition

Sets or queries the positive transition filter value of the Operation Transition Register (OTR).

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:OPERation:PTRansition <bit_value>
STATus:OPERation:PTRansition?
```

Arguments

<bit_value>::<NR1> is the positive transition filter value. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the OTR. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

STATUS:OPERATION:PTRANSITION 0 sets the positive transition filter value to 0.

STATUS:OPERATION:PTRANSITION? might return 0.

STATus:P25:EDIagram:EVENts? (Query Only)

Returns the current events and status conditions for the P25 Eye Diagram display.

Conditions

Measurement view: P25 Eye Diagram

Group

Status commands

Syntax

```
STATus:P25:EDIagram:EVENts?
```

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where:

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description of the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:P25:EDIAGRAM:EVENTS? might return 12026,"Acq Sampling Parma's: Manual control", indicating that the sampling parameters are controlled Manually.

STATus:P25:SUMMary:EVENts (Query Only)

Returns the current events and status conditions for the Summary measurement.

Conditions

Measurement views: P25 Summary

This command requires P25 Measurements.

Group

Status commands

Syntax

STATus:P25:SUMMary:EVENts

Arguments

None

Returns

<ecode>,"<edesc>[<einfo]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description of the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

STATUS:P25:SUMMARY:EVENTS? might return 12026 "Acquisition Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:PERRor[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the Phase error versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Status commands

Syntax

`STATus:PERRor[:MEASview<y>]:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error or event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error or event.

`<einfo>::<string>` is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

`STATus:PERRor:MEASview2:EVENts?` might return `12026, "Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually for measurement view 2.

STATus:PHVTime[:MEASview<y>]:EVENts? (Query Only)

Returns the current events and status conditions for the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Status commands

Syntax

`STATus:PHVTime[:MEASview<y>]:EVENts?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:PHVTIME:MEASview1:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:PNOise:EVENts? (Query Only)

Returns the current events and status conditions for the phase noise measurement.

Conditions

Measurement views: Spurious

Group

Status commands

Syntax

`STATus:PNOise:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:PNOISE:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:PRESet (No Query Form)

Presets the SCPI enable registers and transition registers.

Conditions

Measurement views: All

Group

Status commands

Syntax

`STATus:PRESet`

Arguments

None

Examples

`STATUS:PRESET` presets the SCPI enable registers and transition registers.

STATus:PULSe:CUMulative:HISTogram[:MEASview<y>]:EVENts (Query Only)

Returns the current events and status conditions for the Cumulative Histogram display.

Conditions

Measurement views: Cumulative Histogram with the specified Measurement View Number

Group

Status commands

Syntax

`STATus:PULSe:CUMulative:HISTogram[:MEASview<y>]:EVENts?`

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<ecode>,"<edesc>[<einfo]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description of the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

`STATus:PULSe:CUMulative:HISTogram:MEASview1:EVENTS?` might return `0,"No events to report"`.

STATus:PULSe:CUMulative:STATistics[:MEASview<y>]:EVENts (Query Only)

Returns the current events and status conditions for the Cumulative Statistics display.

Conditions

Measurement views: Pulse Cumulative Statistics

Group

Status commands

Syntax

`STATus:PULSe:CUMulative:STATistics[:MEASview<y>]:EVENts?`

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`<ecode>,"<edesc>[<einfo]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description of the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

STATus:PULSe:CUMulative:STATistics:MEASview1:EVENts? might return 0,"No events to report".

STATus:PULSe:OGRAm[:MEASview<y>]:EVENts (Query Only)

Returns the current events and status conditions for the Pulse-Ogram display.

Conditions

Measurement views: Pulse-Ogram

Group

Status commands

Syntax

STATus:PULSe:OGRAm[:MEASview<y>]:EVENts?

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

<ecode>,"<edesc>[<einfo]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description of the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, then response is 0, “No events to report.”

Examples

STATus:PULSe:OGRAm:MEASview1:EVENts? might return 0,"No events to report".

STATus:PULSe:RESult:EVENts? (Query Only)

Returns the current events and status conditions for the pulse table measurement.

Conditions

Measurement views: Pulse table

Group

Status commands

Syntax

STATus:PULSe:RESult:EVENts?

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:PULSE:RESULT:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:PULSe:STATistics[:MEASview<y>]:EVENts? (Query Only)

Returns the current events and status conditions for the pulse statistics measurement.

Conditions

Measurement views: Pulse statistics

Group

Status commands

Syntax

STATus:PULSe:STATistics[:MEASview<y>]:EVENts?

Arguments

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATus:PULSe:STATistics:MEASview1:EVENts? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:PULSe:TRACe[:MEASview<y>]:EVENts

Returns the current events and status conditions for the pulse trace measurement.

Conditions

Measurement views: Pulse trace with specified Measurement view number

Group

Status commands

Syntax

`STATus:PULSe:TRACe[:MEASview<y>]:EVENts?`

Arguments

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:PULSE:TRACE:MEASVIEW1:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually on pulse trace measurement view 1.

STATus:QUEStionable:CALibration:CONDition? (Query Only)

Returns the contents of the questionable calibration condition register.

Conditions

Measurement views: All

Group

Status commands

Syntax

`STATus:QUEStionable:CALibration:CONDition?`

Arguments

None

Returns

`<NR1>` is a decimal number showing the contents of the questionable calibration condition register.

Examples

STATUS:QUESTIONABLE:CALIBRATION:CONDITION? might return 16384, showing that the bits in the questionable calibration condition register have the binary value 01000000 00000000, which means the Alignment Needed bit is set.

STATus:QUEStionable:CALibration:ENABle

Sets or queries the enable mask of the questionable calibration enable register which allows true conditions in the questionable calibration event register to be reported in the summary bit.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:CALibration:ENABle <bit_value>
STATus:QUEStionable:CALibration:ENABle?
```

Arguments

<bit_value>::<NR1> is the enable mask of the questionable calibration enable register. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the questionable calibration enable register. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

STATUS:QUESTIONABLE:CALIBRATION:ENABLE 16384 enables the Alignment Needed bit.

STATUS:QUESTIONABLE:CALIBRATION:ENABLE? might return 16384, showing that the bits in the questionable calibration enable register have the binary value 01000000 00000000, which means that the Calibration Summary bit is valid.

STATus:QUEStionable:CALibration[:EVENt]? (Query Only)

Returns the contents of the questionable calibration event register. Reading the register clears it.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:CALibration[:EVENt]?
```

Arguments

None

Returns

<NR1> is a decimal number showing the contents of the questionable calibration event register.

Examples

STATUS:QUESTIONABLE:CALIBRATION:EVENT? might return 16384, showing that the bits in the questionable calibration event register have the binary value 01000000 00000000, which means that the Calibration Summary bit is set.

STATus:QUEStionable:CALibration:NTRansition

Sets or queries the negative transition filter value of the questionable calibration transition register.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:CALibration:NTRansition <bit_value>
STATus:QUEStionable:CALibration:NTRansition?
```

Arguments

<bit_value>::<NR1> is the negative transition filter value. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the questionable calibration transition register. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

STATUS:QUESTIONABLE:CALIBRATION:NTRANSITION #H4000 sets the negative transition filter value to #H4000.

STATUS:QUESTIONABLE:CALIBRATION:NTRANSITION? might return 16384.

STATus:QUEStionable:CALibration:PTRansition

Sets or queries the positive transition filter value of the questionable calibration transition register.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:CALibration:PTRansition <bit_value>
STATus:QUEStionable:CALibration:PTRansition?
```

Arguments

<bit_value>::<NR1> is the positive transition filter value. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the questionable calibration transition register. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

`STATUS:QUESTIONABLE:CALIBRATION:PTRANSITION 0` sets the positive transition filter value to 0.

`STATUS:QUESTIONABLE:CALIBRATION:PTRANSITION?` might return `0`.

STATus:QUEStionable:CONDition? (Query Only)

Returns the contents of the Questionable Condition Register (QCR).

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:CONDition?
```

Arguments

None

Returns

`<NR1>` is a decimal number showing the contents of the QCR.

Examples

`STATUS:QUESTIONABLE:CONDITION?` might return `256`, showing that the bits in the QCR have the binary value 00000001 00000000, which means the Calibration Summary bit is set.

STATus:QUEStionable:ENABle

Sets or queries the enable mask of the Questionable Enable Register (QENR) which allows true conditions in the Questionable Event Register to be reported in the summary bit.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:ENABle <bit_value>
STATus:QUEStionable:ENABle?
```

Arguments

`<bit_value>::<NR1>` is the enable mask of QENR. Range: 0 to 65535.

Returns

`<NR1>` is a decimal number showing the contents of the QENR. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

`STATUS:QUESTIONABLE:ENABLE 256` enables the Calibration Summary bit.

STATUS:QUESTIONABLE:ENABLE? might return 256, showing that the bits in the QENR have the binary value 00000001 00000000, which means that the Calibration Summary bit is valid.

STATus:QUEStionable[:EVENt]? (Query Only)

Returns the contents of the Questionable Event Register (QEVR). Reading the QEVR clears it.

Conditions

Measurement views: All

Group

Status commands

Syntax

STATus:QUEStionable[:EVENt]?

Arguments

None

Returns

<NR1> is a decimal number showing the contents of the QEVR.

Examples

STATUS:QUESTIONABLE:EVENT? might return 256, showing that the bits in the QEVR have the binary value 00000001 00000000, which means that the Calibration Summary bit is set.

STATus:QUEStionable:FREQuency:CONDition? (Query Only)

Returns the contents of the questionable frequency condition register.

Conditions

Measurement views: All

Group

Status commands

Syntax

STATus:QUEStionable:FREQuency:CONDition?

Arguments

None

Returns

<NR1> is a decimal number showing the contents of the questionable frequency condition register.

Examples

STATUS:QUESTIONABLE:FREQUENCY:CONDITION? might return 512, showing that the bits in the questionable frequency condition register have the binary value 00000010 00000000, which means the Locked To External Ref bit is set.

STATus:QUEStionable:FREQuency:ENABle

Sets or queries the enable mask of the questionable frequency enable register which allows true conditions in the questionable frequency event register to be reported in the summary bit.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:FREQuency:ENABle <bit_value>
STATus:QUEStionable:FREQuency:ENABle?
```

Arguments

<bit_value>::<NR1> is the enable mask of the questionable frequency enable register. Range: 0 to 65535.

Returns

<NR1> is a decimal number showing the contents of the questionable frequency enable register. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

STATUS:QUESTIONABLE:FREQUENCY:ENABLE 512 enables the Locked To External Ref bit.

STATUS:QUESTIONABLE:FREQUENCY:ENABLE? might return 512, showing that the bits in the questionable calibration enable register have the binary value 00000010 00000000, which means that the Locked To External Ref bit is valid.

STATus:QUEStionable:FREQuency[:EVENt]? (Query Only)

Returns the contents of the questionable frequency event register. Reading the register clears it.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:FREQuency[:EVENt]?
```

Arguments

None

Returns

<NR1> is a decimal number showing the contents of the questionable frequency event register.

Examples

STATUS:QUESTIONABLE:FREQUENCY:EVENT? might return 512, showing that the bits in the questionable frequency event register have the binary value 00000010 00000000, which means that the Locked To External Ref bit is set.

STATus:QUEStionable:FREQuency:NTRansition

Sets or queries the negative transition filter value of the questionable frequency transition register.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:FREQuency:NTRansition <bit_value>
STATus:QUEStionable:FREQuency:NTRansition?
```

Arguments

`<bit_value>::<NR1>` is the negative transition filter value. Range: 0 to 65535.

Returns

`<NR1>` is a decimal number showing the contents of the questionable frequency transition register. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

`STATUS:QUESTIONABLE:FREQUENCY:NTRANSITION #H0200` sets the negative transition filter value to #H0200.

`STATUS:QUESTIONABLE:FREQUENCY:NTRANSITION?` might return `512`.

STATus:QUEStionable:FREQuency:PTRansition

Sets or queries the positive transition filter value of the questionable frequency transition register.

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:FREQuency:PTRansition <bit_value>
STATus:QUEStionable:FREQuency:PTRansition?
```

Arguments

`<bit_value>::<NR1>` is the positive transition filter value. Range: 0 to 65535.

Returns

`<NR1>` is a decimal number showing the contents of the questionable frequency transition register. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

`STATUS:QUESTIONABLE:FREQUENCY:PTRANSITION 0` sets the positive transition filter value to 0.

`STATUS:QUESTIONABLE:FREQUENCY:PTRANSITION?` might return `0`.

STATus:QUEStionable:NTRansition

Sets or queries the negative transition filter value of the Questionable Transition Register (QTR).

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:NTRansition <bit_value>
STATus:QUEStionable:NTRansition?
```

Arguments

`<bit_value>::<NR1>` is the negative transition filter value. Range: 0 to 65535.

Returns

`<NR1>` is a decimal number showing the contents of the QTR. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

`STATUS:QUESTIONABLE:NTRANSITION #H0020` sets the negative transition filter value to #H0020.

`STATUS:QUESTIONABLE:NTRANSITION?` might return `32`.

STATus:QUEStionable:PTRansition

Sets or queries the positive transition filter value of the Questionable Transition Register (QTR).

Conditions

Measurement views: All

Group

Status commands

Syntax

```
STATus:QUEStionable:PTRansition <bit_value>
STATus:QUEStionable:PTRansition?
```

Arguments

`<bit_value>::<NR1>` is the positive transition filter value. Range: 0 to 65535.

Returns

`<NR1>` is a decimal number showing the contents of the QTR. Range: 0 to 32767 (The most-significant bit cannot be set true.)

Examples

`STATUS:QUESTIONABLE:PTRANSITION 0` sets the positive transition filter value to 0.

`STATUS:QUESTIONABLE:PTRANSITION?` might return `0`.

STATus:SEM:EVENts? (Query Only)

Returns the current events and status conditions for the Spectral Emissions Mask measurement.

Conditions

Measurement views: Spectral Emissions Mask

Group

Status commands

Syntax

`STATus:SEM:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:SEM:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:SGRAM[:MEASview<y>]:EVENts (Query Only)

Returns the current events and status conditions for the spectrogram measurement.

Conditions

Measurement views: Spectrogram

Group

Status commands

Syntax

`STATus:SGRAM[:MEASview<y>]:EVENts?`

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATus:SGRAM:MEASview1:EVENts? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:SPECtrum[:MEASview<y>]:EVENts? (Query Only)

Returns the current events and status conditions and status conditions for the spectrum measurement.

Conditions

Measurement views: Spectrum

Group

Status commands

Syntax

STATus:SPECtrum[:MEASview<y>]:EVENts?

Arguments

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:SPECTRUM:MEASVIEW2:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:SPURious:EVENts ? (Query Only)

Returns the current events and status conditions for the Spurious measurement.

Conditions

Measurement view: Spurious Display

Group

Status commands

Syntax

```
STATus:SPURious:EVENts ?
```

Arguments

None

Returns

```
<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}
```

where

`<ecode>:: <NR1>` is the error/event code (-32768 to 32767).

`<edesc>:: <String>` is the description of the error/event.

`<einfo>:: <String>` is the additional information on the error/event If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:SPURIOUS:EVENTS?` might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:SQUality[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the signal quality measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Signal quality

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Signal quality).

Group

Status commands

Syntax

```
STATus:SQUality[:MEASview<y>]:EVENts?
```

Arguments

None

Returns

```
<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}
```

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATus:SQUality:MEASview1:EVENts?` might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually for measurement view1.

STATus:TDIagram[:MEASview<y>]:EVENts? (Query only)

Returns the current events and status conditions for the trellis diagram measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Trellis diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Trellis diagram).

Group

Status commands

Syntax

`STATus:TDIagram[:MEASview<y>]:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error or event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error or event.

`<einfo>::<string>` is the additional information on the error or event. If there is no error, the response is 0, "No events to report".

Examples

`STATus:TDIagram:MEASview2:EVENts?` might return 12026, "Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:TXGain:EVENts? (Query Only)

Queries events for the Transmission Gain display.

Conditions

Measurement view: Transmission Gain

Group

Status commands

Syntax

`STATus:TXGain:EVENts?`

Returns

Examples

`STATUS:TXGAIN:EVENTS?`

STATus:WLAN:AD:CONSte:EVENts? (Query Only)

Queries the current events and status conditions for the Constellation measurement display.

Conditions

Measurement view: 802.11ad Constellation

Group

Status commands

Syntax

`STATus:WLAN:AD:CONSte:EVENts?`

Arguments

None

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

where

`<ecode>:: <NR1>` is the error/event code (-32768 to 32767).

`<edesc>:: <String>` is the description of the error/event.

`<einfo>:: <String>` is the additional information on the error/event If there is no error, then response is 0, “No events to report.”

Examples

`STATUS:WLAN:AD:CONSTE:EVENTS?` might return 12056,"Warm-up period", indicating the error code is 12056 and the description of that error code is “Warm up period”.

STATus:WLAN:AD:EVM:EVENts? (Query Only)

Returns the current events and status conditions for the EVM vs Time measurement.

Conditions

Measurement views: 802.11ad EVM vs Time

Group

Status commands

Syntax

`STATus:WLAN:AD:EVM:EVENts?`

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

where

<ecode>:: <NR1> is the error/event code (-32768 to 32767).

<edesc>:: <String> is the description of the error/event.

<einfo>:: <String> is the additional information on the error/event If there is no error, then response is 0, “No events to report.”

Examples

STATUS:WLAN:AD:EVM:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:WLAN:AD:SUMMary:EVENts (Query Only)

Returns the current events and status conditions for the 802.11ad Summary display.

Conditions

Measurement view: 802.11ad Summary

Group

Status commands

Syntax

STATus:WLAN:AD:SUMMary:EVENts

Arguments

None

Returns

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

where

<ecode>:: <NR1> is the error/event code (-32768 to 32767).

<edesc>:: <String> is the description of the error/event.

<einfo>:: <String> is the additional information on the error/event If there is no error, then response is 0, “No events to report.”

Examples

STATUS:WLAN:AD:SUMMARY:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:WLAN:AY:CONSte:EVENts? (Query Only)

Query the current Events and Status conditions in the Constellation display.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Status commands

Syntax

`STATus:WLAN:AY:CONSte:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]",{<ecode>,"<edesc>[:<einfo>]"}`

where:

`<ecode>::=<NR1>` is the error/event code (Range: -32768 to 32767)

`<edesc>::=<string>` is the description of the error/event.

`<einfo>::=<string>` is the additional information on the error/event. If there are no errors, then the response will be 0, “No events to report.”

Examples

`STAT:WLAN:AY:CONS:EVEN?` may return `12026, "Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:WLAN:AY:EVM:EVENts? (Query Only)

Query the current events and status conditions for the EVM versus time measurement.

Conditions

Measurement views: 802.11ay Analysis EVM

Group

Status commands

Syntax

`STATus:WLAN:AY:EVM:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

where:

`<ecode>::=<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::= <string>` is the description of the error/event.

`<einfo>::=<string>` is the additional information on the error/event. If there are no errors, the response is 0, “No events to report”.

Examples

`STAT:WLAN:AY:EVM:EVEN?` may return `12026, "Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:WLAN:AY:SUMMary:EVENts? (Query Only)

Query the current Events and Status conditions for the Summary measurement view.

Conditions

Measurement view: 802.11ay Analysis Summary

Group

Status commands

Syntax

```
STATus:WLAN:AY:SUMMary:EVENts?
```

Returns

```
<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}
```

where:

`<ecode>::=<NR1>` is the Error/Event Code. Range: -32768 to 32767.

`<edesc>::=<string>` is the Description of the Error/Event.

`<einfo>::=<string>` is the additional information about the Error/Event. If there are no errors, then the response is 0, “No events to report”.

Examples

`STAT:WLAN:AY:SUMM:EVEN?` may return `12026, "Acq Sampling Params: manual control"`, indicating that sampling parameters are controlled manually.

STATus:WLAN:CONSte:EVENts? (Query Only)

Returns the current instrument status concatenated with WLAN constellation-specific event information.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

```
STATus:WLAN:CONSte:EVENts?
```

Returns

ASCII string representation of instrument status as follows:

```
<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}
```

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:WLAN:CONSTE:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:WLAN:CRESponse:EVENts? (Query Only)

Returns the current events and status conditions for the WLAN Channel Response display.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

`STATus:WLAN:CRESponse:EVENts?`

Returns

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:WLAN:CRES:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:WLAN:EVM:EVENts? (Query Only)

Returns the current instrument status concatenated with WLAN EVM-specific event information.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

`STATus:WLAN:EVM:EVENts?`

Returns

ASCII string representation of instrument status as follows:

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:WLAN:EVM:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:WLAN:MERRor:EVENts? (Query Only)

Returns the current instrument status concatenated with WLAN Magnitude Error-specific event information.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

STATus:WLAN:MERRor:EVENts?

Returns

<ecode,"<edesc[<einfo]"{,<ecode,"<edesc[:<einfo]"}

Where:

<ecode:: <NR1> is the error/event code (-32768 to 32767).

<edesc:: <string> is the description on the error/event.

<einfo:: <string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:WLAN:MERR:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:WLAN:PERRor:EVENts? (Query Only)

Returns instrument status concatenated with WLAN Phase Error-specific event information.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

STATus:WLAN:PERRor:EVENts?

Returns

ASCII string representation of instrument status as follows:

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

STATUS:WLAN:PERR:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:WLAN:PVTime:EVENts? (Query Only)

Returns the current instrument status concatenated with WLAN Power vs. Time-specific event information.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

ASCII string representation of instrument status as follows:

<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}

Where

<ecode>::<NR1> is the error/event code (-32768 to 32767).

<edesc>::<string> is the description on the error/event.

<einfo>::<string> is the additional information on the error/event.

If there is no error, the response is 0, "No events to report".

Examples

STATUS:WLAN:PVT:EVENTS? might return 12026,"Acq Sampling Params: manual control", indicating that the sampling parameters are controlled manually.

STATus:WLAN:STABle:EVENts? (Query Only)

Returns instrument status concatenated with WLAN Symbol Table-specific event information.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

STATus:WLAN:STABle:EVENts?

Returns

ASCII string representation of instrument status as follows:

`<ecode>,"<edesc>[<einfo>]"{,<ecode>,"<edesc>[:<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event. If there is no error, the response is 0, "No events to report".

Examples

`STATUS:WLAN:STABLE:EVENTS?` might return `12026,"Acq Sampling Params: manual control"`, indicating that the sampling parameters are controlled manually.

STATus:WLAN:SUMMary:EVENts? (Query Only)

Returns the current events and status conditions for the WLAN summary measurement.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Status commands

Syntax

`STATus:WLAN:SUMMary:EVENts?`

Arguments

None

Returns

`<ecode>, "<edesc>[<einfo>]" {, <ecode>, "<edesc>[<einfo>]"}`

Where

`<ecode>::<NR1>` the error/event code (-32768 to 32767).

`<edesc>::<string>` the description on the error/event.

`<einfo>::<string>` the additional information on the error/event. If there is no error, the response is `0, "No events to report"`.

Returns the contents of the Status Byte Register (SBR) in the status/event reporting structure using the Master Summary Status (MSS) bit. Refer to Status and Events (on page 2796), for the register information.

System commands

SYSTem:ANTenna:AMPLifier? (Query Only)

Queries the status of the antenna amplifier.

Conditions

Requires an RSA306B/500A/600A instrument with an antenna.

Group

System commands

Syntax

`SYSTem:ANTenna:AMPLifier?`

Returns

`1` or `ON` means amplifier is on.

`0` or `OFF` means amplifier is off.

SYSTem:ANTenna:CAPabilities:REPort? (Query Only)

Queries the selected antenna capabilities for the items.

Conditions

Requires an RSA306B/500A/600A instrument with an antenna.

Group

System commands

Syntax

`SYSTem:ANTenna:CAPabilities:REPort?`

Returns

ReportsNothing = 1, ReportsAzimuth = 2, ReportsElevation = 4,

ReportsActiveMode = 8, ReportsBandChange = 16, ReportsRollAngle = 32,

ReportsButtonPresses = 64

Examples

`SYSTEM:ANTENNA:CAPABILITIES:REPORT?` might return `126` when the set to Simulator. This is 64+32+16+8+4+2.

`SYSTEM:ANTENNA:CAPABILITIES:REPORT?` might return `6`, which indicates capabilities of azimuth and elevation reporting.

SYSTem:ANTenna:CATalog? (Query Only)

Queries the catalog of antennas. Use the SYSTem:ANTenna:SELected command to select an antenna from the catalog.

Conditions

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

`SYSTem:ANTenna:CATalog?`

Returns

<string>,<string> is a list of antennas in the catalog.

Examples

SYSTEM:ANTENNA:CATALOG? might return "Alaris DF-A0047","Simulator".

SYSTem:ANTenna:CONNect (No Query Form)

Initiates antenna connection.

Conditions

Requires antenna or antenna simulator mode. Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

SYSTem:ANTenna:CONNect { 1 | 0 }

Arguments

1 or ON connects antenna.

0 or OFF does not connect antenna.

SYSTem:ANTenna:DATA? (Query Only)

Queries the true north azimuth, uncorrected compass bearing, elevation, and roll values of the antenna.

Conditions

Antenna mode must be set to Simulator to report roll value.

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

SYSTem:ANTenna:DATA?

Related Commands

SYSTem:ANTenna:SETDATA (on page 2588)

Returns

<numeric>::<NR3>

<numeric>,<numeric>,<numeric>,<numeric>

Examples

SYSTEM:ANTENNA:DATA? might return 65.6509800000,54.2109800000,37.8086400000, indicating the true north azimuth is 65.6°, the uncorrected compass bearing is 54.2°, and the elevation is 37.8°.

SYSTem:ANTenna:DECLination? (Query Only)

Queries current calculated declination.

Conditions

Requires an RSA306B/500A/600A instrument with an antenna.

Group

System commands

Syntax

```
SYSTem:ANTenna:DECLination?
```

Returns

<NR2> is the calculated declination.

Examples

`SYSTEM:ANTENNA:DECLINATION?` might return `10.0`, indicating that the calculated declination is 10.0°.

SYSTem:ANTenna:DECLination:USER

Sets or queries the manually entered declination.

Conditions

Requires an RSA306B/500A/600A instrument with an antenna.

Group

System commands

Syntax

```
SYSTem:ANTenna:DECLination:USER <NR2>
SYSTem:ANTenna:DECLination:USER?
```

Related Commands

SYSTem:ANTenna:DECLination:USER:STATe (on page 2584)

Arguments

`<NR2>` is the manually entered declination.

Returns

`<NR2>` is the manually entered declination.

Examples

`SYSTEM:ANTENNA:DECLINATION:USER?` might return `10.0000000000`, indicating that the manually forced declination is set to 10.0°.

SYSTem:ANTenna:DECLination:USER:STATe

Sets or queries to force declination.

Conditions

Requires an RSA306B/500A/600A instrument with an antenna.

Group

System commands

Syntax

```
SYSTem:ANTenna:DECLination:USER:STATe { 1 | 0 | ON | OFF }
SYSTem:ANTenna:DECLination:USER:STATe?
```

Related Commands

SYSTem:ANTenna:DECLination:USER (on page 2584)

Arguments

`1` or `ON` forces the declination to a user entered value.

`0` or `OFF` sets the declination to not be forced.

Returns

1 or ON means the declination is set to a manually entered value.

0 or OFF means the declination is not forced.

SYSTem:ANTenna:FREQuency:BAND? (Query Only)

Queries the currently selected frequency band for the antenna, assuming that it has the ability to report back which band is selected.

Conditions

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:ANTenna:FREQuency:BAND?
```

Returns

It returns 0 for all currently available antennas (and the Simulator), because they do not have the ability to report back which band is selected.

Examples

```
SYSTEM:ANTENNA:FREQUENCY:BAND?
```

SYSTem:ANTenna:MANufacturer? (Query Only)

Queries the antenna manufacturer.

Conditions

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax
`SYSTem:ANTenna:MANufacturer?`

Returns
`<string>`

Examples
`SYSTEM:ANTENNA:MANUFACTURER?` might return `"Alaris"`.

SYSTem:ANTenna:MODel? (Query Only)
Queries the antenna model.

Conditions
Requires an RSA306B/500A/600A instrument.

Group
System commands

Syntax
`SYSTem:ANTenna:MODel?`

Returns
`<string>`

Examples
`SYSTEM:ANTENNA:MODEL?` might return `"DF-A0047"`.

SYSTem:ANTenna:OPTions? (Query Only)
Queries the antenna options.

Conditions
Requires an RSA306B/500A/600A instrument.

Group
System commands

Syntax
`SYSTem:ANTenna:OPTions?`

Returns
`<string>`

Examples
`SYSTEM:ANTENNA:OPTIONS?` might return `"None"`.

SYSTem:ANTenna:SELected

Sets or queries the selected antenna.

Conditions

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:ANTenna:SELected <string>
SYSTem:ANTenna:SELected?
```

Related Commands

SYSTem:ANTenna:CATalog? (on page 2582)

Arguments

`<string>` is an item from the antenna catalog.

`Alaris DF-A0047` sets analyzer to Alaris antenna. Simulator sets the analyzer to the simulated antenna.

Returns

“None” means the analyzer is set to no antenna.

“Alaris DF-A0047” means the analyzer is set to the Alaris antenna. “Simulator” means the analyzer is set to the simulated antenna.

Examples

`SYSTEM:ANTENNA:SELECTED?` might return `"Alaris DF-A0047"`, indicating that the antenna selection is set to the Alaris DF-A0047.

SYSTem:ANTenna:SERial? (Query Only)

Queries the antenna serial number.

Conditions

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:ANTenna:SERial?
```

Returns

`<string>`

Examples

`SYSTEM:ANTENNA:SERIAL?` might return `"A22500"`.

SYSTem:ANTenna:SETDATA (No Query Form)

Sets the amplifier, true north azimuth, uncorrected compass bearing, elevation, and roll values of the antenna.

Conditions

Antenna mode must be set to Simulator to report roll value.

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:ANTenna:SETDATA <boolean>,<numeric>,<numeric>,<numeric>,<numeric>
```

Related Commands

SYSTem:ANTenna:DATA? (on page 2583)

Arguments

<boolean> is { 1 | 0 | ON | OFF }

```
<numeric>::<NR3>
```

Examples

`SYSTEM:ANTENNA:SETDATA 1,65.6509800000,54.2109800000,37.8086400000` will set the amplifier to ON (1), the true north azimuth to 65.6°, the uncorrected compass bearing to 54.2°, and the elevation to 37.8°.

SYSTem:BATTery:CCYCle? (Query Only)

Queries the battery charge cycle.

Conditions

Requires an RSA500A series instrument with a battery installed.

Group

System commands

Syntax

```
SYSTem:BATTery:CCYCle?
```

Returns

Returns the number of charge cycles of the battery.

Examples

`SYSTEM:BATTERY:CCYCLE?` might return `10`, indicating that the battery has been charged 10 times.

SYSTem:BATTery:DATE? (Query Only)

Queries the battery manufactured date.

Conditions

Requires an RSA500A series instrument with a battery installed.

Group

System commands

Syntax

`SYSTem:BATTery:DATE?`

Returns

Returns the date string as yyyy-mm-dd.

Examples

`SYSTEM:BATTERY:DATE?` might return `"2015-10-05"`, indicating the battery manufactured date is October 5, 2015.

SYSTem:BATTery:RCHarge? (Query Only)

Queries the relative charge remaining.

Conditions

Requires an RSA500A series or RSA600A series instrument with a battery installed.

Group

System commands

Syntax

`SYSTem:BATTery:RCHarge?`

Returns

Returns the relative charge remaining in percent.

Examples

`SYSTEM:BATTERY:RCHARGE?` might return `50`, indicating the relative charge remaining is 50%.

SYSTem:BATTery:SERial? (Query Only)

Queries the battery serial number.

Conditions

Requires an RSA500A series instrument with a battery installed.

Group

System commands

Syntax

`SYSTem:BATTery:SERial?`

Returns

Returns the battery serial number.

Examples

`SYSTEM:BATTERY:SERIAL?` might return `1234`, indicating the serial number is 1234.

SYSTem:BATTery:STATus? (Query Only)

Queries the battery status.

Conditions

Requires an RSA500A series instrument with a battery installed.

Group

System commands

Syntax

`SYSTem:BATTery:STATus?`

Returns

`ACFull` means AC present and fully charged

`ACCHarging` means AC present and charging

`ACNBattery` means AC present and no battery

`FULL` means battery fully charged

`EMPTy` means battery fully discharged DISCharging battery discharging ERRor battery error

Examples

`SYSTEM:BATTERY:STATUS?` might return ACNB, indicating no battery is installed.

SYSTem:BATTery:TEMPerature? (Query Only)

Queries the battery temperature.

Conditions

Requires an RSA500A series instrument with a battery installed.

Group

System commands

Syntax

`SYSTem:BATTery:TEMPerature?`

Returns

Returns the battery temperature in degrees Celsius.

Examples

`SYSTEM:BATTERY:TEMPERATURE?` might return `15`, indicating that the battery temperature is 15 °C.

SYSTem:COMMunicate:GPIB[:SELF]:ADDRess

Sets or queries the GPIB address of the instrument.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:COMMunicate:GPIB[:SELF]:ADDRess <value>
SYSTem:COMMunicate:GPIB[:SELF]:ADDRess?
```

Arguments

<value>::<NR1> specifies the GPIB address of the instrument.

*RST has no effect on the value.

Examples

SYSTEM:COMMUNICATE:GPIB:SELF:ADDRESS 18 sets the GPIB address to 18.

SYSTem:DATE

Sets or queries the date (year, month, and day). This command is equivalent to the date setting through the Windows Control Panel.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:DATE <year>,<month>,<day>
SYSTem:DATE?
```

Related Commands

SYSTem:TIME (on page 2618)

Arguments

<year>::<NRf> specifies the year (4 digits). Range: 2000 to 2099.

<month>::<NRf> specifies the month. Range: 1 (January) to 12 (December).

<day>::<NRf> specifies the day. Range: 1 to 31. These values are rounded to the nearest integer.

*RST has no effect on the settings.

Examples

SYSTEM:DATE 2008,3,19 sets the internal calendar to March 19, 2008.

SYSTem:ERRor:ALL? (Query Only)

Queries the error/event queue for all the unread items and removes them from the queue. The response is a comma separated list of number, string pairs in FIFO order. For details of the error messages, refer to Error messages and codes (on page 2806).

Conditions

Measurement views: All

Group

System commands

Syntax

`SYSTem:ERRor:ALL?`

Arguments

None

Returns

`<ecode>,"<edesc>[;<einfo>]"{,<ecode>,"<edesc>[;<einfo>]"}`

Where

`<ecode>::<NR1>` is the error/event code (-32768 to 32767).

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the detail of the error/event.

If the queue is empty, the response is 0, "No error; Queue empty - No events to report".

Examples

`SYSTEM:ERROR:ALL?` might return `-130, "Suffix error; Unrecognized suffix, INPutMLEVel -10dB"`, indicating that the unit of the reference level is improper.

SYSTem:ERRor:CODE:ALL? (Query Only)

Queries the error/event queue for all the unread items and removes them from the queue. The response returns a comma separated list of only the error/event code numbers in FIFO order. For details of the error messages, refer to Error messages and codes (on page 2806).

Conditions

Measurement views: All

Group

System commands

Syntax

`SYSTem:ERRor:CODE:ALL?`

Arguments

None

Returns

`<ecode>{,<ecode>}`

Where

`<ecode>::<NR1>` is the error/event code, ranging from -32768 to 32767.

If the queue is empty, the response is 0.

Examples

`SYSTEM:ERROR:CODE:ALL?` might return `-101,-108` of the error codes.

SYSTem:ERRor:CODE[:NEXT]? (Query Only)

Queries the error/event queue for the next item and removes it from the queue. The response returns only the error/event code number omitting the string. Except for the shortened response, the query operates identically to SYSTem:ERRor[:NEXT]?. For details of the error messages, refer to Error messages and codes (on page 2806).

Conditions

Measurement views: All

Group

System commands

Syntax

`SYSTem:ERRor:CODE[:NEXT]?`

Arguments

None

Returns

`<ecode>::<NR1>` is the error/event code, ranging from −32768 to 32767.

Examples

`SYSTEM:ERROR:CODE:NEXT?` might return `−101` of the error code.

SYSTem:ERRor:COUNt? (Query Only)

Queries the error/event queue for the number of unread items. As errors and events may occur at any time, more items may be present in the queue at the time it is actually read.

Conditions

Measurement views: All

Group

System commands

Syntax

`SYSTem:ERRor:COUNt?`

Arguments

None

Returns

`<enum>::<NR1>` is the number of errors/events.

If the queue is empty, the response is 0.

Examples

`SYSTEM:ERROR:COUNT?` might return `2`, indicating that the error/event queue contains two of unread errors/events.

SYSTem:ERRor[:NEXT]? (Query Only)

Queries the error/event queue for the next item and removes it from the queue. The response returns the full queue item consisting of an integer and a string. For details of the error messages, refer to the Measurement status conditions table in the PDF of the Programmer manual for your product.

Conditions

Measurement views: All

Group

System commands

Syntax

`SYSTem:ERRor[:NEXT]?`

Arguments

None

Returns

`<ecode>,"<edesc>[;<einfo>]"`

Where

`<ecode>::<NR1>` is the error/event code, ranging from −32768 to 32767.

`<edesc>::<string>` is the description on the error/event.

`<einfo>::<string>` is the additional information on the error/event.

Examples

`SYSTEM:ERROR:NEXT?` might return `-130, "Suffix error; Unrecognized suffix, INPutMLEVel -10dB"`, indicating that the unit is improper.

SYSTem:GNSS:ALTitude (No Query Form)

Query the GNSS altitude.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

`SYSTem:GNSS:ALTitude <altitude>`

Returns

`<altitude>::<NRF>` in meters.

Examples

`SYSTEM:GNSS:ALTITUDE` might return `60.1`, the GNSS altitude.

SYSTem:GNSS:COURse? (Query Only)

Query the GNSS course in degrees.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:COURse?
```

Examples

`SYSTEM:GNSS:COURSE?` might return `162.78`, indicating the GNSS course is 162.78 degrees.

SYSTem:GNSS:DATA? (Query Only)

Query the GNSS data.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:DATA?
```

Returns

```
<status>, <longtitude>, <latitude>, <altitude>, <timestamp>, <speed>, <course>,
satellites> <HDOP>
```

Examples

`SYSTEM:GNSS:DATA?` might return
`LOCK,-122.8197333333,45.4994000000,63.4000000000,"2012-06-01T13:51:26.00",22.96480`

SYSTem:GNSS:HDOP? (Query Only)

Query the GNSS HDOP value.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax
`SYSTem:GNSS:HDOP?`

Returns
`<value>::<NR1>` the horizontal DOP value.

Examples
`SYSTEM:GNSS:HDOP?` might return `900.000E-3`, the GNSS HDOP value.

SYSTem:GNSS:LATitude? (Query Only)
Query the GNSS latitude.

Conditions
Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group
System commands

Syntax
`SYSTem:GNSS:LATitude?`

Examples
`SYSTEM:GNSS:LATITUDE?` might return `45.497193`, the GNSS latitude.

SYSTem:GNSS:LONGitude? (Query Only)
Query the GNSS longtitude.

Conditions
Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group
System commands

Syntax
`SYSTem:GNSS:LONGitude?`

Examples
`SYSTEM:GNSS:LONGITUDE?` might return the `-122.82372`, the GNSS longitude.

SYSTem:GNSS:SATellites? (Query Only)
Query the number of GNSS satellites.

Conditions
Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:SATellites?
```

Examples

`SYSTEM:GNSS:SATELLITES?` might return `10.000`, indicating the number of GNSS satellites is 10.

SYSTem:GNSS:SELected

Selects or queries the source for the GNSS signal.

The INTernal argument is not available with the RSA306.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:GNSS:SELected { NONE | INTernal | EXTernal }
SYSTem:GNSS:SELected?
```

Arguments

`NONE`: Selects no GNSS system.

`EXTernal`: This can be an external USB device or other external device on the table.

Returns

`NONE`: No GNSS system is selected.

`EXTernal`: The external GNSS system.

Examples

`SYSTEM:GNSS:SELECTED?` might return `EXT`, indicating the source for the GNSS system is an external device.

SYSTem:GNSS:SERial:BAUD

Sets or queries the GNSS serial baud rate.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:SERial:BAUD { 4800, 9600, 19200, 38400 }
SYSTem:GNSS:SERial:BAUD?
```

Examples

`SYSTEM:GNSS:SERIAL:BAUD 19200` sets the baud rate to 19200.

SYSTem:GNSS:SERial:PORT

Sets or queries the GNSS serial communications port.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:SERial:PORT <COM_Port>
SYSTem:GNSS:SERial:PORT?
```

Examples

`SYSTEM:GNSS:SERIAL:PORT 1` sets PORT 1 as the GNSS serial communications port.

SYSTem:GNSS:SPEed? (Query Only)

Query the GNSS speed in meter/hour.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:SPEed?
```

Examples

`SYSTEM:GNSS:SPEED?` might return `31.33583`, indicating the GNSS speed is 31.33583 meters/hour.

SYSTem:GNSS:STATus? (Query Only)

Query the GNSS status.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:STATus?
```

Returns

```
{ OFF | BAD | UNLock | LOCKed }
```

Where:

`OFF` - the GNSS is turned off.

`BAD` - a communication error.

`UNL` - the GNSS is unlocked.

`LOCK` - the GNSS is locked.

Examples

`SYSTEM:GNSS:STATUS?` might return `BAD`, indicating a communication error has occurred. For example, the GNSS port or baud rate is wrong.

SYSTem:GNSS:TIMestamp? (Query Only)

Query the GNSS timestamp.

Conditions

Measurement views: All

Requires an RSA306B/500A/600A instrument.

Group

System commands

Syntax

```
SYSTem:GNSS:TIMestamp?
```

Examples

`SYSTEM:GNSS:TIMESTAMP?` might return `2012-06-01T13:47:21.00`, the GNSS timestamp.

SYSTem:KLOCk

Enables or disables the local lockout operation.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:KLOCk { OFF | ON | 0 | 1 }
SYSTem:KLOCk?
```

Arguments

`OFF` or `0` disables the local lockout operation.

`ON` or `1` enables the local lockout operation.

Examples

`SYSTEM:KLOCK ON` enables the local lockout operation.

SYSTem:LASTaligned:DATEtime? (Query Only)

Queries the last alignment date and time of the device.

Conditions

Should be connected RSA7100B or RSA7100A to query.

Group

System commands

Syntax

`:SYSTem:LASTaligned:DATEtime?`

Examples

`:SYSTem:LASTaligned:DATEtime?` returns last alignment date and time of the device.

SYSTem:LASTaligned:TEMPerature? (Query Only)

Queries the last aligned temperature of the device.

Conditions

Should be connected to RSA7100B or RSA7100A to query.

Group

System commands

Syntax

`:SYSTem:LASTaligned:TEMPerature?`

Examples

`:SYSTem:LASTaligned:TEMPerature?` returns last aligned temperature of the device.

SYSTem:LINK:SETTings

Sets or queries whether or not global settings linking enabled for the measurements displayed.

Conditions

Measurement views: General Signal viewing and GPDemod Measurements.

Group

System commands

Syntax

`SYSTem:LINK:SETTings`

Arguments

`0` indicates global settings linking is disabled.

`1` indicates global settings linking is enabled.

Examples

`SYSTem:LINK:SETTings 1` enables the global settings linking for the displayed measurement views.

SYSTem:LINK:SETTings:SYNC

Sets the synchronize settings referring to source for the measurements displayed.

Conditions

Measurement views: General Signal viewing and GPDemod Measurements.

Group

System commands

```
Syntax
SYSTem:LINK:SETTings:SYNC { 'Source1' | 'Source2' | 'Source3' | 'Source4'}
```

Arguments

`'Source1'` or `'Source2'`.

Examples

`SYSTem:LINK:SETTings:SYNC 'Source2'` synchronizes the settings referring to Source2 for the displayed measurement views.

SYSTem:OPTions? (Query Only)

Queries the options installed in the analyzer. This command is equivalent to the IEEE common command *OPT?.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:OPTions?
```

Arguments

None

Returns

`<option>::<string>` contains the comma-separated option numbers.

Examples

`SYSTEM:OPTIONS?` might return `"01,02,20"`, indicating that Option 01, 02, and 20 are currently installed in the analyzer.

SYSTem:PRESet (No Query Form)

Restores the analyzer to the defaults. This command is equivalent to the Preset key on the front panel.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet
```

Arguments

None

Examples

`SYSTEM:PRESET` restores the analyzer to the defaults.

SYSTem:PRESet:APPLication:ACTion

Sets or queries the preset action for the application preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:APPLication:ACTion { RECall | SHOW }
SYSTem:PRESet:APPLication:ACTion?
```

Arguments

`RECall` recalls the selected preset for the application preset type.

`SHOW` lists the available presets for the application preset type.

Examples

`SYSTEM:PRESET:APPLICATION:ACTION SHOW` lists the available presets for the application preset type.

SYSTem:PRESet:BLUEtooth:STANdard

Sets or queries the standard, setup, Retaining Current Reference level, and Retaining Center Frequency in the Bluetooth standard preset.

Conditions

Measurement views: Launch BT Application

Group

System commands

Syntax

```
SYSTem:PRESet:BLUEtooth:STANdard {BR | LE | EDR}, {BW20DB | MODD | INBE | NCOM}, {1 | 0}, {1 | 0}
```

Arguments

`BR` is the Basic Rate.

`LR` is the Low Energy Rate.

`EDR` is the Enhanced Data Rate.

`<test_setup> :: = {BW20DB|MODD|INBE|NCOM}` the name of the test setup.

`<Retaining_Current_Reflevel> :: = [1 | 0]` where 1 indicates this value is checked in the view; 0 indicates the value is unchecked.

`<Retaining_Center_Frequency> :: = [1 | 0]` where `1` indicates this value is checked in the view; `0` indicates the value is unchecked.

Examples

`SYSTEM:PRESET:BLUETOOTH:STANDARD BR,MODD,0,1` will set Preset to Bluetooth, standard to basic rate, Test Setup to Modulation/Frequency Offset/Drift/Output Power, disable the retain current center frequency setting, Enable the Retain current ref level setting.

SYSTem:PRESet:DPX (No Query Form)

Restores the analyzer to the defaults for the DPX preset type.

Conditions

Measurement views: All

Group

System commands

```
Syntax
SYSTem:PRESet:DPX { SWEPt | REALtime | ZERospan }
```

Arguments

`SWEPt` restores the setup of the Swept DPX measurement.

`REALtime` restores the setup of the Realtime DPX measurement (110 MHz span).

`ZERospan` restores the setup of the Zero Span DPX measurement.

Examples

`SYSTEM:PRESET:DPX REALtime` restores the DPX, Spectrum to realtime.

SYSTem:PRESet:DPX:ACTion

Sets or queries the preset action for the DPX preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:DPX:ACTion { RECall | SHOW }
SYSTem:PRESet:DPX:ACTion?
```

Arguments

`RECall` recalls the selected preset for the DPX preset type.

`SHOW` lists the available presets for the DPX preset type.

Examples

`SYSTEM:PRESET:DPX:ACTION SHOW` lists the available presets for the DPX preset type.

SYSTem:PRESet:DPX:SELected

Sets or queries the presets for the DPX preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:DPX:SELected { OPEn | SWEPt | REALtime | ZERospan }
SYSTem:PRESet:DPX:SELected?
```

Arguments

`OPEn` sets the DPX measurement to Open the DPX display.

`SWEPt` sets the DPX measurement to Swept mode.

`REALtime` sets the DPX measurement to Real-time mode (110 MHz span).

`ZERospan` sets the DPX measurement to Zero Span mode.

Examples

`SYSTEM:PRESET:DPX:SELECTED REALtime` sets the DPX, Spectrum to realtime

SYSTem:PRESet:LTE:STANdard

Sets or queries the following: Preset, Test Setup, frame structure channel bandwidth, Base Station category (for LTE ACLR and SEM test setups), Adjacent channel type (for LTE ACLR test setup), Retain current Center Frequency setting, and Retain current Reference Level.

Conditions

Measurement view: Standards Presets

Group

System commands

Syntax

```
SYSTem:PRESet:LTE:STANdard { MODUlation | ACLR | CS | SEM, FDD | TDD, BW1PT4M | BW3M | BW5M | BW10M
    | BW15M | BW20M, WACA | WACB1 | WACB2 | HACAB | LACAB | MACAB, UTRA | EUTRA,CR1PT28M | CR3PT84M
    | CR7PT68M, 0 | 1, 0 | 1 ]
SYSTem:PRESet:LTE:STANdard?
```

Arguments

MODUlation | ACLR | CS | SEM, FDD | TDD, BW1PT4M | BW3M | BW5M | BW10M | BW15M | BW20M, WACA | WACB1 | WACB2 | HACAB | LACAB | MACAB, UTRA | EUTRA, CR1PT28M | CR3PT84M | CR7PT68M, 0 | 1, 0 | 1

Returns

See Arguments.

Examples

SYSTEM:PRESET:LTE:STANDARD? might return MOD,FDD,BW1PT4M,0,1, indicating that the test setup is Cell ID, Frame Structure, Channel BW, Retain Center Frequency, Retain Reference Level.

SYSTem:PRESet[:MAIN](No Query Form)

Restores the analyzer to the defaults. This command is equivalent to the SYSTem:PRESet command.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet[:MAIN] { MAIN|}
SYSTem:PRESet[:MAIN]?
```

Arguments

CURRent restores the analyzer to the current version of the main preset.

V1 restores the analyzer to the original version of the main preset.

V2 restores the analyzer to the Full Spectrum version of the main preset.

Examples

SYSTEM:PRESET[:MAIN] CURRENT restores the analyzer to the defaults of the current version.

SYSTem:PRESet:MAIN:ACTion

Sets or queries the preset action for the main preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:MAIN:ACTion { RECall | SHOW }
SYSTem:PRESet:MAIN:ACTion?
```

Arguments

RECall recalls the selected preset for the main preset type.

SHOW lists the available presets for the main preset type.

Examples

SYSTEM:PRESET:MAIN:ACTION SHOW lists the available presets for the main preset type.

SYSTem:PRESet:MAIN:SELected

Sets or queries the presets for the Main preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:MAIN:SELected { CURRent | V1 | V2 }
SYSTem:PRESet:MAIN:SELected?
```

Arguments

CURRent selects the current version of the Main presets.

V1 selects the previous version of the main preset.

V2 selects Full Spectrum Sweep version of the current main preset.

Examples

SYSTEM:PRESET:MAIN:SELECTED CURRent selects the current version of the Main presets.

SYSTem:PRESet:P25:STANdard (No Query Form)

This command restores the analyzer defaults for the P25 Standards preset.

Conditions

Measurement view: Any P25 measurement

Group

System commands

Syntax

```
SYSTem:PRESet:P25:STANdard <{ PHASe1 | PHASe2 }>,<{ C4FM | HCPM | HDQPSK }>,<{ 1 | 0 }>
```

Arguments

PHASe1 and PHASe2 are the P25 standard types.

C4FM, HCPM, HDQPSK are the P25 modulation types.

1 = retain center frequency; 0 = do not retain center frequency.

Returns

<standard> is the P25 standard type: Phase1, Phase2.

<modulation type> is the P25 modulation type: C4FM, HCPM (Inbound), HDQPSK (Outbound).

<{ 1 | 0 }> controls whether or not the center frequency is retained: 0 = not retained; 1 = retained.

Examples

SYSTEM:PRESET:P25:STANDARD? might return PHASE1,C4FM,0, indicating that the P25 preset is set to standard type Phase 1, modulation type C4FM, and that the center frequency is set to not be retained.

SYSTem:PRESet:STANdards (No Query Form)

Restores the analyzer to the defaults for the WLAN Standards preset type. To restore the analyzer to a preset file, use the command SYSTem:PRESet:USER (on page 2607).

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:STANdards <WLAN>
```

Arguments

<WLAN> specifies to restore the analyzer to the WLAN standards preset type.

Examples

SYSTEM:PRESET:STANDARDS "WLAN" restores the analyzer to the defaults for the WLAN Standards preset type.

SYSTem:PRESet:STANdards:ACTion

Sets or queries the preset action for the Standards preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:STANdards:ACTion { RECall | SHOW }
SYSTem:PRESet:STANdards:ACTion?
```

Arguments

RECall recalls the selected preset for the Standards preset type.

SHOW lists the available presets for the Standards preset type.

Examples

SYSTEM:PRESET:STANDARDS:ACTION SHOW lists the available presets for the Standards preset type.

SYSTem:PRESet:USER (No Query Form)

Restores the analyzer to the defaults for the user preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:USER <file_name>
```

Arguments

`<file_name>::<string>` specifies the user presets file to restore. The file extension is .Setup. You can omit the extension.

Examples

`SYSTEM:PRESET:USER "Spectrum"` restores the defaults of the file “Spectrum.Setup” from the C:\RSA5100B Files\User Presets directory.

SYSTem:PRESet:USER:ACTion

Sets or queries the preset action for the user preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:USER:ACTion { RECall | SHOW }
SYSTem:PRESet:USER:ACTion?
```

Arguments

`RECall` recalls the selected preset for the user preset type.

`SHOW` lists the available presets for the user preset type.

Examples

`SYSTEM:PRESET:USER:ACTION SHOW` lists the available presets for the User preset type.

SYSTem:PRESet:USER:SELected

Sets or queries the presets for the User preset type.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:USER:SELected <file_name>
```

SYSTem:PRESet:USER:SELected?

Arguments

<file_name>::<string> specifies the User presets file to set. The file extension is .Setup. You can omit the extension.

Examples

SYSTEM:PRESET:USER:SELECTED "Spectrum" sets the User preset to “Spectrum.Setup” saved in C:\RSA5100B Files\User Presets directory.

SYSTem:PRESet:WLAN:AD:STANdard

Sets or queries the 802.11ad preset standard.

Conditions

Measurement views: All 802.11ad measurement views

Group

System commands

Syntax

SYSTem:PRESet:WLAN:AD:STANdard {SC| CPHY,SEM| EVM,0| 1,0| 1,CH1| CH2}
SYSTem:PRESet:WLAN:AD:STANdard?

Arguments

SC|CPHY = Sets standard as either Single carrier or Control PHY

SEM|EVM = Sets Test setup as either SEM or EVM

0|1 = Checks or unchecks the check box for Retain current Center Frequency settings

0|1 = Checks or unchecks the check box for Retain Current Ref Level setting

CH1|CH2 = Selects between channel 1 and channel 2

Returns

See Arguments

Examples

SYSTEM:PRESET:WLAN:AD:STANDARD? might return "SC,EVM,0,1,CH2", indicating the standard selected is single carrier, test setup selected is EVM, Retain current Center Frequency box is disabled (unchecked), Retain Current Ref Level is enabled (checked), and Channel 2 is selected.

SYSTem:PRESet:WLAN:AY:STANdard

Set or query the WLAN 802.11ay standard, Retain Current Center Frequency setting, and Retain Current Reference Level setting in the WLAN 802.11ay standard preset.

Conditions

Measurement views: All WLAN 802.11ay

Group

System commands

Syntax

```
SYSTem:PRESet:WLAN:AY:STANdard <AYSC>,{ EVM | SEM },{ 0 | 1},{ 0 | 1 },{ CH1 | CH2 },{ BW1X |
   BW2X }
SYSTem:PRESet:WLAN:AY:STANdard?
```

Arguments

Argument	Description
AYSC	Sets the standard to Single Carrier.
EVM | SEM	Sets the test setup as EVM or SEM.
0 | 1	Retains the Center Frequency.
0 | 1	Retains the Reference Level.
CH1 | CH2	Sets the Radio Frequency Source to Channel 1 or Channel 2.
BW1X | BW2X	Sets the Channel Bandwidth as 2.16 GHz or 4.32 GHz.

Returns

See Arguments.

Examples

`SYST:PRES:WLAN:AY:STAN AYSC,EVM,0,1,CH2,BW1X` sets preset to 802.11ay, standard to Single Carrier, disables the Retain Current Center Frequency setting, enables the Retain Current Reference Level setting, and sets the channel to CH2.

`SYST:PRES:WLAN:AY:STAN?` may return `AYSC, SEM, 1, 0 , CH1, BW2X`, which means that the standard is Single Carrier, the display type is SEM, the Center Frequency is retained, the Reference Level is not retained, Reference Frequency Source is set to channel 1, and the Channel Bandwidth is 4.32 GHz.

SYSTem:PRESet:WLAN:STANdard

Sets or queries the standard and bandwidth presets for the WLAN standards preset type. The first enumeration is the 802.11 standard; the second enumeration is the bandwidth.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:PRESet:WLAN:STANdard { B | AC,[BW20|BW40|BW80|BW160] | [A,G],BW20 | P,[BW5|BW10|BW20] | J,
   [BW10|BW20] | N,[BW20|BW40] }
SYSTem:PRESet:WLAN:STANdard?
```

Arguments

`B` selects the 802.11b WLAN standard preset options.

`AC,[BW20|BW40|BW80|BW160]` selects the 802.11b WLAN standard preset options.

`[A,G],BW20` selects the 802.11a or g WLAN standard preset options.

`P,[BW5|BW10|BW20]` selects the 802.11p WLAN standard preset options.

`J,[BW10|BW20]` selects the 802.11j WLAN preset options.

`N,[BW20|BW40]` selects the 802.11n WLAN standard preset options.

Examples

`SYSTEM:PRESET:WLAN:STANDARD P, BW5` selects 802.11p as the WLAN standard to use and 5 MHz as the bandwidth preset.

SYSTem:SVPC:DISconnect (No Query Form)

Disconnects an RSA306B/500A/600A/7100A. If playback is active, exits playback.

Group

System commands

Syntax

`SYSTem:SVPC:DISconnect`

Arguments

None.

SYSTem:SVPC:CONNect (No Query Form)

Connects an RSA306B/500A/600A/7100A.

Group

System commands

Syntax

`SYSTem:SVPC:CONNect`

Arguments

None.

SYSTem:SVPC:CONNect:RSA300 (No Query Form)

Connects an RSA306 instrument.

Group

System commands

Syntax

`SYSTem:SVPC:CONNect:RSA300`

Arguments

None.

SYSTem:SVPC:HSInterface:ENABLE

Sets or queries the status of the HSI interface as enabled or disabled.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:SVPC:HSInterface:ENABLE {0|1}
SYSTem:SVPC:HSInterface:ENABLE?
```

Arguments

`0` to disable

`1` to enable

Example

`:SYSTem:SVPC:HSInterface:ENABLE 1` enables the HIS interface.

SYSTem:SVPC:HSInterface:IP:ADDRess

Sets or queries the IP address of the instrument connected via HSI interface.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:SVPC:HSInterface:IP:ADDRess <value>
SYSTem:SVPC:HSInterface:IP:ADDRess?
```

Arguments

`<value>::<NR1>` specifies the IP address of the instrument.

Examples

`:SYSTem:SVPC:HSInterface:IP:ADDRess "134.64.244.152"` sets the IP address to given value.

SYSTem:SVPC:HSInterface:PORT:NUMBer

Sets or queries the port number of the instrument connected via HSI interface.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:SVPC:HSInterface:PORT:NUMBer <value>
SYSTem:SVPC:HSInterface:PORT:NUMBer?
```

Arguments

`<value>::<NR1>` specifies the port number of the instrument.

Examples

`:SYSTem:SVPC:HSInterface:PORT:NUMBer 5000` sets the port number to given value.

SYSTem:SVPC:HSInterface:USE:LOCAlhost

Sets or queries whether the HSI interface is connected via the local host.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:SVPC:HSInterface:USE:LOCAlhost <value>
SYSTem:SVPC:HSInterface:USE:LOCAlhost?
```

Arguments

`0` to disable

`1` to enable

Examples

`:SYSTem:SVPC:HSInterface:USE:LOCAlhost 1` indicates that HIS interface is using local host.

SYSTem:SVPC:INSTrument:SERial? (Query Only)

Available when an RSA is connected to SignalVu-PC.

Queries the serial number and model of the connected instrument.

Group

System commands

Syntax

```
SYSTem:SVPC:INSTrument:SERial?
```

Arguments

None.

Returns

Serial number and model of connected instrument.

This commands will not return the correct instrument serial number if an RSA is disconnected and then another connected without using the Search for Instruments tool in the SignalVu-PC application to find and connect to the new instrument.

SYSTem:SVPC:INSTrument:VERSion? (Query Only)

Available when an RSA is connected to SignalVu-PC. Queries the firmware version of the connected instrument.

Group

System commands

Syntax

```
SYSTem:SVPC:INSTrument:VERSion?
```

Arguments

None.

Returns

Firmware version of connected instrument.

This commands will not return the correct instrument firmware version if an RSA is disconnected and then another connected without using the Search for Instruments tool in the SignalVu-PC application to find and connect to the new instrument.

SYSTem:SVPC:INSTrument:MODEL? (Query Only)

Available when an RSA is connected to SignalVu-PC. Queries the model of the connected instrument.

Group

System commands

Syntax

```
SYSTem:SVPC:INSTrument:MODEL?
```

Arguments

None.

Returns

Model of connected instrument.

This commands will not return the correct model if an RSA is disconnected and then another connected without using the Search for Instruments tool in the SignalVu-PC application to find and connect to the new instrument.

SYSTem:SVPC:INSTrument:OPTions? (Query Only)

Available when an RSA is connected to SignalVu-PC. Queries the options for the connected instrument.

Group

System commands

Syntax

```
SYSTem:SVPC:INSTrument:OPTions?
```

Arguments

None.

Returns

Model of connected instrument.

This commands will not return the correct options if an RSA is disconnected and then another connected without using the Search for Instruments tool in the SignalVu-PC application to find and connect to the new instrument.

SYSTem:SVPC:SOURce<x>:ADD

Adds Measurement Source.

Conditions

It should be connected to MSO/LPD/DPO7/SX to set.

Group

System commands

Syntax

`SYSTem:SVPC:SOURce<x>:ADD`

Related Commands

SYSTem:SVPC:SOURce<x>:REMOve (on page 2615)

SYSTem:SVPC:SOURce<x>:RENAme (on page 2616)

SYSTem:SVPC:SOURce<x>:REMOve:ALL (on page 2616)

Arguments

`<x>` specifies the measurement source index, 1 for Source1.

Returns

None

Examples

`SYSTem:SVPC:SOURce1:ADD` adds measurement source under source configuration.

SYSTem:SVPC:SOURce<x>:REMOve

Removes latest user defined measurement Source from source configuration.

Conditions

It should be connected to MSO/LPD/DPO7/SX to set.

Group

System commands

Syntax

`SYSTem:SVPC:SOURce<x>:REMOve`

Related Commands

SYSTem:SVPC:SOURce<x>:ADD (on page 2615)

SYSTem:SVPC:SOURce<x>:RENAme (on page 2616)

SYSTem:SVPC:SOURce<x>:REMOve:ALL (on page 2616)

Arguments

`<x>` specifies the measurement source index, 1 for Source1.

Returns

None

Examples

`SYSTem:SVPC:SOURce1:REMOve` removes the measurement source from source configuration.

SYSTem:SVPC:SOURce<x>:REMOve:ALL

Removes all user defined measurement sources from source configuration.

Conditions

It should be connected to MSO/LPD/DPO7/SX to set.

Group

System commands

Syntax

```
SYSTem:SVPC:SOURce?:REMOve:ALL
```

Related Commands

```
SYSTem:SVPC:SOURce<x>:ADD
SYSTem:SVPC:SOURce<x>:REMOve
SYSTem:SVPC:SOURce<x>:RENAme
```

Arguments

None

Returns

None

Examples

`SYSTem:SVPC:SOURce:REMOve:ALL`, removes all user defined measurement sources from source configuration.

SYSTem:SVPC:SOURce<x>:RENAme

Sets or queries measurement source name under source configuration.

Conditions

It should be connected to MSO/LPD/DPO7/SX to set or query.

Group

System commands

Syntax

```
SYSTem:SVPC:SOURce<x>:RENAme <source_name>
SYSTem:SVPC:SOURce<x>:RENAme?
```

Related Commands

SYSTem:SVPC:SOURce<x>:ADD (on page 2615)

SYSTem:SVPC:SOURce<x>:REMOve (on page 2615)

SYSTem:SVPC:SOURce<x>:REMOve:ALL (on page 2616)

Arguments

<x> specifies measurement source index, 1 for Source1.

<source_name> specifies custom source name.

Returns

Measurement Source name

Examples

SYSTem:SVPC:SOURce1:RENAme "Wifi" renames the measurement source "Source 1" to "Wifi".

SYSTem:SVPC:SOURce1:RENAme? returns the measurement Source "Source 1" name.

SYSTem:SVPC:VINStr:CONNect

Connects to the Virtual Instrument MSO5/6, DPO7 oscilloscopes.

Group

System commands

Syntax

SYSTem:SVPC:VINStr:CONNect <instrument>, <channels>, <RT BW>

Arguments

<virtual_instrument_type>::<instrument> specifies the type of Virtual instrument to connect with.

<number_of_channels>::<channels> specifies the number of channels of the virtual instrument.

<max_rt_bandwidth>::<RT BW> specifies the maximum real time bandwidth of the virtual instrument in GHz.

<virtual_instrument_type>	<number_of_channels>	<max_rt_bandwidth> (GHz)
MSO5/6	2, 4, 8	1, 2.5, 4, 6, 8, 10
DPO7	2, 4	8, 10, 13, 16, 20, 25

Related commands

SYSTem:SVPC:INSTrument:MODEL? (on page 2614)

To check if the connection was successful. Returns "VI MSO5/6" or "VI DPO7" based on the virtual instrument connected.

Examples

SYSTem:SVPC:VINStr:CONNect "DPO7", "4", "20" connects to Virtual instrument of type DPO7 with 4 channels and maximum real time bandwidth of 20 GHz.

SYSTem:SVPC:VINStr:CONNect "MSO5/6", "8", "10" connects to Virtual instrument of type MSO5/6 with 8 channels and maximum real time bandwidth of 10 GHz.

SYSTem:SVPC:VINStr:CHANnel2:CONFig

Sets or queries the channel configurations of the Virtual Instrument.

Group

System commands

Syntax

```
SYSTem:SVPC:VINStr:CHANnel<x>:CONFig <signalType_param1_param2>
SYSTem:SVPC:VINStr:CHANnel<x>:CONFig?
```

Arguments

`<signalType_param1_param2>::<string>` specifies the signal type, parameter1 and parameter2 for the Channel<x>. Allowed signal types are QAM, PULSE, MULTI TONE.

`<x>` = values representing range of channels available in the connected virtual instrument.

Examples

`SYSTem:SVPC:VINStr:CHANnel2:CONFig "MULTI TONE_10e6_-10"` sets the Channel2 Signal type to MULTI TONE, Signal Step to 10 MHz and Amplitude to -10 dBm.

`SYSTem:SVPC:VINStr:CHANnel2:CONFig?` returns the current configuration of Channel2 in string format. In this case "CH2_MULTI TONE_10e6_-10".

SYSTem:TEMPerature? (Query only)

Queries the current device temperature.

Conditions

Should be connected to RSA7100B or RSA7100A to query.

Group

System commands

Syntax

```
:SYSTem:TEMPerature?
```

Examples

`SYSTem:TEMPerature?` returns current device temperature of the device.

SYSTem:TIME

Sets or queries the time (hours, minutes, and seconds). This command is equivalent to the time setting through the Windows Control Panel.

Conditions

Measurement views: All

Group

System commands

Syntax

```
SYSTem:TIME <hour>,<minute>,<second>
SYSTem:TIME?
```

Related Commands

SYSTem:DATE (on page 2591)

Arguments

<hour>::<NRf> specifies the hours. Range: 0 to 23.

<minute>::<NRf> specifies the minutes. Range: 0 to 59.

<second>::<NRf> specifies the seconds. Range: 0 to 59. These values are rounded to the nearest integer.

*RST has no effect on the settings.

Examples

SYSTEM:TIME 10,15,30 sets the time to 10:15:30.

SYSTem:VERSion? (Query Only)

Returns the SCPI version number for which the analyzer complies.

Conditions

Measurement views: All

Group

System commands

Syntax

SYSTem:VERSion?

Arguments

None

Returns

<NR2> has the form YYYY.V where the Ys represent the year-version (for example, 1999) and the V represents an approved revision number for that year.

Examples

SYSTEM:VERSION? might return 1999.0 for the SCPI version.

Trace Commands

TRACe:{AM|FM|PM}:DETection

Sets or queries the display detector, the method to be used for decimating traces to fit the available horizontal space on screen. The number of horizontal pixels on screen is generally smaller than that of waveform data points. When actually displayed, the waveform data is therefore thinned out, according to the number of pixels, for being compressed.

Conditions

Measurement views: AM, FM, PM

Group

Trace commands

Syntax

TRACe:{AM|FM|PM}:DETection { AVERage | POSitive | NEGative }

```
TRACe:{AM|FM|PM}:DETection?
```

Arguments

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

Examples

`TRACE:AM:DETECTION AVERage` specifies that the trace displays the average data value for each pixel.

TRACe:{AM|FM|PM}:FREeze

Determines whether or not to freeze the trace display in the AM/FM/PM view.

Conditions

Measurement views: AM, FM, PM

Group

Trace commands

Syntax

```
TRACe:{AM|FM|PM}:FREeze { OFF | ON | 0 | 1 }
TRACe:{AM|FM|PM}:FREeze?
```

Arguments

`OFF` or 0 updates the trace display normally.

`ON` or 1 stops updating the trace display.

Examples

`TRACE:AM:FREEZE ON` freezes the trace display.

TRACe:{AM|FM|PM}:FUNCtion

Sets or queries the trace function in the AM/FM/PM view.

Conditions

Measurement views: AM, FM, PM

Group

Trace commands

Syntax

```
TRACe:{AM|FM|PM}:FUNCtion { NORMal }
TRACe:{AM|FM|PM}:FUNCtion?
```

Arguments

`NORMal` selects the normal display.

Examples

`TRACE:AM:FUNCTION NORMal` selects the normal display in the AM view.

TRACe:DIQVtime[:MEASview<y>]:ENABle:I

Enables or disables the I trace in the Demod I&Q versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Trace commands

Syntax

```
TRACe:DIQVtime[:MEASview<y>]:ENABle:I { OFF | ON | 0 | 1 }
TRACe:DIQVtime[:MEASview<y>]:ENABle:I?
```

Arguments

`OFF` or 0 hides the I trace.

`ON` or 1 shows the I trace.

Examples

`TRACe:DIQVtime:MEASview1:ENABle:I ON` shows the I trace in the Demod I&Q versus Time measurement view 1.

TRACe:DIQVtime[:MEASview<y>]:ENABle:Q

Enables or disables the Q trace in the Demod I&Q versus Time measurement.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Trace commands

Syntax

```
TRACe:DIQVtime[:MEASview<y>]:ENABle:Q { OFF | ON | 0 | 1 }
TRACe:DIQVtime[:MEASview<y>]:ENABle:Q?
```

Arguments

`OFF` or 0 hides the Q trace.

`ON` or 1 shows the Q trace.

Examples

`TRACe:DIQVtime:MEASview1:ENABle:Q ON` shows the Q trace in the Demod I&Q versus Time Measurement view 1.

TRACe:DIQVtime[:MEASview<y>]:MODE

Sets or queries whether to display the Demod I&Q versus Time trace as vectors or symbols (points).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement view: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Trace commands

Syntax

```
TRACe:DIQVtime[:MEASview<y>]:MODE { VECTors | SYMBols }
```

Arguments

`VECTors` displays the trace in a format that uses lines to connecting points in the trace display.

`SYMBols` displays the trace in a format that does not use lines to connect points in the trace display.

Examples

`TRACe:DIQVtime:MEASview1:MODE SYMBols` sets the display to show symbols without lines connecting points Measurement view 1.

TRACe:DIQVtime[:MEASview<y>]:SELect:I

Selects the I trace in the Demod I&Q versus Time. The query version of this command returns whether the I trace is selected or not.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Trace commands

Syntax

```
TRACe:DIQVtime[:MEASview<y>]:SELect:I
TRACe:DIQVtime[:MEASview<y>]:SELect:I?
```

Arguments

None

Returns

0 indicates that the I trace is deselected.

1 indicates that the I trace is selected.

Examples

`TRACe:DIQVtime:MEASview1:SELect:I` selects the I trace in the Demod I&Q versus Time Measurement view 1.

TRACe:DIQVtime[:MEASview<y>]:SELect:Q

Selects the Q trace in the Demod I&Q versus Time. The query version of this command returns whether the Q trace is selected or not.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Demod I&Q versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod I&Q versus Time).

Group

Trace commands

Syntax

```
TRACe:DIQVtime[:MEASview<y>]:SELect:Q
TRACe:DIQVtime[:MEASview<y>]:SELect:Q?
```

Arguments

None

Returns

0 indicates that the Q trace is deselected.

1 indicates that the Q trace is selected.

Examples

`TRACe:DIQVtime[:MEASview1]:SELect:Q` selects the Q trace in the Demod I&Q versus Time Measurement view 1.

TRACe:EDIagram[:MEASview<y>]:ENABle:I

Determines whether to show or hide the I trace in the Eye diagram.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Trace commands

Syntax

```
TRACe:EDIagram[:MEASview<y>]:ENABle:I { OFF | ON | 0 | 1 }
TRACe:EDIagram[:MEASview<y>]:ENABle:I?
```

Arguments

`OFF` or `0` hides the I trace.

`ON` or `1` shows the I trace.

Examples

`TRACe:EDIagram:MEASview2:ENABle:I ON` shows the I trace in the eye diagram Measview 2.

TRACe:EDIagram[:MEASview<y>]:ENABle:Q

Determines whether to show or hide the Q trace in the Eye diagram.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Trace commands

Syntax

```
TRACe:EDIagram[:MEASview<y>]:ENABle:Q { OFF | ON | 0 | 1 }
TRACe:EDIagram[:MEASview<y>]:ENABle:Q?
```

Arguments

`OFF` or `0` hides the Q trace.

`ON` or `1` shows the Q trace.

Examples

`TRACe:EDIagram:MEASview2:ENABle:Q ON` shows the Q trace in the eye diagram Measview 2.

TRACe:EDIagram[:MEASview<y>]:SELect:I

Selects the I trace in the Eye diagram. When used as query, it returns whether the I trace is selected or not.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Trace commands

Syntax

```
TRACe:EDIagram[:MEASview<y>]:SELect:I
TRACe:EDIagram[:MEASview<y>]:SELect:I?
```

Arguments

None

Returns

`0` indicates that the I trace is deselected.

`1` indicates that the I trace is selected.

Examples

`TRACe:EDIagram:MEASview2:SELect:I` selects the I trace in the eye diagram for measview2.

TRACe:EDIagram[:MEASview<y>]:SELect:Q

Selects the Q trace in the eye diagram. The query version of this command returns whether the Q trace is selected or not.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Eye diagram

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: Eye diagram).

Group

Trace commands

Syntax

```
TRACe:EDIagram[:MEASview<y>]:SELect:Q
TRACe:EDIagram[:MEASview<y>]:SELect:Q?
```

Arguments

None

Returns

0 indicates that the Q trace is deselected.

1 indicates that the Q trace is selected.

Examples

`TRACe:EDIagram:MEASview2:SELect:Q` selects the Q trace in the eye diagram Measview 2.

TRACe:EMC:AMBient:COUNt

Sets or queries the count value of specified ambient trace in EMC view.

`<value> = <NR1>` count value

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:AMBIent:COUNt <value>
TRACe:EMC:AMBIent:COUNt?
```

Arguments

`<value> = <NR1>`

Returns

`<NR1>`

Examples

`TRACE:EMC:AMBIENT:COUNT` might return `20`, indicating that the count value of ambient trace 2 is 20.

TRACe:EMC:AMBIent:COUNt:ENABle

Sets or queries to enable or disable the count check box for specified ambient trace in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:AMBIent:COUNt:ENABle {0 | OFF | 1 | ON}
TRACe:EMC:AMBIent:COUNt:ENABle?
```

Arguments

`0` or `OFF` disables the count check box 1 or ON enables the count check box

Returns

`<Boolean>` 0, 1

Examples

`TRACE:EMC:AMBIENT:COUNT:ENABLE` might return `1`, indicating that count check box is enabled.

TRACe:EMC:AMBIent:COUNt:RESet (No Query Form)

Resets the count value of live ambient trace in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

TRACe:EMC:AMBIent:COUNt:RESet

Arguments

None

Returns

None

Examples

TRACE:EMC:AMBIENT:COUNT:RESET resets the count value of live ambient trace

TRACe:EMC:AMBIent:ENABle

Sets or queries to show or hide the ambient trace on plot by enabling or disabling the show check box in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:AMBIent:ENABle {0 | OFF | 1 | ON}
TRACe:EMC:AMBIent:ENABle?
```

Arguments

0 or OFF disables the show check box and hides the ambient trace 1 or ON enables the show check box and displays the ambient trace

Returns

<Boolean> 0, 1

Examples

TRACE:EMC:AMBIENT:ENABLE? might return 0, indicating that the selected ambient trace is hidden.

TRACe:EMC:AMBIent:FREeze

Sets or queries to freeze the ambient trace on plot by enabling or disabling the freeze check box in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:AMBIent:FREeze {0 | OFF | 1 | ON}
TRACe:EMC:AMBIent:FREeze?
```

Arguments

0 or OFF disables the freeze check box 1 or ON enables the freeze check box

Returns

<Boolean> 0, 1

Examples

TRACE:EMC:AMBIENT:FREEZE? might return 1, indicating that the selected ambient trace is frozen.

TRACe:EMC:AMBIent:FUNCtion

Sets or queries the scan function for the selected ambient trace in EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:AMBIent:FUNCtion {NONE | MAXH | AVER | AVGL}
TRACe:EMC:AMBIent:FUNCtion?
```

Arguments

NONE = Normal is the function selected

MAXH = Max Hold is the function selected

AVER = Avg(VRMS) is the function selected

AVGL = Avg (of logs) is the function selected

Returns

<String> See Arguments

Examples

TRACE:EMC:AMBIENT:FUNCTION might return AVER, indicating the scan function selected for ambient trace is Avg(VRMS).

TRACe:EMC:AMBIent:SELect

Sets or queries the selection of ambient trace in live trace of EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:AMBIent:SELect
TRACe:EMC:AMBIent:SELect?
```

Arguments

None

Returns

<Boolean> 0, 1

Examples

TRACE:EMC:AMBIENT:SELECT might return 1, indicating that ambient trace 1 is selected in live trace.

TRACe:EMC:MATH:ENABle

Sets or queries to show or hide the math trace on plot by enabling or disabling the show check box in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:MATH:ENABle {0 | OFF | 1 | ON}
TRACe:EMC:MATH:ENABle?
```

Arguments

0 or OFF disables the show check box and hides the math trace 1 or ON enables the show check box and displays the math trace

Returns

<Boolean> 0, 1

Examples

TRACE:EMC:MATH:ENABLE? might return 1, indicating that the math trace is enabled (displayed).

TRACe:EMC:MATH:FREeze

Sets or queries to freeze the math trace on plot by enabling or disabling the freeze check box in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:MATH:FREeze {0 | OFF | 1 | ON}
TRACe:EMC:MATH:FREeze?
```

Arguments

0 or OFF disables the freeze check box 1 or ON enables the freeze check box

Returns

<Boolean> 0, 1

Examples

TRACE:EMC:MATH:FREEZE? might return 1, indicating that selected math trace is frozen.

TRACe:EMC:MATH:LEFToperand

Sets or queries the trace for left operand to obtain a math trace in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:MATH:LEFToperand <arg>
TRACe:EMC:MATH:LEFToperand?
```

Arguments

<arg> = {scan1 | scan2 | ambient | recall1 | recall2 | recall3 | recall4 | recall5}

Returns

<String>

Examples

TRACE:EMC:MATH:LEFTOPERAND selects ambient trace as left operand.

TRACe:EMC:MATH:RIGHtoperand

Sets or queries the trace for right operand to obtain a math trace in EMC view.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:MATH:RIGHtoperand <arg>
TRACe:EMC:MATH:RIGHtoperand?
```

Arguments

<arg> = {scan1 | scan2 | ambient | recall1 | recall2 | recall3 | recall4 | recall5}

Returns

<String>

Examples

TRACE:EMC:MATH:RIGHTOPERAND? might return scan1, indicating that the right operand selected is scan1 trace.

TRACe:EMC:MATH:SELect

Sets or queries the selection of math trace in live trace of EMC View.

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe:EMC:MATH:SELect
TRACe:EMC:MATH:SELect?
```

Arguments

None

Returns

<Boolean> 0, 1

Examples

TRACE:EMC:MATH:SELECT might return 1, indicating that math trace is selected.

TRACe:EVM[:MEASview<y>]:MODE

Sets or queries whether to display the EVM versus Time trace as vectors or symbols (points).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement view: EVM versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: EVM versus Time).

Group

Trace commands

Syntax

```
TRACe:EVM[:MEASview<y>]:MODE { VECTors | SYMBols }
TRACe:EVM[:MEASVIEW<y>]:MODE?
```

Arguments

VECTors displays the trace in a format that uses lines to connecting points in the trace display.

SYMBols displays the trace in a format that does not use lines to connect points in the trace display.

Examples

TRACe:EVM:MEASVIEW2:MODE VECTors sets the display to connect points in the display for measview 2 of EVM versus Time.

TRACe:FDVTime[:MEASview<y>]:MODE

Sets or queries whether to display the Frequency Deviation versus Time trace as vectors or symbols (points).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement view: Frequency deviation versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Frequency deviation versus Time).

Group

Trace commands

Syntax

```
TRACe:FDVTime[:MEASview<y>]::MODE { VECTors | SYMBols }
TRACe:FDVTime[:MEASView<y>]:MODE?
```

Arguments

`VECTors` display the trace in a format that uses lines to connect points in the trace display.

`SYMBols` display the trace in a format that does not use lines to connect points in the trace display.

Examples

`TRACE:FDVTime:MEASview2:MODE VECTORS` sets the display to connect points in the display for measview 2 of Frequency deviation versus Time.

TRACe:{FSETtling|PSETtling}:AVERage:COUNt

Sets or queries the number of traces to combine. This command is effective when you select AVERage with the **s** command.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe:{FSETtling|PSETtling}:AVERage:COUNt <number>
TRACe:{FSETtling|PSETtling}:AVERage:COUNt?
```

Related Commands

TRACe:{FSETtling|PSETtling}:AVERage:ENABle (on page 2633)

Arguments

`<number>::<NR1>` specifies the number of traces to combine for averaging.

Range: 1 to 10000.

Examples

`TRACE1:PSETTLING:AVERAGE:COUNT 64` sets the average count to 64 for Trace 1.

TRACe:{FSETtling|PSETtling}:AVERage:COUNt:CURRent? (Query Only)

Queries the current running average count value. The returned value is valid (non-zero) only while the instrument is acquiring and averaging a signal. Use the `TRACe:{FSETtling|PSETtling}:AVERage:COUNt` command to determine the setting for Average.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe:{FSETtling|PSETtling}:AVERage:COUNt:CURRent?
```

Related Commands

TRACe:{FSETtling|PSETtling}:AVERage:COUNt (on page 2632)

Examples

`TRACE1:PSETTLING:AVERAGE:COUNT?` might return the value 64.

TRACe:{FSETtling|PSETtling}:AVERage:ENABle

Determines whether to enable or disable averaging the trace(s).

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe:{FSETtling|PSETtling}:AVERage:ENABle { OFF | ON | 0 | 1 }
TRACe:{FSETtling|PSETtling}:AVERage:ENABle?
```

Arguments

`OFF` or 0 disables averaging.

`ON` or 1 enables averaging.

Examples

`TRACE:PSETTLING:AVERAGE:ENABLE ON` enables the Phase Settling Time averaging.

TRACe:{FSETtling|PSETtling}:RESet (No Query Form)

If trace averaging is enabled, this command resets the current averaged trace to 0.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe:{FSETtling|PSETtling}:RESet
```

Examples

`TRACE1:PSETTLING:RESET` resets the current averaged trace to 0.

TRACe:{FSETtling|PSETtling}:SMOothing:COUNt

Sets or queries the number of data points to take the moving average for smoothing the traces. This command applies to both Trace 1 and Trace 2.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe:{FSETtling|PSETtling}:SMOothing:COUNt <number>
TRACe:{FSETtling|PSETtling}:SMOothing:COUNt?
```

Arguments

`<number>::<NR1>` specifies the number of data points to take the moving average for smoothing. Range: 2 to 1000.

Examples

`TRACE:FSETTLING:SMOOTHING:COUNT 16` sets the Frequency Settling Time smoothing count to 16.

TRACe:{FSETtling|PSETtling}:SMOothing:ENABle

Determines whether to enable or disable smoothing the trace(s).

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe:{FSETtling|PSETtling}:SMOothing:ENABle { OFF | ON | 0 | 1 }
TRACe:{FSETtling|PSETtling}:SMOothing:ENABle?
```

Arguments

`OFF` or 0 disables smoothing.

`ON` or 1 enables smoothing.

Examples

`TRACE:PSETTLING:SMOOTHING:ENABLE ON` enables the Phase Settling Time smoothing.

TRACe<x>:FVTime[:MEASview<y>]

Determines whether or not to show the trace in the Frequency versus Time view.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>] { OFF | ON | 0 | 1 }
TRACe<x>:FVTime[:MEASview<y>]?
```

Arguments

<x> = 1 to 7; Trace 2, Trace 3 and Trace 4 (math trace) are invalid.

- Trace5: Bitmap Trace
- Trace6: Ogram
- Trace7: Ogram Line

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value of y is 1.

OFF or 0 hides the trace in the Frequency versus Time view.

ON or 1 shows the trace in the Frequency versus Time view.

Examples

TRACE1:FVTIME:MEASview1 ON shows the trace in the Frequency versus Time view.

TRACe<x>:FVTime[:MEASview<y>]:AVERage:COUNt

Sets or queries the number of traces to combine. This command is effective when you select AVERage with the TRACe:FVTime[:MEASview<y>]:FUNCtion command.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:AVERage:COUNt <number>
TRACe<x>:FVTime[:MEASview<y>]:AVERage:COUNt?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<number>::<NR1> specifies the number of traces to combine for averaging.

Range: 1 to 10000.

Examples

`TRACE1:FVTIME:MEASview1:AVERAGE:COUNT 64` sets the average count to 64.

TRACe<x>:FVTime[:MEASview<y>]:COLor:CURVe

Sets or queries how colors are mapped to the signal density in the Frequency versus Time bitmap display. The mapping can be linear (Curve = 1), or it can be set to concentrate the resolution on the lower level of the range (Curve > 1) or the mapping can be set to show the best resolution on the upper range of density or hit count (Curve = 0.1 - 0.99). This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace5 is valid.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:COLor:CURVe <value>`

`TRACe<x>:FVTime[:MEASview<y>]:COLor:CURVe?`

Arguments

`<value>` = <NRf> specifies how colors are mapped to the signal density. Range: 0.1 to 10 (the default value is 2).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. The default value of y is 1.

Examples

`TRACe5:FVTIME:COLor:CURVe 1.5` concentrates the resolution on the lower level of the range on the Bitmap display.

TRACe<x>:FVTime[:MEASview<y>]:COLor:SCALe:AUTO (No Query Form)

Automatically adjusts the Max and Min color settings to display the broadest range of colors in the Frequency versus Time bitmap display. This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace5 is valid.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:COLor:SCALe:AUTO`

Arguments

`<x>` = 5 specifies the auto-color setting for the Bitmap trace.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. The default value of y is 1.

Examples

`TRACe5:FVTIME:COLor:SCALe:AUTO` autosets the Bitmap display color scheme.

TRACe<x>:FVTime[:MEASview<y>]:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for the Max or Min Hold trace in the Frequency versus Time measurement. This command is effective when `TRACe<x>:FVTime[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold` and `INITiate:CONTinuous` is set to OFF.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:COUNt <number>
TRACe<x>:FVTime[:MEASview<y>]:COUNt?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<number>::<NR1>` specifies the count for Max/Min Hold.

Range: 1 to 10000.

Examples

`TRACe1:FVTime:MEASview1:COUNt 32` sets the count to 32 for the Max/Min Hold trace.

TRACe<x>:FVTime[:MEASview<y>]:COUNt:ENABle

Determines whether to enable or disable the count for the Max or Min Hold trace in the Frequency versus Time view. This command is effective when `TRACe<x>:FVTime[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold`.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:FVTime[:MEASview<y>]:COUNt:ENABle?
```

Arguments

`<x>` = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 disables the count for the Max/Min Hold trace.

ON or 1 enables the count for the Max/Min Hold trace.

Examples

TRACe1:FVTime:MEASview1:COUNt:ENABle ON enables the Max/Min Hold count.

TRACe<x>:FVTime[:MEASview<y>]:COUNt:RESet (No Query Form)

Clears the Max or Min Hold data and counter, and restarts the process in the Frequency versus Time view. This command is effective when TRACe<x>:FVTime[:MEASview<y>]:FUNCtion is set to MAXHold or MINHold.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:COUNt:RESet
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

TRACe1:FVTime:MEASview1:COUNt:RESet clears the Max/Min Hold data and counter, and restarts the process.

TRACe<x>:FVTime[:MEASview<y>]:DETection

Enables or queries the type of detection for the specified trace. The parameter <x> represents traces 1 to 4.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:DETection {AVERage |POSitive | NEGative | POSNegative | SAMPle}
TRACe<x>:FVTime[:MEASview<y>]:DETection?
```

Arguments

<x> = 1 to 6.

- Trace 4: Math Trace (not applicable)
- Trace 5: Bitmap Trace (not applicable)
- Trace 6: Ogram

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

`POSNegative` displays the maximum and minimum data values for each pixel.

`SAMPle` displays the first sample value received for each pixel.

Examples

`TRACe2:FVTime:MEASview1:DETection POSitive` enables positive detection on Trace2.

TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent

Determines whether to enable or disable the dot persistence for the bitmap trace (Trace 5) in the Frequency versus Time view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent { OFF | ON | 0 | 1 }`

`TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent?`

Arguments

`OFF` or `0` disables the dot persistence.

`ON` or `1` enables the dot persistence.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:FVTIME:DOT:PERSISTENT ON` enables the dot persistence in the Frequency versus Time view.

TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:TYPE

Sets or queries the persistence type for the bitmap trace (Trace 5) in the Frequency versus Time view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:TYPE { VARiable | INFinite }`

`TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:TYPE?`

Arguments

`VARiable`: Selects the variable persistence display which leaves acquired data points on the display for a period of time specified by the `TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:VARiable` command.

`INFinite`: Selects the infinite persistence display which accumulates data points on the display indefinitely.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:FVTIME:DOT:PERSISTENT:TYPE VARiable` selects the variable persistence display.

TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:VARiable

Sets or queries how long data points are displayed. This command is effective when `TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:TYPE` is set to `VARiable`. This affects the display only.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:VARiable <number>`

`TRACe<x>:FVTime[:MEASview<y>]:DOT:PERSistent:VARiable?`

Arguments

`<number>` = <NRf> specifies the how long waveform points are displayed on the screen. Range: 0 s to 1000 s (the default value is 10 ms).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:FVTIME:DOT:PERSISTENT:VARIABLE 20` specifies that the waveform points are displayed on the screen for a period of 20 before they disappear.

TRACe<x>:FVTime[:MEASview<y>]:FREeze

Determines whether or not to freeze the display of the trace in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:FVTime[:MEASview<y>]:FREeze?
```

Arguments

<x> = 1 to 7.

- Trace 4: Math trace
- Trace 5: Bitmap trace
- Trace 6: Ogram
- Trace 7: Ogram Line

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 updates the display of the trace normally.

ON or 1 stops updating the display of the trace.

Examples

TRACE1:FVTIME:MEASview1:FREEZE ON stops updating the display of the trace.

TRACe<x>:FVTime[:MEASview<y>]:FUNCtion

Sets or queries the trace function in the Frequency versus Time measurement.

Conditions

Measurement views: Frequency versus Time

Group

Trace commands

Syntax

```
TRACe<x>:FVTime[:MEASview<y>]:FUNCtion { NORMal | AVERage | MAXHold | MINHold}
TRACe<x>:FVTime[:MEASview<y>]:FUNCtion?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

NORMal selects the normal waveform display.

AVERage selects the Average display that indicates the average frequency drift at each time point.

MAXHold selects the Max Hold display that indicates the maximum frequency drift at each time point.

MINHold selects the Min Hold display that indicates the minimum frequency drift at each time point.

Examples

TRACE1:FVTIME:MEASview1:FUNCTIONMAX Hold displays the Max Hold trace in the Frequency versus Time measurement.

TRACe<x>:FVTime[:MEASview<y>]:SELect

Sets or queries the selected trace.

Conditions

Applicable measurement view must be active.

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:SELect {ON | OFF | 0 | 1}`

`TRACe<x>:FVTime[:MEASview<y>]:SELect?`

Arguments

`ON` or `1` selects the specified trace

The parameter <x> = 1 to 7.

- Trace5: Bitmap Trace
- Trace6: Ogram
- Trace7: Ogram Line

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

`0` indicates the specified trace is not the selected trace.

1 indicates the specified trace is the selected trace.

Examples

`TRACe6:FVTime:MEASview1:SELect 1` selects Trace6 as the selected trace for measview 1 of Frequency vs time.

TRACe<x>:FVTime[:MEASview<y>]:SELect:LINe

Sets or queries the line number to send to the Frequency vs time ogram display.

Conditions

Applicable measurement view must be active.

Group

Trace commands

Syntax

`TRACe<x>:FVTime[:MEASview<y>]:SELect:LINe <number>`

`TRACe<x>:FVTime[:MEASview<y>]:SELect:LINe?`

Related Commands

TRACe<x>:FVTime[:MEASview<y>] (on page 2635)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

<x> = 6 for ogram trace.

`<number>::=<NR1>` specifies the line number to send to the display.

Range: 0 to the maximum line number of the ogram displayed on screen.

Returns

`<NRf>` specifies the line number to send to the spectrum display.

Examples

`TRACe6:FVTime:MEASview1:SELect:LINe 75` selects Line #75 in the ogram to send to the time plot display.

TRACe<x>:IQVTime[:MEASview<y>]:AVERage:COUNt

Sets or queries the number of traces to combine. This command works for both I and Q traces when you select AVERage in the `TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion` command.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:AVERage:COUNt <number>
TRACe<x>:IQVTime[:MEASview<y>]:AVERage:COUNt?
```

Arguments

`<x>` = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<number>::<NR1>` specifies the number of traces to combine for averaging.

Range: 1 to 10000.

Examples

`TRACE1:IQVTIME:MEASview1:AVERAGE:COUNT 64` sets the average count to 64.

TRACe<x>:IQVTime[:MEASview<y>]:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for the Max or Min Hold trace in the RF I & Q versus Time measurement. This command is effective when `TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold` and `INITiate:CONTinuous` is set to OFF.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:COUNt <number>
TRACe<x>:IQVTime[:MEASview<y>]:COUNt?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<number>::<NR1> specifies the count for Max/Min Hold.

Range: 1 to 10000.

Examples

TRACE1:IQVTIME:MEASview1:COUNT 32 sets the count to 32 for the Max/Min Hold trace.

TRACe<x>:IQVTime[:MEASview<y>]:COUNt:ENABle

Determines whether to enable or disable the count for the Max or Min Hold trace in the RF I & Q versus Time view. This command is effective when TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion is set to MAXHold or MINHold.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:IQVTime[:MEASview<y>]:COUNt:ENABle?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 disables the count for the Max/Min Hold trace.

ON or 1 enables the count for the Max/Min Hold trace.

Examples

TRACE1:IQVTIME:MEASview1:COUNT:ENABLE ON enables the Max/Min Hold count.

TRACe<x>:IQVTime[:MEASview<y>]:COUNt:RESet (No Query Form)

Clears the Max or Min Hold data and counter, and restarts the process in the RF I & Q versus Time view. This command is effective when TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion is set to MAXHold or MINHold.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:COUNt:RESet
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

`TRACE1:IQVTIME:MEASview1:COUNT:RESET` clears the Max/Min Hold data and counter, and restarts the process.

TRACe<x>:IQVTime[:MEASview<y>]:DETection

Sets or queries the detection method for the RF I & Q versus Time view.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:DETection { AVERage | POSitive | NEGative | POSNegative | SAMPle }
TRACe<x>:IQVTime[:MEASview<y>]:DETection?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

`POSNegative` displays the maximum and minimum data values for each pixel.

`SAMPle` displays the first sample value received for each pixel.

Examples

`TRACE1:IQVTIME:MEASview1:DETECTION AVERAGE` enables display of the average value for each pixel.

TRACe<x>:IQVTime[:MEASview<y>]:ENABle:I

Determines whether to show or hide the I trace in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:ENABle:I { OFF | ON | 0 | 1 }
TRACe<x>:IQVTime[:MEASview<y>]:ENABle:I?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 hides the I trace.

ON or 1 shows the I trace.

Examples

TRACE1:IQVTIME:MEASview1:ENABLE:I ON shows the I trace in the RF I & Q versus Time measurement.

TRACe<x>:IQVTime[:MEASview<y>]:ENABle:Q

Determines whether to show or hide the Q trace in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:ENABle:Q { OFF | ON | 0 | 1 }
TRACe<x>:IQVTime[:MEASview<y>]:ENABle:Q?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 hides the Q trace.

ON or 1 shows the Q trace.

Examples

TRACE1:IQVTIME:MEASview1:ENABLE:Q ON shows the Q trace in the IQ level versus Time measurement.

TRACe<x>:IQVTime[:MEASview<y>]:FREeze

Determines whether to freeze the IQ traces in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:IQVTime[:MEASview<y>]:FREeze?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 updates IQ trace display normally.

ON or 1 stops updating IQ trace display.

Examples

TRACE1:IQVTIME:MEASview1:FREEZE ON freezes the IQ traces.

TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion

Sets or queries the trace function in the RF I & Q versus Time measurement.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion { NORMal | AVERage | MAXHold | MINHold }
TRACe<x>:IQVTime[:MEASview<y>]:FUNCtion?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

NORMal selects the normal waveform display.

AVERage selects the Average display that indicates the average signal level at each time point.

MAXHold selects the Max Hold display that indicates the maximum signal level at each time point.

MINHold selects the Min Hold display that indicates the minimum signal level at each time point.

Examples

TRACE1:IQVTIME:MEASview1:FUNCTION MAXHold displays the Max Hold trace in the IQ level versus Time measurement.

TRACe<x>:IQVTime[:MEASview<y>]:SELect:I

Determines whether or not to select the I trace to obtain the maximum and minimum measurement results.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:SELect:I { OFF | ON | 0 | 1 }
TRACe<x>:IQVTime[:MEASview<y>]:SELect:I?
```

Related Commands

TRACe<x>:IQVTime[:MEASview<y>]:SELect:Q (on page 2648)

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 deselects the I trace.

ON or 1 selects the I trace.

Executing TRACe<x>:IQVTime[:MEASview<y>]:SELect:I ON sets TRACe<x>:IQVTime[:MEASview<y>]:SELect:Q OFF.

Examples

TRACE1:IQVTIME:MEASview1:SELECT:I ON selects the I trace in the RF I & Q versus Time measurement.

TRACe<x>:IQVTime[:MEASview<y>]:SELect:Q

Determines whether or not to select the Q trace to obtain the maximum and minimum measurement results.

Conditions

Measurement views: RF I & Q versus Time

Group

Trace commands

Syntax

```
TRACe<x>:IQVTime[:MEASview<y>]:SELect:Q { OFF | ON | 0 | 1 }
TRACe<x>:IQVTime[:MEASview<y>]:SELect:Q?
```

Related Commands

TRACe<x>:IQVTime[:MEASview<y>]:SELect:I (on page 2647)

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

OFF or 0 deselects the Q trace.

ON or 1 selects the Q trace.

Executing `TRACe<X>:IQVTime[:MEASview<y>]:SELect:Q ON` sets `TRACe<x>:IQVTime[:MEASview<y>]:SELect:I OFF`.

Examples

`TRACE1:IQVTIME:MEASview1:SELECT:Q ON` selects the Q trace in the RF I&Q versus Time measurement.

TRACe:MERRor[:MEASview<y>]:MODE

Sets or queries whether to display the Magnitude error trace as vectors or symbols (points).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement view: Magnitude error

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Magnitude error versus Time).

Group

Trace commands

Syntax

```
TRACe:MERRor[:MEASview<y>]:MODE { VECTors | SYMBols }
TRACe:MERRor[:MEASview<y>]:MODE?
```

Arguments

`VECTors` displays the trace in a format that uses lines to connecting points in the trace display.

`SYMBols` displays the trace in a format that does not use lines to connect points in the trace display.

Examples

`TRACE:MERRor:MEASview2:MODE VECTORS` sets the display to connect points in the display for measview 2 of MERRor versus Time.

TRACe:OBW:MAXHold

Determines whether or not to perform a Max Hold on the spectrum data for the Occupied Bandwidth trace.

Conditions

Measurement views: Occupied Bandwidth

Group

Trace commands

Syntax

```
TRACe:OBW:MAXHold { OFF | ON | 0 | 1 }
TRACe:OBW:MAXHold?
```

Arguments

`OFF` or 0 does not perform a Max Hold on the spectrum data.

`ON` or 1 performs a Max Hold on the spectrum data.

Examples

`TRACE:OBW:MAXHOLD ON` performs a Max Hold on the spectrum data for the Occupied Bandwidth trace.

TRACe:OFDM:CONSte

Determines whether or not to show the trace in the OFDM Constellation view.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe:OFDM:CONSte { OFF | ON | 0 | 1 }
TRACe:OFDM:CONSte?
```

Arguments

`OFF` or 0 hides the trace in the view.

`ON` or 1 shows the trace in the view.

Examples

`TRACE:OFDM:CONSTE ON` shows the trace in the OFDM Constellation view

TRACe:OFDM:CONSte:FREeze

Determines whether or not to freeze the display of the trace in the OFDM Constellation view.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe:OFDM:CONSte:FREeze { OFF | ON | 0 | 1 }
TRACe:OFDM:CONSte:FREeze?
```

Arguments

`OFF` or 0 updates the display of the trace normally.

`ON` or 1 stops updating the display of the trace.

Examples

`TRACE:OFDM:CONSTE:FREEZE ON` freezes the trace in the OFDM Constellation view.

TRACe:OFDM:FLATness:FREeze

Sets or queries whether to freeze the average trace on the OFDM Spectral Flatness display. When the freeze state is turned on, the trace stops updating.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Trace commands

Syntax

```
TRACe:OFDM:FLATness:FREeze {0|1|OFF|ON}
TRACe:OFDM:FLATness:FREeze?
```

Arguments

`ON` or 1 turns on the freeze state, causing the trace to stop updating.

`OFF` or 0 turns off the freeze state.

Returns

Outputs the frozen status of the selected trace as an integral value. 1 indicates a frozen trace and 0 a non-frozen trace.

Examples

`TRAC:OFDM:FLAT:FRE 1` freezes the trace, causing it to stop updating.

TRACe:OFDM:FLATness:SHOW

Displays or hides the trace on the OFDM Spectral Flatness display.

Conditions

Measurement view: OFDM

This command requires Option 22, “OFDM Measurements”.

Group

Trace commands

Syntax

```
TRACe:OFDM:FLATness:SHOW {0|1|OFF|ON}
```

Arguments

`ON` or 1 displays the trace.

`OFF` or 0 hides the trace.

Examples

`TRACE:OFDM:FLAT:SHOW 1` turns on the display of the trace.

TRACe:PERRor[:MEASview<y>]:MODE

Sets or queries whether to display the Frequency deviation versus Time trace as vectors or symbols (points).

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement view: Phase error versus Time

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Phase error versus Time).

Group

Trace commands

Syntax

```
TRACe:PERRor[:MEASview<y>]:MODE { VECTors | SYMBols }
TRACe:PERRor[:MEASview<y>]:MODE?
```

Arguments

`VECTors` displays the trace in a format that uses lines to connecting points in the trace display.

`SYMBols` displays the trace in a format that does not use lines to connect points in the trace display.

Examples

`TRACe:PERRor:MEASview2:MODE VECTors` sets the display to connect points in the display display for measview 2 of Phase error versus Time .

TRACe<x>:PHVTime[:MEASview<y>]

Determines whether or not to show the trace in the Phase versus Time view.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>] { OFF | ON | 0 | 1 }
TRACe<x>:PHVTime[:MEASview<y>]?
```

Arguments

`OFF` or `0` hides the trace in the Phase versus Time view.

`ON` or `1` shows the trace in the Phase versus Time view.

`<x>` = 1 to 7; Trace 2, Trace 3 and Trace 4 (math trace) are invalid.

- Trace5: Bitmap Trace
- Trace6: Ogram
- Trace7: Ogram Line

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

`TRACE1:PHVTIME:MEASview1 ON` shows the trace in the Phase versus Time view.

TRACe<x>:PHVTime[:MEASview<y>]:AVERage:COUNt

Sets or queries the number of traces to combine. This command is effective when you select `AVERage` with the `TRACe<x>:PHVTime[:MEASview<y>]:FUNCtion` command.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:AVERage:COUNt <number>
TRACe<x>:PHVTime[:MEASview<y>]:AVERage:COUNt?
```

Arguments

`<x>` = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`<number>::<NR1>` specifies the number of traces to combine for averaging.

Range: 1 to 10000.

Examples

`TRACE1:PHVTIME:MEASview1:AVERAGE:COUNT 64` sets the average count to 64.

TRACe<x>:PHVTime[:MEASview<y>]:COLor:CURVe

Sets or queries how colors are mapped to the signal density in the Phase versus Time bitmap display. The mapping can be linear (Curve = 1), or it can be set to concentrate the resolution on the lower level of the range (Curve > 1) or the mapping can be set to show the best resolution on the upper range of density or hit count (Curve = 0.1 - 0.99). This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace 5 is valid.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

`TRACe<x>:PHVTime[:MEASview<y>]:COLor:CURVe <value>`

`TRACe<x>:PHVTime[:MEASview<y>]:COLor:CURVe?`

Arguments

`<value>` = <NRf> specifies how colors are mapped to the signal density. Range: 0.1 to 10 (the default value is 2).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. The default value of y is 1.

Examples

TRACe5:PHVTIME:COLor:CURVe 1.5 concentrates the resolution on the lower level of the range on the Bitmap display.

TRACe<x>:PHVTime[:MEASview<y>]:COLor:SCALe:AUTO

Automatically adjusts the Max and Min color settings to display the broadest range of colors in the Phase versus Time bitmap display. This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace 5 is valid.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

TRACe<x>:PHVTime[:MEASview<y>]:COLor:SCALe:AUTO

Arguments

<x> = 5 specifies the auto-color setting for the Bitmap trace.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. The default value of y is 1.

Examples

TRACe5:PHVTIME:COLor:SCALe:AUTO autosets the Bitmap display color scheme.

TRACe<x>:PHVTime[:MEASview<y>]:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for the Max or Min Hold trace in the Phase versus Time measurement. This command is effective when TRACe<x>:PHVTime[:MEASview<y>]:FUNCtion is set to MAXHold or MINHold and INITiate:CONTinuous is set to OFF.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:COUNt <number>
TRACe<x>:PHVTime[:MEASview<y>]:COUNt?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

<number>::<NR1> specifies the count for Max/Min Hold.

Range: 1 to 10000.

Examples

`TRACE1:PHVTIME:MEASview1:COUNT 32` sets the count to 32 for the Max/Min Hold trace.

TRACe<x>:PHVTime[:MEASview<y>]:COUNt:ENABle

Determines whether to enable or disable the count for the Max or Min Hold trace in the Phase versus Time view. This command is effective when `TRACe<x>:PHVTime:MEASview<y>:FUNCtion` is set to `MAXHold` or `MINHold`.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:PHVTime[:MEASview<y>]:COUNt:ENABle?
```

Related Commands

Arguments

`<x>` = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`OFF` or 0 disables the count for the Max/Min Hold trace.

`ON` or 1 enables the count for the Max/Min Hold trace.

Examples

`TRACE1:PHVTIME:MEASview1:COUNT:ENABLE ON` enables the Max/Min Hold count.

TRACe<x>:PHVTime[:MEASview<y>]:COUNt:RESet (No Query Form)

Clears the Max or Min Hold data and counter, and restarts the process in the Phase versus Time view. This command is effective when `TRACe<x>:PHVTime:MEASview<y>:FUNCtion` is set to `MAXHold` or `MINHold`.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:COUNt:RESet
```

Arguments

`<x>` = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

Examples

`TRACE1:PHVTIME:MEASview1:COUNT:RESET` clears the Max/Min Hold data and counter, and restarts the process.

TRACe<x>:PHVTime[:MEASview<y>]:DETection

Sets or queries the display detector (method to be used for decimating traces to fit the available horizontal space on screen). The number of horizontal pixels on screen is generally smaller than that of waveform data points. When actually displayed, the waveform data is therefore thinned out, according to the number of pixels, for being compressed.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:DETection { AVERage | POSitive | NEGative | POSNegative | SAMPle }
TRACe<x>:PHVTime[:MEASview<y>]:DETection?
```

Arguments

`<x>` = 1 to 6.

- Trace 4: Math trace (not applicable)
- Trace 5: Bitmap trace (not applicable)
- Trace 6: Ogram

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

`POSNegative` displays the maximum and minimum data values for each pixel.

`SAMPle` displays the first sample value received for each pixel.

Examples

`TRACe1:PHVTime[:MEASview<y>]:DETection POSitive` displays the maximum data value for each pixel.

TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent

Determines whether to enable or disable the dot persistence for the bitmap trace (Trace 5) in the Phase versus Time view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

`TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent { OFF | ON | 0 | 1 }`

`TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent?`

Arguments

`OFF` or `0` disables the dot persistence.

`ON` or `1` enables the dot persistence.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:PHVTIME:DOT:PERSISTENT ON` enables the dot persistence in the Phase versus Time view.

TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:TYPE

Sets or queries the persistence type for the bitmap trace (Trace 5) in the Phase versus Time view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

`TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:TYPE { VARiable | INFinite }`

`TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:TYPE?`

Arguments

`VARiable`: Selects the variable persistence display which leaves acquired data points on the display for a period of time specified by the `TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:VARiable` command.

`INFinite`: Selects the infinite persistence display which accumulates data points on the display indefinitely.

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:PHVTIME:DOT:PERSISTENT:TYPE VARiable` selects the variable persistence display.

TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:VARiable

Sets or queries how long data points are displayed. This command is effective when `TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:TYPE` is set to `VARiable`. This affects the display only.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

`TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:VARiable <number>`

`TRACe<x>:PHVTime[:MEASview<y>]:DOT:PERSistent:VARiable?`

Arguments

`<number>` = <NRf> specifies the how long waveform points are displayed on the screen. Range: 0 s to 1000 s (the default value is 10 ms).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:PHVTIME:DOT:PERSISTENT:VARIABLE 20` specifies that the waveform points are displayed on the screen for a period of 20 before they disappear.

TRACe<x>:PHVTime[:MEASview<y>]:FREeze

Determines whether to freeze the trace display in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:PHVTime[:MEASview<y>]:FREeze?
```

Arguments

`<x>` = 1 to 7.

- Trace 4: Math trace
- Trace 5: Bitmap trace
- Trace 6: Ogram
- Trace 7: Ogram Line

`<y>` = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

`OFF` or 0 updates the trace display normally.

`ON` or 1 stops updating trace display.

Examples

`TRACE1:PHVTIME:MEASview1:FREEZE ON` stops updating trace display.

TRACe<x>:PHVTime[:MEASview<y>]:FUNCtion

Sets or queries the trace function in the Phase versus Time measurement.

Conditions

Measurement views: Phase versus Time

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:FUNCtion { NORMal | AVERage | MAXHold | MINHold }
TRACe<x>:PHVTime[:MEASview<y>]:FUNCtion?
```

Arguments

<x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

<y> = 1 to 8; represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value 1.

NORMal selects the normal waveform display.

AVERage selects the Average display that indicates the average phase drift at each time point.

MAXHold selects the Max Hold display that indicates the maximum phase drift at each time point.

MINHold selects the Min Hold display that indicates the minimum phase drift at each time point.

POSNegative displays the maximum and minimum data values for each pixel.

SAMPle displays the first sample value received for each pixel.

Examples

TRACE1:PHVTIME:MEASview1:FUNCTION MAXHold displays the Max Hold trace in the Phase versus Time measurement.

TRACe<x>:PHVTime[:MEASview<y>]:SELect

Sets or queries the selected trace.

Conditions

Applicable measurement view must be active.

Group

Trace commands

Syntax

```
TRACe<x>:PHVTime[:MEASview<y>]:SELect {ON | OFF | 0 | 1}
TRACe<x>:PHVTime[:MEASview<y>]:SELect?
```

Arguments

ON or 1 selects the specified trace.

The parameter <x> = 1 to 7.

- Trace5: Bitmap Trace
- Trace6: Ogram
- Trace7: Ogram Line

The parameter <y>=1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional by default y is 1

Returns

`0` indicates the specified trace is not the selected trace.

`1` indicates the specified trace is the selected trace.

Examples

`TRACe6:PHVTime:MEASview1:SELect 1` selects Trace6 as the selected trace for measview 1 of Phase vs time.

TRACe<x>:PHVTime[:MEASview<y>]:SELect:LINe

Sets or queries the line number to send to the Phase vs Time ogram display.

Conditions

Applicable measurement view must be active.

Group

Trace commands

Syntax

`TRACe<x>:PHVTime[:MEASview<y>]:SELect:LINe <number>`

`TRACe<x>:PHVTime[:MEASview<y>]:SELect:LINe?`

Related Commands

TRACe<x>:PHVTime[:MEASview<y>] (on page 2652)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

<x> is 6 for ogram trace

`<number>::=<NR1>` specifies the line number to send to the display.

Range: 0 to the maximum line number of the ogram displayed on screen

Returns

`<NRf>` specifies the line number to send to the spectrum display.

Examples

`TRACe6:PHVTime:MEASview1:SELect:LINe 75` selects Line #75 in the ogram to send to the time plot display.

TRACe:SEM:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for multi-trace functions (Max Hold and Average) in the Spectral Emissions Mask measurement. This command is effective when `TRACe:SEM:FUNCtion` is set to `MAXHold` or `AVERage` and `INITiate:CONTinuous` is set to OFF.

Conditions

Measurement views: Spectral Emissions Mask

Group

Trace commands

Syntax

```
TRACe:SEM:COUNt <number>
TRACe:SEM:COUNt?
```

Arguments

`<number>::<NR1>` specifies the count for multi-trace functions.

Range: 1 to 10000.

Examples

`TRACE:SEM:COUNT 32` sets the count to 32 for multi-trace functions.

TRACe:SEM:COUNt:RESet (No Query Form)

Clears the multi-function (Max Hold or Average) data and counter and restarts the process in the Spectral Emissions Mask view. This command is effective when `TRACe:SEM:FUNCtion` is set to `MAXHold` or `AVERage`.

Conditions

Measurement views: Spectral Emissions Mask

Group

Trace commands

Syntax

```
TRACe:SEM:COUNt:RESet
```

Arguments

None

Examples

`TRACE:SEM:COUNT:RESET` clears the multi-function data and counter, and restarts the process.

TRACe:SEM:FUNCtion

Sets or queries the trace function in the Spectral Emissions Mask view.

Conditions

Measurement views: Spectral Emissions Mask

Group

Trace commands

Syntax

```
TRACe:SEM:FUNCtion { NONE | MAXHold | AVERage }
TRACe:SEM:FUNCtion?
```

Arguments

`NONE` selects normal display.

MAXHold selects the Max Hold display that indicates the maximum amplitude drift at each frequency point.

AVERage selects the Average display that indicates the average amplitude drift at each frequency point.

Examples

TRACE:SEM:FUNCTION MAXHold displays the Max Hold trace in the Spectral Emissions Mask measurement.

TRACe:SGRam[:MEASview<y>]:DETection

Sets or queries the display detector (method to be used for decimating traces to fit the available horizontal space on screen). The number of horizontal pixels on screen is generally smaller than that of waveform data points. When actually displayed, the waveform data is therefore thinned out, according to the number of pixels, for being compressed.

Conditions

Measurement views: Spectrogram

Group

Trace commands

Syntax

```
TRACe:SGRam[:MEASview<y>]:DETection { AVERage | POSitive | NEGative | CAVerage | CPEak | QUASipeak
    | AVGLog }
TRACe:SGRam[:MEASview<y>]:DETection?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional The default value of y is 1.

AVERage displays the average data value for each pixel.

POSitive displays the maximum data value for each pixel.

NEGative displays the minimum data value for each pixel.

CAVerage displays the CISPR average value for each pixel.

CPEak displays the CISPR peak value for each pixel.

QUASipeak displays the quasi-peak value for each pixel.

AVGLog displays the average data value of logs for each pixel.

Returns

{AVERage | POSitive | NEGative | CAVerage | CPEak | QUASipeak | AVGLog}

Examples

TRACe:SGRam:MEASview1:DETection POSitive displays the maximum data value for each pixel.

TRACe:SGRam[:MEASview<y>]:FREeze

Determines whether or not to freeze the spectrogram display.

Conditions

Measurement views: Spectrogram

Group

Trace commands

Syntax

```
TRACe:SGRam[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. The default value of y is 1.

OFF or 0 updates the display of the spectrogram normally.

ON or 1 stops updating the display of the spectrogram.

Examples

TRACe:SGRam:MEASview1:FREeze ON freezes the spectrogram display.

TRACe:SGRam[:MEASview<y>]:FUNCtion

NOTE: This function is no longer available in software versions 2.3.0159 and later. Sending this command selects the correct. SENSe:SGRam[:MEASview<y>]:TIME[:SCALe]:MODe and TRACe:SGRam[:MEASview<y>]:DETection to achieve the same result as with previous software versions. The query will return the equivalent trace function based on the MODe and DETection settings.

Sets or queries the trace function for the specified trace in the spectrogram.

Conditions

Measurement views: Spectrogram

Group

Trace commands

Syntax

```
TRACe:SGRam[:MEASview<y>]:FUNCtion { NONE | AVERage | MAXHold | MINHold| AVGLog }
TRACe:SGRam[:MEASview<y>]:FUNCtion?
```

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. The default value of y is 1.

NONE selects the normal spectrogram display.

AVERage selects the Average display that indicates the average signal level at each frequency point.

MAXHold selects the Max Hold display that indicates the maximum signal level at each frequency point.

MINHold selects the Min Hold display that indicates the minimum signal level at each frequency point.

AVGLog selects the Average of logs display that indicates the average signal level of logs at each frequency point.

Returns

{NONE | AVERage | MAXHold | MINHold| AVGLog}

Examples

TRACe:SGRam:MEASview1:FUNCtion MAXHold selects the Max Hold display for the spectrogram.

TRACe:SGRam[:MEASview<y>]:FUNCtion:TIME

NOTE: This command has a new function in software versions 2.3.159 and above. Sets the Spectrum Monitor mode values for Time per update. Sending this command sets `SENSe:SGRam[:MEASview<y>]:TIME:SCALe:PER:UPDate:MINutes` and `SENSe:SGRam[:MEASview<y>]:WATerfall:DIRection` based on the value sent in. The query form returns the number of minutes based on the new settings values.

Conditions

Measurement views: Spectrogram

Group

Trace commands

Syntax

```
TRACe:SGRam[:MEASview<y>]:FUNCtion:TIME <value>
TRACe:SGRam[:MEASview<y>]:FUNCtion:TIME?
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

`<value>::<NR1>` specifies the time length in Spectrum Monitor mode.

Range: 1 to 600 minutes and 60 seconds.

Returns

`<NRf>` specifies the time length in Spectrum Monitor mode.

Examples

`TRACe:SGRam:MEASview1:FUNCtion:TIME 6E2` sets the Time/update value to 600 minutes.

TRACe:SGRam[:MEASview<y>]:RESet

Determines whether or not to reset the spectrogram display.

Conditions

Measurement view: Spectrogram

Group

Trace commands

Syntax

```
TRACe:SGRam[:MEASview<y>]:RESet {OFF | ON | 0 | 1}
```

Arguments

`<y>` = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

`OFF` or 0 does not reset the display of the spectrogram.

`ON` or 1 resets the display of the spectrogram.

Examples

TRACe:SGRam:MEASview1:RESet ON resets the spectrogram measurement view 1 display.

TRACe:SGRam[:MEASview<y>]:SELect:LINE

Sets or queries the line number to send to the spectrum display.

Conditions

Measurement views: Spectrogram

Group

Trace commands

Syntax

```
TRACe:SGRam[:MEASview<y>]:SELect:LINE <number>
TRACe:SGRam[:MEASview<y>]:SELect:LINE?
```

Related Commands

TRACe<x>:SPECtrum (on page 2737)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional by default y is 1.

<number> ::= <NR1> specifies the line number to send to the spectrum display.

Range: 0 to the maximum line number of the spectrogram displayed on screen.

Returns

<NRf> specifies the line number to send to the spectrum display.

Examples

TRACe:SGRam:MEASview1:SELect:LINE 75 selects Line #75 in the spectrogram to send to the spectrum display.

TRACe:SPURious:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for multi-trace functions (Max Hold and Average) in the Spurious measurement. This command is effective when TRACe:SPURious:FUNCtion is set to MAXHold or AVERage and INITiate:CONTinuous is set to OFF.

Conditions

Measurement views: Spurious

Group

Trace commands

Syntax

```
TRACe:SPURious:COUNt <number>
TRACe:SPURious:COUNt?
```

Arguments

<number>::<NR1> specifies the count for multi-trace functions.

Range: 1 to 10000.

Examples

`TRACE:SPURIOUS:COUNT 32` sets the count to 32 for multi-trace functions.

TRACe:SPURious:COUNt:ENABle

Determines whether to enable or disable the count for multi-trace functions (Max Hold and Average) in the Spurious view. This command is effective when `TRACe:SPURious:FUNCtion` is set to `MAXHold` or `AVERage`.

Conditions

Measurement views: Spurious

Group

Trace commands

Syntax

```
TRACe:SPURious:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe:SPURious:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the count for multi-trace functions.

`ON` or 1 enables the count for multi-trace functions.

Examples

`TRACE:SPURIOUS:COUNT:ENABLE ON` enables the count for multi-trace functions.

TRACe:SPURious:COUNt:RESet (No Query Form)

Clears the multi-function (Max Hold or Average) data and counter, and restarts the process in the Spurious view. This command is effective when `TRACe:SPURious:FUNCtion` is set to `MAXHold` or `AVERage`.

Conditions

Measurement views: Spurious

Group

Trace commands

Syntax

```
TRACe:SPURious:COUNt:RESet
```

Arguments

None

Examples

`TRACE:SPURIOUS:COUNT:RESET` clears the multi-function data and counter, and restarts the process.

TRACe:SPURious:FREeze

Determines whether or not to freeze the display of the trace in the Spurious view.

Conditions

Measurement views: Spurious

Group

Trace commands

Syntax

```
TRACe:SPURious:FREeze { OFF | ON | 0 | 1 }
TRACe:SPURious:FREeze?
```

Arguments

`OFF` or 0 updates the display of the trace normally.

`ON` or 1 stops updating the display of the trace.

Examples

`TRACE:SPURIOUS:FREEZE ON` stops updating the display of the trace.

TRACe:SPURious:FUNCtion

Sets or queries the trace function in the Spurious view.

Conditions

Measurement views: Spurious

Group

Trace commands

Syntax

```
TRACe:SPURious:FUNCtion { NONE | MAXHold | AVERage | AVGLog}
TRACe:SPURious:FUNCtion?
```

Arguments

`NONE` selects normal display.

`MAXHold` selects the Max Hold display that indicates the maximum amplitude drift at each frequency point.

`AVERage` selects the Average display that indicates the average amplitude drift at each frequency point.

`AVGLog` selects the Average of logs display that indicates the average amplitude drift of logs at each frequency point.

Examples

`TRACE:SPURIOUS:FUNCTIONMAXHold` displays the Max Hold trace in the Spurious measurement.

TRACe:WLAN:AD:CONSte:TYPE

Sets or queries the trace type in the 802.11ad Constellation display.

Conditions

Measurement view: 802.11ad Constellation

Group

Trace commands

Syntax

```
TRACe:WLAN:AD:CONSte:TYPE { ROTA | REGU }
TRACe:WLAN:AD:CONSte:TYPE?
```

Arguments

`ROTA` is pi/2 Rotated trace type

`REGU` is the Regular trace type

Returns

`ROTA` means the trace type is set to pi/2 rotated

`REGU` means the trace type is set to regular

Examples

`TRACE:WLAN:AD:CONSTE:TYPE ROTA` sets the trace type to PI/2 Rotated.

TRACe:WLAN:AY:CONSte:TYPE

Set or query the Trace Type (Regular or PI/2 Rotated).

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Trace commands

Syntax

```
TRACe:WLAN:AY:CONSte:TYPE { REGU | ROTA }
TRACe:WLAN:AY:CONSte:TYPE?
```

Arguments

`REGU` sets the Trace Type as Regular.

`ROTA` sets the Trace Type as PI/2 Rotated.

Returns

`REGU` means that the Trace Type is Regular.

`ROTA` means that the Trace Type is PI/2 Rotated

Examples

`TRAC:WLAN:AY:CONS:TYPE REGU` sets the Trace Type to Regular.

`TRAC:WLAN:AY:CONS:TYPE?` may return `ROTA`, which means the Trace Type is PI/2 Rotated.

TRACe:WLAN:FLATness:FREeze

Sets or queries whether to freeze the average trace on the WLAN Spectral Flatness display. When the freeze state is turned on, the selected trace stops updating.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe:WLAN:FLATness:FREeze {0|1|OFF|ON}
TRACe:WLAN:FLATness:FREeze?
```

Arguments

`ON` or 1 turns on the freeze state, causing the selected trace to stop updating.

`OFF` or 0 turns off the freeze state.

Returns

Outputs the frozen status of the selected trace as an integral value.

1 indicates a frozen trace and 0 a non-frozen trace.

Examples

`TRAC:WLAN:FLAT:FRE 1` freezes the trace, causing it to stop updating.

TRACe:WLAN:FLATness:SHOW

Displays or hides the trace on the WLAN Spectral Flatness display.

NOTE: WLAN Spectral Flatness is only available for OFDM (non-802.11b) signals.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe:WLAN:FLATness:SHOW {0|1|OFF|ON}
TRACe:WLAN:FLATness:SHOW?
```

Arguments

`ON` or 1 displays the trace.

`OFF` or 0 hides the trace.

Examples

`TRACE:WLAN:FLAT:SHOW 1` turns on the display of the trace.

TRACe1:TOVerview[:MEASview<y>]

Enables display of or queries the display status of the specified trace. Only Trace1 is valid.

Conditions

Measurement views: General Waveform display

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>] { OFF | ON | 0 | 1 }
TRACe1:TOVerview[:MEASview<y>]?
```

Arguments

`OFF` or 0 disables the trace overview.

`ON` or 1 enables the trace overview.

Examples

`TRACe1:TOVerview:MEASVIEW1 ON` shows the trace1 in the Time overview Measurement View 1.

TRACe1:TOVerview[:MEASview<y>]:AVERage:COUNt

Sets or queries the number of traces averaged to generate the specified trace. Only Trace1 is valid.

Conditions

Measurement views: Trace Function set to Average

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:AVERage:COUNt <value>
TRACe1:TOVerview[:MEASview<y>]:AVERage:COUNt?
```

Arguments

`<value>::<NR1>` an integer number of traces to average to create the waveform display.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`TRACe1:TOVerview:MEASview1:AVERage:COUNt 200` sets the Average count for Trace 1 to 200.

TRACe1:TOVerview[:MEASview<y>]:COUNt

Enables or queries the count set for the specified trace. Only Trace1 is valid.

Conditions

Measurement views: Trace Function set to Average

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:COUNt <value>
TRACe1:TOVerview[:MEASview<y>]:COUNt?
```

Arguments

`<value>::<NRf>`

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Returns

`<NRf>`

Examples

`TRACe1:TOVerview:MEASview1:COUNt 200` sets the Trace1 Average count to 200.

TRACe1:TOVerview[:MEASview<y>]:COUNt:ENABle

Enables or queries the Average count for the specified trace. Only Trace1 is valid.

Conditions

Measurement views: Trace Function set to Average

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe1:TOVerview[:MEASview<y>]:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the trace count.

`ON` or 1 enables the trace count.

Examples

`TRACe1:TOVerview:MEASview1:COUNt:ENABle ON` enables the Trace1 Average count.

TRACe1:TOVerview[:MEASview<y>]:COUNt:RESet (No Query Form)

Resets the waveform count for the specified trace. Only Trace1 is valid.

Conditions

Measurement views: Trace Function set to Average

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:COUNt:RESet
```

Arguments

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. Default value is 1.

Examples

`TRACe1:TOVerview:MEASview1:COUNt:RESet` sets the trace count to 1.

TRACe1:TOVerview[:MEASview<y>]:DETection

Enables or queries the type of detection for the specified trace. Only Trace1 is valid.

Conditions

Measurement views: all

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:DETection { AVERage | POSitive | NEGative | POSNegative | SAMPle }
TRACe1:TOVerview[:MEASview<y>]:DETection?
```

Arguments

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

`POSNegative` displays the maximum and minimum data values for each pixel.

`SAMPle` displays the first sample value received for each pixel.

Examples

`TRACe1:TOVerview:MEASview1:DETection POSitive` enables positive detection on Trace1.

TRACe1:TOVerview[:MEASview<y>]:FREeze

Enables or queries a halt to acquisition updates for the specified trace. Only Trace1 is valid.

Conditions

Measurement views: all

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
TRACe1:TOVerview[:MEASview<y>]:FREeze?
```

Arguments

`OFF` or 0 disables the trace freeze function.

`ON` or 1 enables the trace freeze function.

Examples

`TRACe1:TOVerview:MEASview1:FREeze ON` Halts acquisition updates to Trace1.

TRACe1:TOVerview[:MEASview<y>]:FUNCTion

Enables or queries the selected Function for the specified trace. Only Trace1 is valid.

Conditions

Measurement views: all

Group

Trace commands

Syntax

```
TRACe1:TOVerview[:MEASview<y>]:FUNCTion { NORMal | AVERage | MAXHold | MINHold }
TRACe1:TOVerview[:MEASview<y>]:FUNCTion?
```

Arguments

`NORMal` Each new trace is displayed and then replaced by the next trace.

`AVERage` Multiple traces are averaged together to generate the displayed trace.

`MAXHold` Displays the maximum value in the trace record for each display point.

`MINHold` Displays the minimum value in the trace record for each display point.

Examples

`TRACe1:TOVerview:MEASview1:FUNCTion AVERage` enables the averaging of multiple traces on Trace1.

TRACe<x>:{AM|FM|PM}

Determines whether or not to show the trace in the AM/FM/PM view.

Conditions

Measurement views: AM, FM, PM

Group

Trace commands

Syntax

```
TRACe<x>:{AM|FM|PM} { OFF | ON | 0 | 1 }
TRACe<x>:{AM|FM|PM}?
```

Arguments

`OFF` or 0 hides the trace in the AM, FM, or PM view.

`ON` or 1 shows the trace in the AM, FM, or PM view.

Examples

`TRACE:AM ON` shows the trace in the AM view.

TRACe<x>:AVTime[:MEASview<y>]

Determines whether or not to show the specified trace in the Amplitude versus Time view.

The parameter <x> = 1 to 7; All traces are valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>] { OFF | ON | 0 | 1 }
TRACe<x>:AVTime[:MEASview<y>]?
```

Arguments

`OFF` or `0` hides the trace in the Amplitude versus Time view.

`ON` or `1` shows the trace in the Amplitude versus Time view.

<x> = 1 to 7.

- Trace4: Math Trace
- Trace5: Bitmap Trace
- Trace6: Ogram
- Trace7: Ogram Line

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:AVTIME:MEASVIEW1 ON` shows Trace 1 in the Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:AVERage:COUNt

Sets or queries the number of traces to combine. This command is effective when you select AVERage with the `TRACe<x>:AVTime[:MEASview<y>]:FUNCtion` command.

The parameter <x> = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:AVERage:COUNt <number>
TRACe<x>:AVTime[:MEASview<y>]:AVERage:COUNt?
```

Arguments

`<number>::<NR1>` specifies the number of traces to combine for averaging.

Range: 1 to 10000.

The parameter <x> = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE1:AVTIME:MEASVIEW1:AVERAGE:COUNT 64 sets the average count to 64 for Trace 1 for Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:AVERage:RESet (No Query Form)

Restarts acquisition and display of waveforms for the specified trace. For an Average, Max Hold, or Min Hold trace, it restarts the sequence, discarding accumulated data and resetting the counter.

The parameter <x> = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

TRACe<x>:AVTime[:MEASview<y>]:AVERage:RESet

Related Commands

TRACe<x>:AVTime[:MEASview<y>]:FUNCtion (on page 2681)

Arguments

The parameter <x> = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE1:AVTIME:MEASVIEW1:AVERAGE:RESET restarts acquisition and display of waveforms for Trace 1 on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:COLor:CURVe

Sets or queries how colors are mapped to the signal density in the Amplitude versus Time bitmap display. The mapping can be linear (Curve = 1), or it can be set to concentrate the resolution on the lower level of the range (Curve > 1) or the mapping can be set to show the best resolution on the upper range of density or hit count (Curve = 0.1 - 0.99). This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace 5 is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

`TRACe<x>:AVTime[:MEASview<y>]:COLor:CURVe <value>`

`TRACe<x>:AVTime[:MEASview<y>]:COLor:CURVe?`

Arguments

`<value>` = <NRf> specifies how colors are mapped to the signal density. Range: 0.1 to 10 (the default value is 2).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACe5:AVTIME:COLor:CURVe 1.5` concentrates the resolution on the lower level of the range on the Bitmap display.

TRACe<x>:AVTime[:MEASview<y>]:COLor:SCALe:AUTO (No Query Form)

Automatically adjusts the Max and Min color settings to display the broadest range of colors in the Amplitude versus Time bitmap display. This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace 5 is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

`TRACe<x>:AVTime[:MEASview<y>]:COLor:SCALe:AUTO`

Arguments

`<x>` = 5 specifies the auto-color setting for the Bitmap trace.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACe5:AVTIME:COLor:SCALe:AUTO` autosets the Bitmap display color scheme.

TRACe<x>:AVTime[:MEASview<y>]:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for the Max or Min Hold trace in the Amplitude versus Time measurement. This command is effective when `TRACe<x>:AVTime[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold` and `INITiate:CONTinuous` is set to OFF.

The parameter <x> = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:COUNt <number>
TRACe<x>:AVTime[:MEASview<y>]:COUNt?
```

Arguments

`<number>::<NR1>` specifies the count for Max/Min Hold.

Range: 1 to 10000.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:AVTIME:MEASVIEW1:COUNT 32` sets the count to `32` for Trace 1 on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:COUNt:ENABle

Determines whether to enable or disable the count for the Max or Min Hold trace in the Amplitude versus Time view. This command is effective when `TRACe<x>:AVTime[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold`.

The parameter <x> = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:AVTime[:MEASview<y>]:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the count for the Max/Min Hold trace.

`ON` or 1 enables the count for the Max/Min Hold trace.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:AVTIME:MEASVIEW1:COUNT:ENABLE ON` enables the Max/Min Hold count for Trace 1 on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:COUNt:RESet (No Query Form)

Clears the Max or Min Hold data and counter, and restarts the process for the specified trace in the Amplitude versus Time view. This command is effective when `TRACe<x>:AVTime[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold`.

The parameter <x> = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:COUNt:RESet
```

Arguments

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:AVTIME:MEASVIEW1:COUNT:RESET` clears the Max/Min Hold data and counter, and restarts the process for Trace 1 on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:DETection

Sets or queries the display detector (method to be used for decimating traces to fit the available horizontal space on screen). The number of horizontal pixels on screen is generally smaller than that of waveform data points. When actually displayed, the waveform data is therefore thinned out, according to the number of pixels, for being compressed.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:DETection { AVERage | POSitive | NEGative | POSNegative | SAMPle }
TRACe<x>:AVTime[:MEASview<y>]:DETection?
```

Arguments

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

`POSNegative` displays the maximum and minimum data values for each pixel.

`SAMPle` displays the first sample value received for each pixel.

The parameter <x> = 1 to 6.

- Trace 4: Math trace (not applicable)
- Trace 5: Bitmap Trace (not applicable)
- Trace 6: Ogram

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE:AVTIME:MEASVIEW1:DETECTION AVERage` specifies that the trace displays the average data value for each pixel on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent

Determines whether to enable or disable the dot persistence for the bitmap trace (Trace 5) in the Amplitude versus Time view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

`TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent { OFF | ON | 0 | 1 }`

`TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent?`

Arguments

`OFF` or `0` disables the dot persistence.

`ON` or `1` enables the dot persistence.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE5:AVTIME:DOT:PERSISTENT ON` enables the dot persistence in the Amplitude versus Time view.

TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:TYPE

Sets or queries the persistence type for the bitmap trace (Trace 5) in the Amplitude versus Time view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

`TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:TYPE { VARiable | INFinite }`

`TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:TYPE?`

Arguments

`VARiable`: Selects the variable persistence display which leaves acquired data points on the display for a period of time specified by the `TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:VARiable` command.

INFinite: Selects the infinite persistence display which accumulates data points on the display indefinitely.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE5:AVTIME:DOT:PERSISTENT:TYPE VARiable selects the variable persistence display.

TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:VARiable

Sets or queries how long data points are displayed. This command is effective when TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:TYPE is set to VARiable. This affects the display only.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:VARiable <number>

TRACe<x>:AVTime[:MEASview<y>]:DOT:PERSistent:VARiable?

Arguments

<number> = <NRf> specifies the how long waveform points are displayed on the screen. Range: 0 s to 1000 s (the default value is 10 ms).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE5:AVTIME:DOT:PERSISTENT:VARIABLE 20 specifies that the waveform points are displayed on the screen for a period of 20 before they disappear.

TRACe<x>:AVTime[:MEASview<y>]:FREeze

Determines whether or not to freeze the display of the specified trace in the Amplitude versus Time view.

The parameter <x> = 1 to 7; All traces are valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:AVTime[:MEASview<y>]:FREeze?
```

Arguments

OFF or 0 updates the display of the specified trace normally.

ON or 1 stops updating the display of the specified trace.

The parameter <x> = 1 to 7.

- Trace 4: Math trace
- Trace 5: Bitmap trace
- Trace 6: Ogram
- Trace 7: Ogram Line

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE1:AVTIME:MEASVIEW1:FREEZE ON freezes the display for Trace 1 in the Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:FUNCtion

Sets or queries the function for the specified trace in the Amplitude versus Time view.

The parameter <x> = 1 to 3; Trace 4 (math trace) is invalid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:FUNCtion { NORMal | AVERage | MAXHold | MINHold }
TRACe<x>:AVTime[:MEASview<y>]:FUNCtion?
```

Arguments

NORMal selects the normal display.

AVERage selects the Average display that indicates the average amplitude at each time point.

MAXHold selects the Max Hold display that indicates the maximum amplitude at each time point.

MINHold selects the Min Hold display that indicates the minimum amplitude at each time point.

The parameter <x> = 1 to 3.

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE1:AVTIME:MEASVIEW1:FUNCTION MAXHold selects Max Hold for Trace 1 in the Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:LEFToperand

Sets or queries the left operand for the math trace (Trace 4) in the Amplitude versus Time view.

The parameter <x> = 4; Only Trace 4 (math trace) is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:LEFToperand { TRACE1 | TRACE2 | TRACE3 }
TRACe<x>:AVTime[:MEASview<y>]:LEFToperand?
```

Related Commands

TRACe<x>:AVTime[:MEASview<y>]:RIGHtoperand (on page 2682)

Arguments

`TRACe1` selects Trace 1 as the left operand for the math trace.

`TRACe2` selects Trace 2 as the left operand for the math trace.

`TRACe3` selects Trace 3 as the left operand for the math trace.

The parameter <x> = 4; Only Trace 4 (math trace) is valid.

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE2:AVTIME:MEASVIEW1:LEFTOPERAND` selects Trace 2 as the left operand for the math trace for Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:RIGHtoperand

Sets or queries the right operand for the math trace (Trace 4) in the Amplitude versus Time view.

The parameter <x> = 4; Only Trace 4 (math trace) is valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:RIGHtoperand { TRACE1 | TRACE2 | TRACE3 }
TRACe<x>:AVTime[:MEASview<y>]:RIGHtoperand?
```

Related Commands

TRACe<x>:AVTime[:MEASview<y>]:LEFToperand (on page 2681)

Arguments

`TRACe1` selects Trace 1 as the right operand for the math trace.

`TRACe2` selects Trace 2 as the right operand for the math trace.

`TRACe3` selects Trace 3 as the right operand for the math trace.

The parameter <x> = 4; Only Trace 4 (math trace) is valid.

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:AVTIME:MEASVIEW1:RIGHTOPERAND` selects Trace 1 as the right operand for the math trace on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:SELect

Sets or queries the trace whose measurement results are being displayed in the readout on the top and bottom of the view.

The parameter <x> = 1 to 7; All traces are valid.

Conditions

Measurement views: Amplitude versus Time

Group

Trace commands

Syntax

```
TRACe<x>:AVTime[:MEASview<y>]:SELect {ON | 1}
TRACe<x>:AVTime[:MEASview<y>]:SELect?
```

Arguments

`ON` or `1` selects the specified trace

The parameter <x> = 1 to 7.

- Trace5: Bitmap Trace
- Trace6: Ogram
- Trace7: Ogram Line

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Returns

```
{ 0 | 1 }
```

- 0 indicates that the results are not being displayed in the readout for the trace.
- 1 indicates that the results are being displayed in the readout for the trace.

Examples

`TRACE1:AVTIME:MEASVIEW1:SELECT 1` selects Trace 1 to display the measurement results in the readout forAmplitude versus Time Measurement View 1.

`TRACE1:AVTIME:MEASVIEW1:SELECT?` might return `1`, indicating that the results are being displayed in the readout for Trace 1 on Amplitude versus Time Measurement View 1.

TRACe<x>:AVTime[:MEASview<y>]:SELect:LINe

Sets or queries the line number to send to the Ampliude vs Time ogram display.

Conditions

Applicable measurement view must be active.

Group

Trace commands

Syntax

`TRACe<x>:AVTime[:MEASview<y>]:SELect:LINe <number>`

`TRACe<x>:AVTime[:MEASview<y>]:SELect:LINe?`

Related Commands

TRACe<x>:AVTime[:MEASview<y>] (on page 2674)

Arguments

<y> = 1 to 8 represents measurement index based on number of sources of connected instrument. where MEASview keyword is optional. By default y is 1.

<x> = 6 for ogram trace.

`<number>::=<NR1>` specifies the line number to send to the display.

Range: 0 to the maximum line number of the ogram displayed on screen.

Returns

`<NRf>` specifies the line number to send to the spectrum display.

Examples

`TRACe6:AVTime:MEASview1:SELect:LINe 75` selects Line #75 in the ogram to send to the time plot display.

TRACe<x>:BLUEtooth:CONSte

Sets or queries the specified trace to display or hide in the Bluetooth Constellation display.

The parameter <x> is trace 1 or 2.

Conditions

Measurement views: Bluetooth Constellation

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:CONSte { OFF | ON | 0 | 1 }
TRACe<x>:BLUEtooth:CONSte?
```

Arguments

`OFF` or 0 hides the selected trace.

`ON` or 1 displays the selected trace.

Returns

0 indicates the specified trace is not shown in the Bluetooth Constellation display.

1 indicates the specified trace is shown in the Bluetooth Constellation display.

Examples

TRACe1:BLUEtooth:CONSte ON specifies that trace 1 appears in the Bluetooth Constellation display.

TRACe<x>:BLUEtooth:CONSte:FREeze

Sets or queries the specified trace to freeze or not to freeze in the Bluetooth Constellation display.

The parameter <x> is trace 1 or 2.

Conditions

Measurement views: Bluetooth Constellation

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:CONSte:FREeze {OFF | ON | 0 | 1 }
TRACe<x>:BLUEtooth:CONSte:FREeze?
```

Arguments

OFF or 0 updates the display of the selected trace normally.

ON or 1 stops updating the display of the selected trace.

Returns

0 indicates the specified trace is being updated in the Bluetooth Constellation display.

1 indicates the specified trace is not being updated in the Bluetooth Constellation display.

Examples

TRACe1:BLUEtooth:CONSte:FREeze ON freezes the display for trace 1 in the Bluetooth Constellation display.

TRACe<x>:BLUEtooth:CONSte:MODE

Sets or queries the Bluetooth Constellation trace display mode. The parameter <x> is trace 1 or 2.

Conditions

Measurement views: Bluetooth Constellation

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:CONSte:MODE { VECT | SYMB| LIN }
TRACe<x>:BLUEtooth:CONSte:MODE?
```

Arguments

VECT connects adjacent symbol pints with the signal locus.

SYMB displays individual symbol points. LIN displays linear symbol points.

Examples

TRACe1:BLUEtooth:XONSte:MODE VECT shows the Bluetooth Constellation display is connecting adjacent symbol points with the signal locus.

TRACe<x>:BLUEtooth:CONSte:SELect

Sets or queries the active trace in the Bluetooth Constellation diagram. The parameter <x> is trace 1 or 2.

Conditions

Measurement views: Bluetooth Constellation

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:CONSte:SELect <active>
TRACe<x>:BLUEtooth:CONSte:SELect?
```

Arguments

```
<active> ::= {0 | 1}
```

Where:

`0`, the specified trace is not the selected trace.

`1`, the specified trace is the selected trace.

Examples

`TRACe1:BLUEtooth:CONSte:SELect` specifies trace 1 as the selected trace.

TRACe<x>:BLUEtooth:EDIagram:ENABle:I

Determines whether to show or hide the I trace in the Bluetooth eye diagram.

Conditions

Measurement views: Bluetooth Eye diagram

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:EDIagram:ENABle:I { OFF | ON | 0 | 1 }
TRACe<x>:BLUEtooth:EDIagram:ENABle:I?
```

Arguments

`OFF` or 0 hides the I trace.

`ON` or 1 shows the I trace.

Examples

`TRACEX:BLUETOOTH:EDIAGRAM:ENABLE:I ON` shows the I trace in the eye diagram.

TRACe<x>:BLUEtooth:EDIagram:ENABle:Q

Determines whether to show or hide the Q trace in the Bluetooth Eye diagram.

Conditions

Measurement views: Bluetooth Eye diagram

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:EDIagram:ENABle:Q { OFF | ON | 0 | 1 }
TRACe<x>:BLUEtooth:EDIagram:ENABle:Q?
```

Arguments

`OFF` or 0 hides the Q trace.

`ON` or 1 shows the Q trace.

Examples

`TRACEX:BLUETOOTH:EDIAGRAM:ENABLE:Q ON` shows the Q trace in the eye diagram.

TRACe<x>:BLUEtooth:EDIagram:SELect:I

Selects the I trace in the Bluetooth eye diagram. The query version of this command returns whether the I trace is selected or not.

Conditions

Measurement views: Bluetooth Eye diagram

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:EDIagram:SELect:I { 0 | 1 }
TRACe<x>:BLUEtooth:EDIagram:SELect:I?
```

Arguments

None

Returns

0 indicates that the I trace is deselected.

1 indicates that the I trace is selected.

Examples

`TRACEX:BLUETOOTH:EDIAGRAM:SELECT:I` selects the I trace in the eye diagram.

TRACe<x>:BLUEtooth:EDIagram:SELect:Q

Selects the Q trace in the Bluetooth eye diagram. The query version of this command returns whether the I trace is selected or not.

Conditions

Measurement views: Bluetooth Eye diagram

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:EDIagram:SELect:Q { 0 | 1 }
TRACe<x>:BLUEtooth:EDIagram:SELect:Q?
```

Arguments

None

Returns

0 indicates that the Q trace is deselected.

1 indicates that the Q trace is selected.

Examples

`TRACEX:BLUETOOTH:EDIAGRAM:SELECT:Q` selects the Q trace in the eye diagram.

TRACe<x>:BLUEtooth:FDVTime:MODE

Sets or queries whether to display the Frequency Deviation vs. Time trace as vectors or symbols (points).

Conditions

Measurement views: Frequency Deviation vs. Time

Group

Trace commands

Syntax

```
TRACe<x>:BLUEtooth:FDVTime:MODE { VECTors | SYMBols }
TRACe<x>:BLUEtooth:FDVTime:MODE?
```

Arguments

`VECTors` connects adjacent symbol points with lines.

`SYMBols` displays individual symbol points.

Examples

`TRACe:BLUEtooth:FDVTime:MODE VECT` sets the display to connect points in the display with lines.

TRACe<x>:CCDF:FREeze

Determines whether or not to freeze the display of the specified trace (Trace 1 or 2) in the CCDF view.

The parameter <x> = 1 or 2; Trace 3 (Gaussian curve) is invalid.

Conditions

Measurement views: CCDF

Group

Trace commands

Syntax

```
TRACe<x>:CCDF:FREeze { OFF | ON | 0 | 1 }
```

TRACe<x>:CCDF:FREeze?

Arguments

OFF or 0 updates the display of the specified trace normally.

ON or 1 stops updating the display of the specified trace.

Examples

TRACE1:CCDF:FREEZE ON freezes the display for Trace 1.

TRACe<x>:CCDF:SELect

Sets or queries the trace whose measurement results are being displayed in the readout on the top of the view. The selected trace is indicated by the measurement pointer (pink triangle) on the waveform.

The parameter <x> = 1 to 3; All traces are valid.

Conditions

Measurement views: CCDF

Group

Trace commands

Syntax

TRACe<x>:CCDF:SELect
TRACe<x>:CCDF:SELect?

Arguments

None

Returns

{ 0 | 1 }

0 indicates that the results are not being displayed in the readout for the trace.

1 indicates that the results are being displayed in the readout for the trace.

Examples

TRACE1:CCDF:SELECT selects Trace 1 to display the measurement results in the readout.

TRACE1:CCDF:SELECT? might return 1, indicating that the results are being displayed in the readout for Trace 1.

TRACe<x>:CCDF:SHOW

Determines whether to show or hide the specified trace in the CCDF view. The parameter <x> = 1 to 3; All traces are valid.

Conditions

Measurement views: CCDF

Group

Trace commands

Syntax

```
TRACe<x>:CCDF:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:CCDF:SHOW?
```

Arguments

OFF or 0 hides the specified trace.

ON or 1 shows the specified trace.

Examples

TRACE1:CCDF:SHOW ON shows Trace 1 in the CCDF view.

TRACe<x>:CCDF:X

Sets or queries the horizontal position of the measurement pointer (pink triangle) to measure the CCDF. Use the TRACe<x>:CCDF:Y? query to read the value.

The parameter <x> = 1 to 3.

NOTE: Use the TRACe<x>:CCDF:SHOW command to show the specified trace and the TRACe<x>:CCDF:SELect command to select the trace before running the TRACe<x>:CCDF:X command.

Conditions

Measurement views: CCDF

Group

Trace commands

Syntax

```
TRACe<x>:CCDF:X <value>
TRACe<x>:CCDF:X?
```

Arguments

<value>::<NRf> specifies the horizontal position of the measurement pointer.

Range: 0 to 20 dB.

Examples

TRACE1:CCDF:X 5 puts the measurement pointer at 5 dB on Trace 1.

TRACe<x>:CCDF:Y? (Query Only)

Queries the vertical position (CCDF value) of the measurement pointer (displayed as a pink triangle). Use the TRACe<x>:CCDF:X command to set the horizontal position of the pointer.

The parameter <x> = 1 to 3.

NOTE: Use the TRACe<x>:CCDF:SHOW command to show the specified trace and the TRACe<x>:CCDF:SELect command to select the trace before running the TRACe<x>:CCDF:Y? query.

Conditions

Measurement views: CCDF

Group

Trace commands

Syntax

`TRACe<x>:CCDF:Y?`

Arguments

None

Returns

`<value>::<NRf>` is the vertical position (CCDF) of the measurement pointer.

Range: 0 to 100%.

The value of 99.0999953003E+36 is returned if the trace is not available.

Examples

`TRACE1:CCDF:Y?` might return 14.72, indicating the CCDF is 14.72% at the measurement pointer on Trace 1.

TRACe<x>:CONSte[:MEASview<y>]

Specifies whether or not to show the specified trace (Trace 1 or 2) in the Constellation display.

The parameter <x> = 1 or 2.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Trace commands

Syntax

```
TRACe<x>:CONSte[:MEASview<y>] {OFF | ON | 0 | 1 }
TRACe<x>:CONSte[:MEASview<y>]?
```

Arguments

`OFF` or 0 hides the selected trace.

`ON` or 1 displays the selected trace.

Returns

`{ 0 }` indicates the specified trace is not shown in the Constellation display.

`{ 1 }` indicates the specified trace is shown in the Constellation display.

Examples

`TRACe1:CONSTe:MEASview2 2` specifies that Trace 2 be shown in the Constellation display for measview 2 of constellation.

TRACe<x>:CONSte[:MEASview<y>]:FREeze

Specifies whether or not to freeze (halt updates) to the display of the specified trace (Trace 1 or 2) in the Constellation display.

The parameter <x> = 1 or 2.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation) .

Group

Trace commands

Syntax

```
TRACe<x>:CONSte[:MEASview<y>]:FREeze {OFF | ON | 0 | 1 }
TRACe<x>:CONSte[:MEASview<y>]:FREeze?
```

Arguments

`OFF` or 0 updates the display of the specified trace normally.

`ON` or 1 stops updating the display of the specified trace.

Returns

`{ 0 }` indicates the specified trace is being updated.

`{ 1 }` indicates the specified trace is not being updated.

Examples

`TRACe1:CONSTe:MEASview2:FREeze ON` freezes the display for Trace 1 for measview 2 of constellation.

TRACe<x>:CONSte[:MEASview<y>]:MODE

Sets or queries how to display the constellation trace.

The parameter <x> = 1 or 2.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Trace commands

Syntax

```
TRACe<x>:CONSte[:MEASview<y>]:MODE { VECTors | SYMBols }
TRACe<x>:CONSte[:MEASview<y>]:MODE?
```

Arguments

`VECTors` connects adjacent symbol points with the signal locus.

`SYMBols` displays individual symbol points.

Examples

`TRACe<X>:CONSTe:MEASview2:MODE VECTors` shows the constellation connecting adjacent symbol points with the signal locus for measview 2 of constellation.

TRACe<x>:CONSte[:MEASview<y>]:Q:OFFSet

Sets the Q offset in the Constellation display to Use shared Pref, Remove Q offset, or Include Q offset.

The parameter <x> = 1 or 2.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Trace commands

Syntax

```
TRACe<x>:CONSte[:MEASview<y>]:Q:OFFSet { SHARed | RQOFset | IQOFset }
TRACe<x>:CONSte[:MEASview<y>]:Q:OFFSet?
```

Arguments

`SHARed` means that the Q offset applied to the selected trace will be the same as the Remove Q offset setting located on the Prefs tab (which applies to all GP Digital Modulation displays).

Remove Q offset removes the Q offset, possibly overriding the Remove Q offset setting on the Prefs tab. Changing the Constellation display Q Offset value with this command does not affect the Q offset setting on other displays.

Include Q offset includes the Q offset, possibly overriding the Remove Q offset setting on the Prefs tab. Changing the Constellation display Q Offset value with this command does not affect the Q offset setting on other displays.

Returns

`{ SHAR }` indicates that Q Offset is set to Use Shared Pref.

`{ RQOF }` indicates that Q Offset is set to Remove Q Offset.

`{ IQOF }` indicates that Q Offset is set to Include Q Offset.

Examples

`TRACe1:CONSte:MEASview2:Q:OFFSet SHAR` sets the Constellation display Q Offset to Use Shared Pref for measview 2 of constellation.

TRACe<x>:CONSte[:MEASview<y>]:SELect (No query form)

Sets or queries the trace to which the Show, Freeze, Content, and Q Offset settings apply.

The parameter <x> = 1 or 2.

The parameter <y> = 1 to number of instances of a measurement created or number of channels available in an instrument (Example: 1 to 8 channels for MSO58).

Conditions

Measurement views: Constellation

MEASview keyword is optional and applicable only for measurements that supports multi-instance creation of measurement (Example: GPDemod Constellation).

Group

Trace commands

Syntax

```
TRACe<x>:CONSte[:MEASview<y>]:SELect
TRACe<x>:CONSte[:MEASview<y>]:SELect?
```

Arguments

None

Returns

`{ 0 }` indicates the specified trace is not the selected trace.

`{ 1 }` indicates the specified trace is the selected trace.

Examples

`TRACe1:CONSte:MEASview2:SELect` specifies Trace 1 as the selected trace for measview 2 of constellation.

TRACe<x>:DPX

Determines whether or not to show the specified trace in the DPX, Spectrum view.

The parameter <x> = 1 to 7; All traces are valid. Trace 6 is for the DPXogram trace and Trace 7 is for the Ogram line.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX { OFF | ON | 0 | 1 }
TRACe<x>:DPX?
```

Arguments

`OFF` or 0 hides the specified trace in the DPX, Spectrum view.

`ON` or 1 shows the specified trace in the DPX, Spectrum view.

Examples

`TRACE1:DPX ON` shows Trace 1 (the maximum trace) in the DPX, Spectrum view.

TRACe<x>:DPX:AVERage:COUNt

Sets or queries the number of traces to combine for averaging in the DPX, Spectrum view.

The parameter <x> = 3; Only Trace 3 (average trace) is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:AVERage:COUNt <number>
TRACe<x>:DPX:AVERage:COUNt?
```

Arguments

`<number>::<NR1>` specifies the number of traces to combine for averaging.

Range: 1 to 10000.

Examples

`TRACE3:DPX:AVERAGE:COUNT 32` sets the average count to 32.

TRACe<x>:DPX:COLor:CURVe

Sets or queries how colors are mapped to the signal density in the DPX, Spectrum bitmap display. The mapping can be linear (Curve = 1), or it can be set to concentrate the resolution on the lower level of the range (Curve > 1) or the mapping can be set to show the best resolution on the upper range of density or hit count (Curve = 0.1 – 0.99). This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace5 is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:COLor:CURVe <value>
TRACe<x>:DPX:COLor:CURVe?
```

Arguments

`<value>::<NRf>` specifies how colors are mapped to the signal density. Range:

Examples

`TRACe<x>:DPX:COLor:CURVe 1.5` concentrates the resolution on the lower level of the range on the Bitmap display.

TRACe<x>:DPX:COLor:INTensity

Sets or queries the color intensity in the DPX, Spectrum view. The value is common to all traces.

The parameter <x> = 1 to 5; All traces are valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:COLor:INTensity <value>
TRACe<x>:DPX:COLor:INTensity?
```

Arguments

`<value>::<NRf>` specifies color intensity. Range: 1 to 100%.

Examples

`TRACE1:DPX:COLOR:INTENSITY 30` sets the color intensity to 30%.

TRACe<x>:DPX:COLor:SCALe:AUTO (No Query Form)

Automatically adjusts the Max and Min color settings to display the broadest range of colors in the DPX, Spectrum bitmap display. This command is only valid for the Bitmap display.

The parameter <x> = 5; only Trace5 is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:COLor:SCALe:AUTO
```

Arguments

`<x>::=5` specifies the auto-color setting for the Bitmap trace.

Examples

`TRACe5:DPX:COLor:SCALe:AUTO` autosets the Bitmap display color scheme.

TRACe<x>:DPX:DETection

Sets or queries the detection type (POSitive, NEGative, AVERage) for traces 1, 2 and 3 in the DPX, Spectrum view.

Trace 4 (math trace) and Trace 5 (bitmap trace) are invalid choices. Trace 6 is only valid for DPXogram.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:DETection { AVERage | NEGative | POSitive }
```

TRACe<x>:DPX:DETection?

Arguments

The following table shows the trace function and display. For the average trace, use the TRACe<x>:DPX:AVERage:COUNt command to set the average count.

Examples

TRACE1:DPX:DETection AVERage enables analysis to look for AVERage on Trace 1.

TRACe<x>:DPX:DGRAM:SELect:LINE

Sets or queries a line from the DPXogram display to send to the DPX, Spectrum display.

Trace 6 is the DPXogram trace. No other traces are allowed.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

TRACe<x>:DPX:DGRAM:SELect:LINE <number>
TRACe<x>:DPX:DGRAM:SELect:LINE?

Arguments

<number> ::= <NR1> specifies the line number in the DPXogram display.

Examples

TRACE6:DPX:DGRAM:SELECT:LINE 75 selects line #75 in the DPXogram display to send to the DPX, Spectrum display.

TRACe<x>:DPX:DOT:PERSistent

Determines whether to enable or disable the dot persistence for the bitmap trace (Trace 5) in the DPX, Spectrum view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

TRACe<x>:DPX:DOT:PERSistent { OFF | ON | 0 | 1 }
TRACe<x>:DPX:DOT:PERSistent?

Arguments

OFF or 0 disables the dot persistence.

ON or 1 enables the dot persistence.

Examples

`TRACE5:DPX:DOT:PERSISTENT ON` enables the dot persistence in the DPX, Spectrum view.

TRACe<x>:DPX:DOT:PERSistent:TYPE

Sets or queries the persistence type for the bitmap trace (Trace 5) in the DPX, Spectrum view.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:DOT:PERSistent:TYPE { VARiable | INFinite }
TRACe<x>:DPX:DOT:PERSistent:TYPE?
```

Arguments

`VARiable` selects the variable persistence display which leaves acquired data points on the display for a period of time specified by the `TRACe<x>:DPX:DOT:PERSistent:VARiable` command.

`INFinite` selects the infinite persistence display which accumulates data points on the display indefinitely.

Examples

`TRACE5:DPX:DOT:PERSISTENT:TYPE VARiable` selects the variable persistence display.

TRACe<x>:DPX:DOT:PERSistent:VARiable

Sets or queries how long data points are displayed. This command is effective when `TRACe<x>:DPX:DOT:PERSistent:TYPE` is set to `VARiable`. This affects the display only.

The parameter <x> = 5; Only Trace 5 (bitmap trace) is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:DOT:PERSistent:VARiable <number>
TRACe<x>:DPX:DOT:PERSistent:VARiable?
```

Arguments

`<number>::<NR1>` specifies the how long waveform points are displayed on the screen. Range: 100 ms to 60 s (the default value is 1.0 s).

Examples

`TRACE5:DPX:DOT:PERSISTENT:VARIABLE 20` specifies that the waveform points are displayed on the screen for a period of 20 before they disappear.

TRACe<x>:DPX:FREeze

Determines whether or not to freeze the display of the specified trace in the DPX, Spectrum view.

The parameter <x> = 1 to 6; All traces are valid. Trace 6 is for the DPXogram trace and Trace 7 is for the Ogram line.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:DPX:FREeze?
```

Arguments

`OFF` or 0 updates the display of the specified trace normally.

`ON` or 1 stops updating the display of the specified trace.

Examples

`TRACE1:DPX:FREEZE ON` freezes the display for the +peak trace.

TRACe<x>:DPX:FUNCtion

Sets or queries the trace function for the +Peak, -Peak, or Average trace (Trace 1, 2, or 3, respectively) in the DPX, Spectrum view.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (bitmap trace) are invalid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:FUNCtion { NORMal | HOLD | AVERage }
TRACe<x>:DPX:FUNCtion?
```

Arguments

The following table shows the trace function and display. For the average trace, use the `TRACe<x>:DPX:AVERage:COUNt` command to set the average count.

Function	Trace1 (+Peak trace)	Trace1 (+Peak trace)	Trace3 (Average trace)
NORMal	Normal spectrum (Detection: +Peak)	Normal spectrum (Detection: -Peak)	Normal spectrum (Detection: Average)
HOLD	Max-hold spectrum	Min-hold spectrum	NA
AVERage	NA	NA	Average spectrum

Examples

`TRACE1:DPX:FUNCTION HOLD` selects the max hold waveform for Trace 1.

TRACe<x>:DPX:LEFToperand

Sets or queries the left operand for the math trace (Trace 4) in the DPX, Spectrum view.

The parameter <x> = 4; Only Trace 4 (math trace) is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:LEFToperand { TRACe1 | TRACe2 | TRACe3 }
TRACe<x>:DPX:LEFToperand?
```

Related Commands

TRACe<x>:DPX:RIGHtoperand (on page 2700)

Arguments

`TRACE1` selects Trace 1 as the left operand for the math trace.

`TRACE2` selects Trace 2 as the left operand for the math trace.

`TRACE3` selects Trace 3 as the left operand for the math trace.

Examples

`TRACE4:DPX:LEFTOPERAND TRACE2` selects Trace 2 as the left operand for the math trace.

TRACe<x>:DPX:RIGHtoperand

Sets or queries the right operand for the math trace (Trace 4) in the DPX, Spectrum view.

The parameter <x> = 4; Only Trace 4 (math trace) is valid.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:RIGHtoperand { TRACE1 | TRACE2 | TRACE3 }
TRACe<x>:DPX:RIGHtoperand?
```

Related Commands

TRACe<x>:DPX:LEFToperand (on page 2700)

Arguments

`TRACE1` selects Trace 1 as the right operand for the math trace.

TRACE2 selects Trace 2 as the right operand for the math trace.

TRACE3 selects Trace 3 as the right operand for the math trace.

Examples

TRACE4:DPX:RIGHTOPERAND TRACE1 selects Trace 1 as the right operand for the math trace.

TRACe<x>:DPX:SELect

Sets or queries the trace to display the readout at the upper left of the DPX, Spectrum view.

The parameter <x> = 1 to 7; All traces are valid. Trace 6 is for the DPXogram trace and Trace 7 is for the Ogram line.

Conditions

Measurement views: DPX, Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:DPX:SELect
TRACe<x>:DPX:SELect?
```

Arguments

None

Returns

{ 0 | 1 }

- 0 indicates that the readout is not being displayed for the specified trace.
- 1 indicates that the readout is being displayed for the specified trace.

Examples

TRACE1:DPX:SELECT selects Trace 1 (+Peak trace) to display the readout.

TRACE1:DPX:SELECT? might return 1, indicating that the readout is being displayed for Trace 1.

TRACe<x>:EMC:RECAll:ENABle

Sets or queries that selected recalled trace is enabled (displayed) or disabled in EMC View.

<x> = <NR1> either 1,2,3,4,5 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:RECAll:ENABle {0 | OFF | 1 | ON}
TRACe<x>:EMC:RECAll:ENABle?
```

Arguments

0 or OFF indicates recalled trace is disabled 1 or ON indicates recalled trace is enabled

Returns

<Boolean> 0,1

Examples

TRACe4:EMC:RECAll:ENABle might return 1, indicating that the recalled trace 4 is enabled (displayed).

TRACe<x>:EMC:RECAll:SELect

Sets or queries the selection of specified recalled trace in live trace of EMC View.

<x> = <NR1> either 1,2,3,4,5 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:RECAll:SELect
TRACe<x>:EMC:RECAll:SELect?
```

Arguments

None

Returns

<Boolean> 0,1

Examples

TRACe3:EMC:RECAll:SELect might return 1, indicating that recalled trace 3 is selected.

TRACe<x>:EMC:SCAN:COUNt

Sets or queries the count value of specified scan trace in EMC View.

<x> = <NR1> 1 or 2 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:SCAN:COUNt <value>
TRACe<x>:EMC:SCAN:COUNt?
```

Arguments

<value> = <NR1>

Returns

<NR1>

Examples

TRACe1:EMC:SCAN:COUNt might return 12, indicating the count value for trace 1 is 12.

TRACe<x>:EMC:SCAN:COUNt:RESet (No Query Form)

Resets the count value of the specified live scan trace in EMC view.

<x> = <NR1> 1 or 2 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Mass Memory commands

Syntax

TRACe<x>:EMC:SCAN:COUNt:RESet

Arguments

None

Returns

None

Examples

TRACe2:EMC:SCAN:COUNt:RESet resets the count value of live scan trace 2.

TRACe<x>:EMC:SCAN:ENABle

Sets or queries that selected scan trace is enabled (displayed) or disabled in EMC View.

<x> = <NR1> 1 or 2 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:SCAN:ENABle { 0 | OFF | 1 | ON}
TRACe<x>:EMC:SCAN:ENABle?
```

Arguments

0 or OFF indicates the scan trace is disabled. 1 or ON indicates the scan trace is enabled.

Returns

<Boolean> 0,1

Examples

`TRACe1:EMC:SCAN:ENABle?` might return `1`, indicating that the scan trace 1 is enabled (displayed).

TRACe<x>:EMC:SCAN:FUNCtion

Sets or queries the scan function for the selected scan trace in EMC View.

<x> = <NR1>1 or 2 Trace number

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:SCAN:FUNCtion {NONE | MAXH | AVER | AVGL}
TRACe<x>:EMC:SCAN:FUNCtion?
```

Arguments

`NONE` = Normal is the function selected MAXH = Max Hold is the function selected AVER = Avg(VRMS) is the function selected

`AVGL` = Avg (of logs) is the function selected

Returns

`<String>` See Arguments

Examples

`TRACe1:EMC:SCAN:ENABle?` might returns `MAXH`, indicating that the scan function selected for trace 1 is Max Hold.

TRACe<x>:EMC:SCAN:SELect

Sets or queries the selection of scan trace in live trace of EMC View.

<x> = <NR1>1 or 2 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:SCAN:SELect
TRACe<x>:EMC:SCAN:SELect?
```

Arguments

None

Returns

`<Boolean>` 0,1

Examples

`TRACe1:EMC:SCAN:SELect` might return `1`, indicating that scan trace 1 is selected.

TRACe<x>:EMC:SPOT:ENABle

Sets or queries that selected spot trace is enabled (displayed) or disabled in EMC View.

<x> = <NR1> either 1 , 2 or 3 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:SPOT:ENABle {0 | OFF | 1 | ON}
TRACe<x>:EMC:SPOT:ENABle?
```

Arguments

`0` or `OFF` indicates spot trace is disabled 1 or ON indicates spot trace is enabled

Returns

`<Boolean>` 0,1

Examples

`TRACe2:EMC:SPOT:ENABle` might return 1, indicating that the spot trace 2 is enabled (displayed).

TRACe<x>:EMC:SPOT:SELect

Sets or queries the selection of spot trace in live trace of EMC View.

<x> = <NR1> either 1 , 2 or 3 (trace number)

Conditions

Measurement view: EMC - EMI Display

Group

Trace commands

Syntax

```
TRACe<x>:EMC:SPOT:SELect
TRACe<x>:EMC:SPOT:SELect?
```

Arguments

None

Returns

`<Boolean>` 0,1

Examples

`TRACe1:EMC:SPOT:SELect` might return 1, indicating that spot trace 1 is selected.

TRACe<x>:{FSETtling|PSETtling}:FREeze

Determines whether to freeze the specified trace in the Settling Time measurement display.

The parameter <x> = 1 or 2.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe<x>:{FSETtling|PSETtling}:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:{FSETtling|PSETtling}:FREeze?
```

Arguments

`OFF` or 0 updates the trace display normally.

`ON` or 1 stops updating trace display.

Examples

`TRACE1:FSETTLING:FREEZE ON` stops updating the Trace 1 display.

TRACe<x>:{FSETtling|PSETtling}:SELect

Selects the trace in the settling time measurement. The query returns the currently selected trace.

The parameter <x> = 1 or 2.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe<x>:{FSETtling|PSETtling}:SELect
TRACe<x>:{FSETtling|PSETtling}:SELect?
```

Arguments

None

Returns

0 (not selected) or 1 (selected).

Examples

`TRACE2:FSETTLING:SELECT` selects Trace 2.

TRACe<x>:{FSETtling|PSETtling}:SHOW

Determines whether to show or hide the specified trace in the settling time view. The parameter <x> = 1 or 2.

Conditions

Measurement views: Frequency and Phase Settling Time

Group

Trace commands

Syntax

```
TRACe<x>:{FSETtling|PSETtling}:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:{FSETtling|PSETtling}:SHOW?
```

Arguments

`OFF` or 0 hides the specified trace.

`ON` or 1 shows the specified trace.

Examples

`TRACE1:PSETTLING:SHOW ON` shows Trace 1 in the Phase Settling Time view.

TRACe<x>:LTE:ACLR:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for multitrace functions (Max Hold and Average) in the LTE ACLR measurement. This command is effective when `TRACe<x>: LTE:ACLR:FUNCtion` is set to `MAXHold` or `AVERage` and `INITiate:CONTinuous` is set to OFF.

Conditions

Measurement view: LTE ACLR

Group

Trace commands

Syntax

```
TRACe<x>:LTE:ACLR:COUNt <number>
```

Related Commands

TRACe<x>:LTE:ACLR:FUNCtion (on page 2708)

Arguments

`<number>::<NR1>` specifies the count for multi-trace functions. Range: 1 to 10000.

Returns

`<NR1>`

Examples

`TRACE1:LTE:ACLR:COUNT 32` sets the count to 32 for multitrace functions.

TRACe<x>:LTE:ACLR:COUNt:RESet (No Query Form)

Clears the multifunction (Max Hold or Average) data and counter and restarts the process in the LTE ACLR display. This command is effective when `TRACe<x>:LTE:ACLR:FUNCtion` is set to `MAXHold` or `AVERage`.

Conditions

Measurement view: LTE ACLR

Group

Trace commands

Syntax

```
TRACe<x>:LTE:ACLR:COUNt:RESet
```

Related Commands

TRACe<x>:LTE:ACLR:FUNCtion (on page 2708)

Arguments

None

Examples

`TRACE1:LTE:ACLR:COUNT:RESET` clears the multifunction data and counter, and restarts the process.

TRACe<x>:LTE:ACLR:FUNCtion

Sets or queries the trace function in the LTE ACLR display.

Conditions

Measurement view: LTE ACLR

Group

Trace commands

Syntax

```
TRACe<x>:LTE:ACLR:FUNCtion { NONE | MAXH | AVER }
TRACe<x>:LTE:ACLR:FUNCtion?
```

Arguments

`NONE` sets Normal display of Trace 1.

`MAXHold` sets Max Hold display of Trace 1, which indicates the maximum amplitude drift at each frequency point.

`AVERage` sets Average display of Trace 1, which indicates the average amplitude drift at each frequency point.

Returns

`NONE` means that Trace 1 is set to Normal display. `MAXHold` means Trace 1 is set to Max Hold display. `AVERage` means Trace 1 is set to Average display.

Examples

`TRACE1:LTE:ACLR:FUNCTION MAXH` displays the Max Hold trace in the LTE ACLR display.

TRACe<x>:LTE:CONSte:SYNChronization:SEQUence:STATe? (Query Only)

Returns whether or not a measurement signal (Primary Synchronization Signal/Secondary Synchronization Signal) is selected for the specified trace in the Trace tab of the settings control panel of the LTE Constellation display.

Conditions

Measurement view: LTE Constellation

Group

Trace commands

Syntax

```
TRACe<x>:LTE:CONSte:SYNChronization:SEQUence:STATe?
```

Returns

0 means no measurement signal is selected.

1 means a measurement signal is selected.

Examples

`TRACE1:LTE:CONSTE:SYNCHRONIZATION:SEQUENCE:STATE?` might return `1`, indicating that SSS or PSS is selected in the Trace tab of the LTE Constellation display.

TRACe<x>:NOISe:FIGure:AVERage:COUNt

Sets or queries the average counts for the specified trace in the Noise Figure display.

Conditions

Measurement view: Noise Figure

The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:AVERage:COUNt <NR1>
TRACe<x>:NOISe:FIGure:AVERage:COUNt?
```

Arguments

`<NR1> = integer`

Range: 2 to 10000

Returns

`<NR3>` floating point value with an exponent, which is the average count value.

Examples

`TRAC1:NOIS:FIG:AVER:COUN?` might return `10.0000000000E+3`, indicating that the average count value is set to 10000.

TRACe<x>:NOISe:FIGure:COUNt:ENABle

Sets or queries whether or not the count feature for the specified trace in the Noise Figure display is enabled or disabled.

Conditions

Measurement view: Noise Figure display The parameter <x>= 1 to 3.

Only available when trace Function is set to Avg (VRMS), Max Hold, or Min Hold.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:FIGure:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the count feature for the specified trace.

`ON` or 1 enables the count feature for the specified trace.

Returns

0 indicates the count feature for the specified trace if disabled.

1 indicates the count feature for the specified trace if enabled.

Examples

`TRAC1:NOIS:FIG:COUN:ENAB ON` enables the count feature for Trace 1.

`TRAC1:NOIS:FIG:COUN:ENAB?` might return `0`, indicating that the count feature for Trace 1 is disabled.

TRACe<x>:NOISe:FIGure:DETection

Sets or queries the trace detection method in the Noise Figure display.

Conditions

Measurement view: Noise Figure display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:DETection { AVERage }
TRACe<x>:NOISe:FIGure:DETection?
```

Arguments

`AVERage`: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

Returns

`AVER` means that the trace function is set to Average (VRMS).

Examples

`TRACE1:NOIS:FIG:DET AVER` sets the detection method for Trace 1 to Average (VRMS).

`TRACE2:NOIS:FIG:DET?` might return `AVER`, indicating that the function for Trace 1 is set to Average (VRMS).

TRACe<x>:NOISe:FIGure:FREeze

Specifies whether or not to freeze (halt updates of) the specified trace in the Noise Figure display.

Conditions

Measurement view: Noise Figure display

The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:FIGure:FREeze?
```

Arguments

`OFF` or 0 normally updates the display of the specified trace.

`ON` or 1 stops updating the display of the specified trace.

Returns

0 indicates the specified trace is being updated normally in the Noise Figure display.

1 indicates the specified trace is not being updated in the Noise Figure display.

Examples

`TRAC1:NOIS:FIG:FRE ON` freezes the display of Trace 1.

`TRAC1:NOIS:FIG:FRE?` might return `0`, indicating that the display of Trace 1 is set to Freeze.

TRACe<x>:NOISe:FIGure:FUNCtion

Sets or queries the trace processing method (function) in the Noise Figure display.

Conditions

Measurement view: Noise Figure display

The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:FUNCtion { NORMal | AVERage | MAXHold| MINHold}
TRACe<x>:NOISe:FIGure:FUNCtion?
```

Arguments

`NORMal`: Displays the trace record for each display point without additional processing.

AVERage: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

MAXHold: Displays the maximum value in the trace record for each display point.

MINHold: Displays the minimum value in the trace record for each display point.

Returns

NORM means that the trace function is set to Normal.

AVER means that the trace function is set to Average (VRMS).

MAXH means that the trace function is set to Max Hold.

MINH means that the trace function is set to Min Hold.

Examples

TRAC1:NOIS:FIG:FUNC NORM sets the function for Trace 1 to Normal.

TRAC2:NOIS:FIG:FUNC? might return MAXH, indicating that the function for Trace 1 is set to Max Hold.

TRACe<x>:NOISe:FIGure:SELect

Sets the trace to be shown in the Noise Figure display. The query form of this command returns whether or not the specified trace is set to show (ON) or not (OFF).

Conditions

Measurement view: Noise Figure display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:SELect
TRACe<x>:NOISe:FIGure:SELect?
```

Arguments

None

Returns

0 means that the specified trace is not shown (set to Off).

1 means that the specified trace is set to show (set to normal).

Examples

TRAC1:NOIS:FIG:SEL will set the display to show Trace 1.

TRAC2:NOIS:FIG:SEL? might return 1, indicating that Trace 2 is set to show.

TRACe<x>:NOISe:FIGure:SHOW

Sets or queries the state (shown or not shown) of the specified trace in the Noise Figure display.

Conditions

Measurement view: Noise Figure display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:FIGure:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:FIGure:SHOW?
```

Arguments

`OFF` or 0 hides the specified trace.

`ON` or 1 displays the specified trace.

Returns

0 indicates the specified trace is not shown in the Noise Figure display.

1 indicates the specified trace is shown in the Noise Figure display.

Examples

`TRAC1:NOIS:FIG:SHOW` sets Trace to show in the Noise Figure display.

`TRAC2:NOIS:FIG:SHOW?` might return `0`, indicating that Trace 2 is not showing in the Noise Figure display.

TRACe<x>:NOISe:GAIN:AVERage:COUNt

Sets or queries the average counts for the specified trace in the Gain display.

Conditions

Measurement view: Gain

The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:AVERage:COUNt <NR1>
TRACe<x>:NOISe:GAIN:AVERage:COUNt?
```

Arguments

`<NR1> = integer`

Range: 2 to 10000

Returns

`<NR3>` floating point value with an exponent, which is the average count value.

Examples

`TRAC1:NOIS:GAIN:AVER:COUN?` might return `10.0000000000E+3`, indicating that the average count value is set to 10000.

TRACe<x>:NOISe:GAIN:COUNt:ENABle

Sets or queries whether or not the count feature for the specified trace in the Gain display is enabled or disabled.

Conditions

Measurement view: Gain display

The parameter <x>= 1 to 3.

Only available when trace Function is set to Avg (VRMS), Max Hold, or Min Hold.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:GAIN:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the count feature for the specified trace.

`ON` or 1 enables the count feature for the specified trace.

Returns

0 indicates the count feature for the specified trace if disabled.

1 indicates the count feature for the specified trace if enabled.

Examples

`TRAC1:NOIS:GAIN:COUN:ENAB ON` enables the count feature for Trace 1.

`TRAC1:NOIS:GAIN:COUN:ENAB?` might return `0`, indicating that the count feature for Trace 1 is disabled.

TRACe<x>:NOISe:GAIN:DETection

Sets or queries the trace detection method in the Gain display.

Conditions

Measurement view: Gain display

The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:DETection { AVERage }
TRACe<x>:NOISe:GAIN:DETection?
```

Arguments

`AVERage`: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

Returns

AVER means that the trace function is set to Average (VRMS).

Examples

`TRACE1:NOIS:YFAC:DET AVER` sets the detection method for Trace 1 to Average (VRMS).

`TRACE2:NOIS:YFAC:DET?` might return `AVER`, indicating that the function for Trace 1 is set to Average (VRMS).

TRACe<x>:NOISe:GAIN:FREeze

Specifies whether or not to freeze (halt updates of) the specified trace in the Gain display.

Conditions

Measurement view: Gain display

The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:GAIN:FREeze?
```

Arguments

`OFF` or 0 normally updates the display of the specified trace.

`ON` or 1 stops updating the display of the specified trace.

Returns

0 indicates the specified trace is being updated normally in the Gain display.

1 indicates the specified trace is not being updated in the Gain display.

Examples

`TRAC1:NOIS:GAIN:FRE ON` freezes the display of Trace 1.

`TRAC1:NOIS:GAIN:FRE?` might return `0`, indicating that the display of Trace 1 is set to Freeze.

TRACe<x>:NOISe:GAIN:FUNCtion

Sets or queries the trace processing method (function) in the Gain display.

Conditions

Measurement view: Gain display

The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:FUNCtion { NORMal | AVERage | MAXHold| MINHold}
TRACe<x>:NOISe:GAIN:FUNCtion?
```

Arguments

NORMal: Displays the trace record for each display point without additional processing.

AVERage: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

MAXHold: Displays the maximum value in the trace record for each display point.

MINHold: Displays the minimum value in the trace record for each display point.

Returns

NORM means that the trace function is set to Normal.

AVER means that the trace function is set to Average (VRMS).

MAXH means that the trace function is set to Max Hold.

MINH means that the trace function is set to Min Hold.

Examples

TRAC1:NOIS:GAIN:FUNC NORM sets the function for Trace 1 to Normal.

TRAC2:NOIS:GAIN:FUNC? might return MAXH, indicating that the function for Trace 1 is set to Max Hold.

TRACe<x>:NOISe:GAIN:SELect

Sets the trace to be shown in the Gain display. The query form of this command returns whether or not the specified trace is set to show (ON) or not (OFF).

Conditions

Measurement view: Gain display

The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:SELect
TRACe<x>:NOISe:GAIN:SELect?
```

Arguments

None

Returns

0 means that the specified trace is not shown (set to Off).

1 means that the specified trace is set to show (set to normal).

Examples

TRAC1:NOIS:GAIN:SEL will set the display to show Trace 1.

TRAC2:NOIS:GAIN:SEL? might return 1, indicating that Trace 2 is set to show.

TRACe<x>:NOISe:GAIN:SHOW

Sets or queries the state (shown or not shown) of the specified trace in the Gain display.

Conditions

Measurement view: Gain display

The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:GAIN:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:GAIN:SHOW?
```

Arguments

`OFF` or 0 hides the specified trace.

`ON` or 1 displays the specified trace.

Returns

0 indicates the specified trace is not shown in the Gain display.

1 indicates the specified trace is shown in the Gain display.

Examples

`TRAC1:NOIS:GAIN:SHOW` sets Trace to show in the Gain display.

`TRAC2:NOIS:GAIN:SHOW?` might return `0`, indicating that Trace 2 is not showing in the Gain display.

TRACe<x>:NOISe:TEMPerature:AVERage:COUNt

Sets or queries the average counts for the specified trace in the Noise Temperature display.

Conditions

Measurement view: Noise Temperature The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:TEMPerature:AVERage:COUNt <NR1>
TRACe<x>:NOISe:TEMPerature:AVERage:COUNt?
```

Arguments

`<NR1> = integer`

Range: 2 to 10000

Returns

`<NR3>` floating point value with an exponent, which is the average count value.

Examples

TRAC1:NOIS:TEMP:AVER:COUN? might return 10.0000000000E+3, indicating that the average count value is set to 10000.

TRACe<x>:NOISe:TEMPerature:COUNt:ENABle

Sets or queries whether or not the count feature for the specified trace in the Noise Temperature display is enabled or disabled.

Conditions

Measurement view: Noise Temperature display The parameter <x>= 1 to 3.

Only available when trace Function is set to Avg (VRMS), Max Hold, or Min Hold.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:TEMPerature:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:TEMPerature:COUNt:ENABle?
```

Arguments

OFF or 0 disables the count feature for the specified trace.

ON or 1 enables the count feature for the specified trace.

Returns

0 indicates the count feature for the specified trace if disabled.

1 indicates the count feature for the specified trace if enabled.

Examples

TRAC1:NOIS:TEMP:COUN:ENAB ON enables the count feature for Trace 1.

TRAC1:NOIS:TEMP:COUN:ENAB? might return 0, indicating that the count feature for Trace 1 is disabled.

TRACe<x>:NOISe:TEMPerature:DETection

Sets or queries the trace detection method in the Noise Temperature display.

Conditions

Measurement view: Noise Temperature display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:TEMPerature:DETection { AVERage }
TRACe<x>:NOISe:TEMPerature:DETection?
```

Arguments

AVERage: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

Returns

AVER means that the trace function is set to Average (VRMS).

Examples

TRAC1:NOIS:TEMP:DET AVER sets the detection method for Trace 1 to Average (VRMS).

TRAC2:NOIS:TEMP:DET? might return AVER, indicating that the function for Trace 1 is set to Average (VRMS).

TRACe<x>:NOISE:TEMPerature:FREeze

Specifies whether or not to freeze (halt updates of) the specified trace in the Noise Temperature display.

Conditions

Measurement view: Noise Temperature display The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISE:TEMPerature:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:NOISE:TEMPerature:FREeze?
```

Arguments

OFF or 0 normally updates the display of the specified trace.

ON or 1 stops updating the display of the specified trace.

Returns

0 indicates the specified trace is being updated normally in the Noise Temperature display.

1 indicates the specified trace is not being updated in the Noise Temperature display.

Examples

TRAC1:NOIS:TEMP:FRE ON freezes the display of Trace 1.

TRAC1:NOIS:TEMP:FRE? might return 0, indicating that the display of Trace 1 is set to Freeze.

TRACe<x>:NOISe:TEMPerature:FUNCtion

Sets or queries the trace processing method (function) in the Noise Temperature display.

Conditions

Measurement view: Noise Temperature display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:TEMPerature:FUNCtion { NORMal | AVERage | MAXHold | MINHold}
TRACe<x>:NOISe:TEMPerature:FUNCtion?
```

Arguments

NORMal: Displays the trace record for each display point without additional processing.

AVERage: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

MAXHold: Displays the maximum value in the trace record for each display point.

MINHold: Displays the minimum value in the trace record for each display point.

Returns

NORM means that the trace function is set to Normal.

AVER means that the trace function is set to Average (VRMS).

MAXH means that the trace function is set to Max Hold.

MINH means that the trace function is set to Min Hold.

Examples

TRAC1:NOIS:TEMP:FUNC NORM sets the function for Trace 1 to Normal.

TRAC2:NOIS:TEMP:FUNC? might return MAXH, indicating that the function for Trace 1 is set to Max Hold.

TRACe<x>:NOISe:TEMPerature:SELect

Sets the trace to be shown in the Noise Temperature display. The query form of this command returns whether or not the specified trace is set to show (On) or not (Off).

Conditions

Measurement view: Noise Temperature display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:TEMPerature:SELect
TRACe<x>:NOISe:TEMPerature:SELect?
```

Arguments

None

Returns

0 means that the specified trace is not shown (set to Off).

1 means that the specified trace is set to show (set to normal).

Examples

TRAC1:NOIS:TEMP:SEL will set the display to show Trace 1.

TRAC2:NOIS:TEMP:SEL? might return 1, indicating that Trace 2 is set to show.

TRACe<x>:NOISe:TEMPerature:SHOW

Sets or queries the state (shown or not shown) of the specified trace in the Noise Temperature display.

Conditions

Measurement view: Noise Temperature display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:TEMPerature:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:TEMPerature:SHOW?
```

Arguments

`OFF` or 0 hides the specified trace.

`ON` or 1 displays the specified trace.

Returns

0 indicates the specified trace is not shown in the Noise Temperature display.

1 indicates the specified trace is shown in the Noise Temperature display.

Examples

`TRAC1:NOIS:TEMP:SHOW` sets Trace 1 to show in the Noise Temperature display.

`TRAC2:NOIS:TEMP:SHOW?` might return `0`, indicating that Trace 2 is not showing in the Noise Temperature display.

TRACe<x>:NOISe:YFACtor:AVERage:COUNt

Sets or queries the average counts for the specified trace in the Y Factor display.

Conditions

Measurement view: Y Factor

The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:YFACtor:AVERage:COUNt <NR1>
TRACe<x>:NOISe:YFACtor:AVERage:COUNt?
```

Arguments

`<NR1> = integer`

Range: 2 to 10000

Returns

`<NR3>` floating point value with an exponent, which is the average count value.

Examples

`TRAC1:NOIS:TEMP:AVER:COUN?` might return `10.0000000000E+3`, indicating that the average count value is set to 10000.

TRACe<x>:NOISe:YFACtor:COUNt:ENABle

Sets or queries whether or not the count feature for the specified trace in the Y Factor display is enabled or disabled.

Conditions

Measurement view: Y Factor display The parameter <x>= 1 to 3.

Only available when trace Function is set to Avg (VRMS), Max Hold, or Min Hold.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:YFACtor:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:YFACtor:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the count feature for the specified trace.

`ON` or 1 enables the count feature for the specified trace.

Returns

0 indicates the count feature for the specified trace if disabled.

1 indicates the count feature for the specified trace if enabled.

Examples

`TRAC1:NOIS:YFAC:COUN:ENAB ON` enables the count feature for Trace 1.

`TRAC1:NOIS:YFAC:COUN:ENAB?` might return `0`, indicating that the count feature for Trace 1 is disabled.

TRACe<x>:NOISe:YFACtor:DETection

Sets or queries the trace detection method in the Y Factor display.

Conditions

Measurement view: Y Factor display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:YFACtor:DETection { AVERage }
TRACe<x>:NOISe:YFACtor:DETection?
```

Arguments

`AVERage`: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

Returns

`AVER` means that the trace function is set to Average (VRMS).

Examples

`TRACE1:NOIS:YFAC:DET AVER` sets the detection method for Trace 1 to Average (VRMS).

`TRACE2:NOIS:YFAC:DET?` might return `AVER`, indicating that the function for Trace 1 is set to Average (VRMS).

TRACe<x>:NOISE:YFACtor:FREeze

Specifies whether or not to freeze (halt updates of) the specified trace in the Y Factor display.

Conditions

Measurement view: Y Factor display The parameter <x>= 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISE:YFACtor:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:NOISE:YFACtor:FREeze?
```

Arguments

`OFF` or 0 normally updates the display of the specified trace.

`ON` or 1 stops updating the display of the specified trace.

Returns

0 indicates the specified trace is being updated normally in the Y Factor display.

1 indicates the specified trace is not being updated in the Y Factor display.

Examples

`TRAC1:NOIS:YFAC:FRE ON` freezes the display of Trace 1.

`TRAC1:NOIS:YFAC:FRE?` might return `0`, indicating that the display of Trace 1 is set to Freeze.

TRACe<x>:NOISe:YFACtor:FUNCtion

Sets or queries the trace processing method (function) in the Y Factor display.

Conditions

Measurement view: Y Factor display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:YFACtor:FUNCtion { NORMal | AVERage | MAXHold| MINHold}
TRACe<x:NOISe:YFACtor:FUNCtion?
```

Arguments

`NORMal`: Displays the trace record for each display point without additional processing.

`AVERage`: Each point on the trace is the result of determining the RMS Voltage value for all of the IQ samples available to the trace point. When displayed in either linear (Volts, Watts) or Log (dB, dBm), the correct RMS value results.

When the averaging function is applied to a trace, the averaging is performed on the linear (Voltage) values, resulting in the correct average for RMS values.

`MAXHold`: Displays the maximum value in the trace record for each display point.

`MINHold`: Displays the minimum value in the trace record for each display point.

Returns

`NORM` means that the trace function is set to Normal.

`AVER` means that the trace function is set to Average (VRMS).

`MAXH` means that the trace function is set to Max Hold.

`MINH` means that the trace function is set to Min Hold.

Examples

`TRAC1:NOIS:YFAC:FUNC NORM` sets the function for Trace 1 to Normal.

`TRAC2:NOIS:YFAC:FUNC?` might return `MAXH`, indicating that the function for Trace 1 is set to Max Hold.

TRACe<x>:NOISe:YFACtor:SELect

Sets the trace to be shown in the Y Factor display. The query form of this command returns whether or not the specified trace is set to show (ON) or not (OFF).

Conditions

Measurement view: Y Factor display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:YFACtor:SELect
TRACe<x>:NOISe:YFACtor:SELect?
```

Arguments

None

Returns

`0` means that the specified trace is not shown (set to Off).

`1` means that the specified trace is set to show (set to normal).

Examples

`TRAC1:NOIS:YFAC:SEL` will set the display to show Trace 1.

`TRAC2:NOIS:YFAC:SEL?` might return `1`, indicating that Trace 2 is set to show.

TRACe<x>:NOISe:YFACtor:SHOW

Sets or queries the state (shown or not shown) of the specified trace in the Y Factor display.

Conditions

Measurement view: Y Factor display The parameter <x> = 1 to 3.

Group

Trace commands

Syntax

```
TRACe<x>:NOISe:YFACtor:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:NOISe:YFACtor:SHOW?
```

Arguments

`OFF` or 0 hides the specified trace.

`ON` or 1 displays the specified trace.

Returns

0 indicates the specified trace is not shown in the Y Factor display.

1 indicates the specified trace is shown in the Y Factor display.

Examples

`TRACE1:NOISE:YFACTOR:SHOW` sets Trace 1 to show in the Y Factor display.

`TRACE2:NOISE:YFACTOR:SHOW?` might return `0`, indicating that Trace 2 is not showing in the Y Factor display.

TRACe<x>:OFDM:EVM

Determines whether or not to show the specified trace in the OFDM EVM view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:EVM { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:EVM?
```

Arguments

`OFF` or 0 hides the specified trace in the view.

`ON` or 1 shows the specified trace in the view.

Examples

`TRACe1:OFDM:EVM ON` shows Trace 1 in the OFDM EVM view.

TRACe<x>:OFDM:EVM:FREeze

Determines whether or not to freeze the display of the specified trace in the OFDM EVM view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:EVM:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:EVM:FREeze?
```

Arguments

OFF or 0 updates the display of the specified trace normally.

ON or 1 stops updating the display of the specified trace.

Examples

TRACE1:OFDM:EVM:FREEZE ON freezes the display for Trace 1.

TRACe<x>:OFDM:EVM:SELect

Sets or queries the specified trace to display in the OFDM EVM view. The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:EVM:SELect
TRACe<x>:OFDM:EVM:SELect?
```

Arguments

None

Returns

{ OFF | ON | 0 | 1 }

OFF or 0 indicates that the readout is not being displayed for the specified trace.

ON or 1 indicates that the readout is being displayed for the specified trace.

Examples

TRACE1:OFDM:EVM:SELECT selects Trace 1 (Average trace) to display the readout.

TRACE1:OFDM:EVM:SELECT? might return 1, indicating that the readout is being displayed for Trace 1.

TRACe<x>:OFDM:MERRor

Determines whether or not to show the specified trace in the OFDM Magnitude error view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:MERRor { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:MERRor?
```

Arguments

`OFF` or 0 hides the specified trace in the view.

`ON` or 1 shows the specified trace in the view.

Examples

`TRACe1:OFDM:MERRor ON` shows Trace 1 in the OFDM Magnitude error view.

TRACe<x>:OFDM:MERRor:FREeze

Determines whether or not to freeze the display of the specified trace in the OFDM Magnitude error view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:MERRor:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:MERRor:FREeze?
```

Arguments

`OFF` or 0 updates the display of the specified trace normally.

`ON` or 1 stops updating the display of the specified trace.

Examples

`TRACE1:OFDM:MERRor:FREEZE ON` freezes the display for Trace 1.

TRACe<x>:OFDM:MERRor:SELect

Sets or queries the specified trace to display in the OFDM Magnitude error view. The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:MERRor:SELect { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:MERRor:SELect?
```

Arguments

None

Returns

`{ OFF | ON | 0 | 1 }`

`OFF` or 0 indicates that the readout is not being displayed for the specified trace.

`ON` or 1 indicates that the readout is being displayed for the specified trace.

Examples

`TRACE1:OFDM:MERRor:SELECT` selects Trace 1 (Average trace) to display the readout.

`TRACE1:OFDM:MERRor:SELECT?` might return `1`, indicating that the readout is being displayed for Trace 1.

TRACe<x>:OFDM:PERRor

Determines whether or not to show the specified trace in the OFDM Phase error view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:PERRor { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:PERRor?
```

Arguments

`OFF` or 0 hides the specified trace in the view.

`ON` or 1 shows the specified trace in the view.

Examples

`TRACe1:OFDM:PERRor ON` shows Trace 1 in the OFDM Phase error view.

TRACe<x>:OFDM:PERRor:FREeze

Determines whether or not to freeze the display of the specified trace in the OFDM Phase error view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:PERRor:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:PERRor:FREeze?
```

Arguments

OFF or 0 updates the display of the specified trace normally.

ON or 1 stops updating the display of the specified trace.

Examples

TRACE1:OFDM:PERRor:FREEZE ON freezes the display for Trace 1.

TRACe<x>:OFDM:PERRor:SELect

Sets or queries the specified trace to display in the OFDM Phase error view. The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:PERRor:SELect { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:PERRor:SELect?
```

Arguments

None

Returns

{ OFF | ON | 0 | 1 }

OFF or 0 indicates that the readout is not being displayed for the specified trace.

ON or 1 indicates that the readout is being displayed for the specified trace.

Examples

TRACE1:OFDM:PERRor:SELECT selects Trace 1 (Average trace) to display the readout.

TRACE1:OFDM:PERRor:SELECT? might return 1, indicating that the readout is being displayed for Trace 1.

TRACe<x>:OFDM:POWer

Determines whether or not to show the specified trace in the OFDM Power view. The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:POWer { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:POWer?
```

Arguments

OFF or 0 hides the specified trace in the view.

ON or 1 shows the specified trace in the view.

Examples

TRACe1:OFDM:POWer ON shows Trace 1 in the OFDM Power view.

TRACe<x>:OFDM:POWer:FREeze

Determines whether or not to freeze the display of the specified trace in the OFDM Power view.

The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:POWer:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:POWer:FREeze?
```

Arguments

OFF or 0 updates the display of the specified trace normally.

ON or 1 stops updating the display of the specified trace.

Examples

TRACE1:OFDM:POWer:FREEZE ON freezes the display for Trace 1.

TRACe<x>:OFDM:POWer:SELect

Sets or queries the specified trace to display in the OFDM Power view. The parameter <x> = 1 or 2, where 1 is Average and 2 is Value.

Conditions

Measurement views: OFDM

Group

Trace commands

Syntax

```
TRACe<x>:OFDM:POWer:SELect { OFF | ON | 0 | 1 }
TRACe<x>:OFDM:POWer:SELect?
```

Arguments

None

Returns

{ OFF | ON | 0 | 1 }

OFF or 0 indicates that the readout is not being displayed for the specified trace.

ON or 1 indicates that the readout is being displayed for the specified trace.

Examples

TRACE1:OFDM:POWer:SELECT selects Trace 1 (Average trace) to display the readout.

TRACE1:OFDM:POWer:SELECT? might return 1, indicating that the readout is being displayed for Trace 1.

TRACe<x>:P25:CONStellation

Specifies whether or not to show the specified trace (Trace 1 or 2) in the P25 Constellation display.

Conditions

Measurement view: P25 Constellation display The parameter <x>= 1 or 2.

Group

Trace commands

Syntax

```
TRACe<x>:P25:CONStellation { OFF | ON | 0 | 1 }
TRACe<x>:P25:CONStellation?
```

Arguments

OFF or 0 hides the specified trace.

ON or 1 displays the specified trace.

Returns

0 indicates the specified trace is not shown in the P25 Constellation display.

1 indicates the specified trace is shown in the P25 Constellation display.

Examples

TRAC1:P25:CONS ON specifies that Trace 1 be shown in the P25 Constellation display.

TRACe<x>:P25:CONStellation:FREeze

Specifies whether or not to freeze (halt updates of) the specified trace (Trace 1 or 2) in the P25 Constellation display.

Conditions

Measurement view: P25 Constellation display The parameter <x>= 1 or 2.

Group

Trace commands

Syntax

```
TRACe<x>:P25:CONStellation:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:P25:CONStellation:FREeze?
```

Arguments

OFF or 0 normally updates the display of the specified trace.

ON or 1 stops updating the display of the specified trace.

Returns

0 indicates the specified trace is being updated normally in the P25 Constellation display.

1 indicates the specified trace is not being updated in the P25 Constellation display.

Examples

`TRAC1:P25:CONS:FRE ON` freezes the display of Trace 1.

`TRAC1:P25:CONS:FRE?` might return `0`, indicating that the display of Trace 1 is set to Freeze.

TRACe<x>:P25:CONStellation:MODE

Sets or queries how to display the trace content in the P25 Constellation display.

Conditions

Measurement view: P25 Constellation display The parameter <x>= 1 or 2.

Group

Trace commands

Syntax

```
TRACe<x>:P25:CONStellation:MODE { VECT | SYMB | LIN }
```

Arguments

`VECT` (vectors) connects adjacent symbol points with the signal locus.

`SYMB` (symbols) displays individual symbol points.

`LIN` (line) displays all symbol points as a line.

Returns

`VECT` adjacent symbol points are connected with the signal locus.

`SYMB` individual symbol points are displayed.

`LIN` all symbol points are displayed as a line.

Examples

`TRAC1:P25:CONS:MODE SYMB` sets the display to show the constellation of Trace 1 connecting adjacent symbol points with the signal locus.

TRACe<x>:P25:CONStellation:SELect

Selects the specified trace (Trace 1 or 2) in the P25 Constellation display.

Conditions

Measurement view: P25 Constellation display The parameter <x>= 1 or 2.

Group

Trace commands

Syntax

```
TRACe<x>:P25:CONStellation:SELect { OFF | ON | 0 | 1 }
TRACe<x>:P25:CONStellation:SELect?
```

Arguments

None

Returns

0 indicates the specified trace is not the active trace in the P25 Constellation display.

1 indicates the specified trace is the active trace in the P25 Constellation display.

Examples

`TRAC1:P25:CONS:SEL?` might return `1`, indicating that Trace 1 is the selected trace in the P25 Constellation display.

TRACe<x>:P25:EDIagram:ENABle:I

Determines whether to show or hide the I trace in the P25 Eye Diagram display.

Conditions

Measurement view: P25 Eye Diagram

Group

Trace commands

Syntax

```
TRACe<x>:P25:EDIagram:ENABle:I
TRACe<x>:P25:EDIagram:ENABle:I?
```

Related Commands

TRACe<x>:P25:EDIagram:ENABle:Q (on page 2733)

Arguments

`OFF` or 0 hides the I trace.

`ON` or 1 shows the I trace.

Returns

0 indicates the trace is off.

1 indicates the trace is on.

Examples

`TRACEX:P25:EDIAGRAM:ENABLE:I ON` shows the I trace in the P25 Eye Diagram display.

TRACe<x>:P25:EDIagram:ENABle:Q

Determines whether to show or hide the Q trace in the P25 Eye Diagram display.

Conditions

Measurement view: P25 Eye Diagram

Group

Trace commands

Syntax

```
TRACe<x>:P25:EDIagram:ENABle:Q
TRACe<x>:P25:EDIagram:ENABle:Q?
```

Related Commands

TRACe<x>:P25:EDIagram:ENABle:I (on page 2733)

Arguments

`OFF` or 0 hides the Q trace.

`ON` or 1 shows the Q trace.

Returns

0 indicates the trace is off.

1 indicates the trace is on.

Examples

`TRACEX:P25:EDIAGRAM:ENABLE:Q ON` shows the Q trace in the P25 Eye Diagram display.

TRACe<x>:P25:EDIagram:SELect:I

This command selects the I trace in the P25 Eye Diagram display. The query version of this command returns whether the I trace is selected or not.

Conditions

Measurement view: P25 Eye Diagram

Group

Trace commands

Syntax

```
TRACe<x>:P25:EDIagram:SELect:I
TRACe<x>:P25:EDIagram:SELect:I?
```

Related Commands

TRACe<x>:P25:EDIagram:SELect:Q (on page 2735)

Arguments

None.

Returns

`0` indicates that the I trace is not the selected trace.

`1` indicates that the I trace is the selected trace.

Examples

`TRACEX:P25:EDIAGRAM:SELECT:I` selects the I trace in the P25 Eye Diagram display.

TRACe<x>:P25:EDIagram:SELect:Q

This command selects the Q trace in the P25 Eye Diagram display. The query version of this command returns whether the Q trace is selected or not.

Conditions

Measurement view: P25 Eye Diagram

Group

Trace commands

Syntax

```
TRACe<x>:P25:EDIagram:SELect:Q
TRACe<x>:P25:EDIagram:SELect:Q?
```

Related Commands

TRACe<x>:P25:EDIagram:SELect:I (on page 2734)

Arguments

None.

Returns

0 indicates that the Q trace is not the selected trace.

1 indicates that the Q trace is the selected trace.

Examples

`TRACEX:P25:EDIAGRAM:SELECT:Q` selects the Q trace in the P25 Eye Diagram display.

TRACe<x>:PNOise:SELect

Selects the trace in the phase noise measurement. The query returns the currently selected trace.

The parameter <x> = 1 and 2.

Conditions

Measurement views: Phase noise

Group

Trace commands

Syntax

```
TRACe<x>:PNOise:SELect
TRACe<x>:PNOise:SELect?
```

Arguments

None

Returns

0 (not selected) or 1 (selected).

Examples

TRACE2:PNOISE:SELECT selects Trace 2.

TRACe<x>:PNOise:SHOW

Shows or hides the specified trace in the phase noise view. The parameter <x> = 1 and 2.

Conditions

Measurement views: Phase noise

Group

Trace commands

Syntax

```
TRACe<x>:PNOise:SHOW { OFF | ON | 0 | 1 }
TRACe<x>:PNOise:SHOW?
```

Arguments

OFF or 0 hides the specified trace.

ON or 1 shows the specified trace.

Examples

TRACE1:PNOISE:SHOW ON shows Trace 1 in the phase noise view.

TRACe<x>:PNOise:SMOothing:COUNt

Sets or queries the number of data points to take the moving average for smoothing the trace. This command is effective when TRACe<x>:PNOise:SMOothing:ENABle is set to ON.

The parameter <x> = 1 and 2.

Conditions

Measurement views: Phase noise

Group

Trace commands

Syntax

```
TRACe<x>:PNOise:SMOothing:COUNt <number>
TRACe<x>:PNOise:SMOothing:COUNt?
```

Arguments

<number>::<NR1> specifies the number of data points to take the moving average for smoothing. Range: 3 to 50.

Examples

TRACE1:PNOISE:SMOOTHING:COUNT 16 sets the smoothing count to 16 for Trace 1.

TRACe<x>:PNOise:SMOothing:ENABle

Determines whether to enable or disable smoothing the specified trace in the phase noise view.

The parameter <x> = 1 and 2.

Conditions

Measurement views: Phase noise

Group

Trace commands

Syntax

```
TRACe<x>:PNOise:SMOothing:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:PNOise:SMOothing:ENABle?
```

Arguments

`OFF` or 0 disables smoothing.

`ON` or 1 enables smoothing.

Examples

`TRACE1:PNOISE:SMOOTHING:ENABLE ON` enables smoothing Trace 1 in the phase noise view.

TRACe<x>:PNOise:SMOothing:RESet (No Query Form)

Restarts the smoothing process, discarding accumulated data and resetting the counter. This command is effective when `TRACe<x>:PNOise:SMOothing: ENABle` is set to ON.

The parameter <x> = 1 and 2.

Conditions

Measurement views: Phase noise

Group

Trace commands

Syntax

TRACe<x>:PNOise:SMOothing:RESet

Arguments

None

Examples

`TRACE1:PNOISE:SMOOTHING:RESET` restarts the smoothing process for Trace 1.

TRACe<x>:SPECtrum[:MEASview<y>]

Sets or queries the Reference level of measurement source for Q data type.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>] { OFF | ON | 0 | 1 }
TRACe<x>:SPECtrum[:MEASview<y>]?
```

Arguments

OFF or 0 hides the specified trace.

ON or 1 shows the specified trace.

For Trace 5 (spectrogram), use the TRACe:SGRam:SELect:LINE command to select the line to send to the spectrum display.

The parameter <x> = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE1:SPECTRUM:MEASview2 ON shows Trace 1 in the Spectrum Analyzer view.

TRACe<x>:SPECtrum[:MEASview<y>]:AVERage:COUNt

Sets or queries the number of traces to combine. This command is effective when TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion is AVERage, MAXHold or MINHold.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:AVERage:COUNt <number>
TRACe<x>:SPECtrum[:MEASview<y>]:AVERage:COUNt?
```

Arguments

<number>::<NR1> specifies the number of traces to combine for averaging.

Range: 1 to 10000.

The parameter <x> = 0 to 4. The specified marker must be activated using the CALCulate:MARKer:ADD command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

TRACE1:SPECTRUM:MEASVIEW2:AVERAGE:COUNT 64 sets the average count to 64 for Trace 1.

TRACe<x>:SPECtrum[:MEASview<y>]:AVERage:RESet (No Query Form)

Clears average data and counter, and restarts the average process for the specified trace in the Spectrum view. This command is effective when TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion is set to AVERage, MAXHold or MINHold.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

`TRACe<x>:SPECtrum[:MEASview<y>]:AVERage:RESet`

Arguments

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:AVERAGE:RESET` clears average data and counter, and restarts the average process for Trace 1.

TRACe<x>:SPECtrum[:MEASview<y>]:COLor:CURVe

Sets or queries how colors are mapped to the signal density in the Spectrum bitmap display. The mapping can be linear (Curve = 1), or it can be set to concentrate the resolution on the lower level of the range (Curve > 1) or the mapping can be set to show the best resolution on the upper range of density or hit count (Curve = 0.1 - 0.99). This command is only valid for the Bitmap display.

The parameter <x> = 6; only Trace 6 is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

`TRACe<x>:SPECtrum[:MEASview<y>]:COLor:CURVe <value>`

`TRACe<x>:SPECtrum[:MEASview<y>]:COLor:CURVe?`

Arguments

`<value>` = <NRf> specifies how colors are mapped to the signal density. Range: 0.1 to 10 (the default value is 2).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACe6:SPECTRUM:COLor:CURVe 1.5` concentrates the resolution on the lower level of the range on the Bitmap display.

TRACe<x>:SPECtrum[:MEASview<y>]:COLor:SCALe:AUTO (No Query Form)

Automatically adjusts the Max and Min color settings to display the broadest range of colors in the Spectrum bitmap display. This command is only valid for the Bitmap display.

The parameter <x> = 6; only Trace 6 is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

`TRACe<x>:SPECtrum[:MEASview<y>]:COLor:SCALe:AUTO`

Arguments

`<x>` = 6 specifies the auto-color setting for the Bitmap trace.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACe6:SPECTRUM:COLor:SCALe:AUTO` auto sets the Bitmap display color scheme.

TRACe<x>:SPECtrum[:MEASview<y>]:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for the Max or Min Hold trace in the Spectrum measurement. This command is effective when `TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold` and `INITiate:CONTinuous` is set to OFF.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:COUNt <number>
TRACe<x>:SPECtrum[:MEASview<y>]:COUNt?
```

Arguments

`<number>::<NR1>` specifies the count for Max/Min Hold.

Range: 1 to 10000.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:COUNT 32` sets the count to 32 for Trace 1.

TRACe<x>:SPECtrum[:MEASview<y>]:COUNt:ENABle

Determines whether to enable or disable the count for the Max or Min Hold trace in the Spectrum view. This command is effective when `TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold`.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:SPECtrum[:MEASview<y>]:COUNt:ENABle?
```

Arguments

`OFF` or 0 disables the count for the Max/Min Hold trace.

`ON` or 1 enables the count for the Max/Min Hold trace.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:COUNT:ENABLE ON` enables the Max/Min Hold count for Trace 1.

TRACe<x>:SPECtrum[:MEASview<y>]:COUNt:RESet (No Query Form)

Clears the Max or Min Hold data and counter, and restarts the process for the specified trace in the Spectrum view. This command is effective when `TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion` is set to `MAXHold` or `MINHold`.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:COUNt:RESet
```

Arguments

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:COUNT:RESET` clears the Max/Min Hold data and counter, and restarts the process for Trace 1.

TRACe<x>:SPECtrum[:MEASview<y>]:DETection

Sets or queries the display detector (method to be used for decimating traces to fit the available horizontal space on screen). The number of horizontal pixels on screen is generally smaller than that of waveform data points. When actually displayed, the waveform data is therefore thinned out, according to the number of pixels, for being compressed.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:DETection { AVERage | POSitive | NEGative| CAVerage | CPEak |
   QUASipeak | SAMPle | AVGLog }
TRACe<x>:SPECtrum[:MEASview<y>]:DETection?
```

Arguments

`AVERage` displays the average data value for each pixel.

`POSitive` displays the maximum data value for each pixel.

`NEGative` displays the minimum data value for each pixel.

`CAVerage` displays the CISPR average value for each pixel.

`CPEak` displays the CISPR peak value for each pixel.

`QUASipeak` displays the quasi-peak value for each pixel.

`SAMPle` displays the most recent sample value for each pixel.

`AVGLog` displays the average data value of logs for each pixel.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:DETECTION POSitive` displays the maximum data value for each pixel on Trace 1

TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent

Determines whether to enable or disable the dot persistence for the bitmap trace (Trace 6) in the Spectrum view.

The parameter <x> = 6; Only Trace 6 (bitmap trace) is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

`TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent { OFF | ON | 0 | 1 }`

`TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent?`

Arguments

`OFF` or `0` disables the dot persistence.

`ON` or `1` enables the dot persistence.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE6:SPECTRUM:DOT:PERSISTENT ON` enables the dot persistence in the Spectrum view.

TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:TYPE

Sets or queries the persistence type for the bitmap trace (Trace 6) in the Spectrum view.

The parameter <x> = 6; Only Trace 6 (bitmap trace) is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

`TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:TYPE { VARiable | INFinite }`

`TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:TYPE?`

Arguments

`VARiable`: Selects the variable persistence display which leaves acquired data points on the display for a period of time specified by the `TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:VARiable` command.

`INFinite`: Selects the infinite persistence display which accumulates data points on the display indefinitely.

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE6:SPECTRUM:DOT:PERSISTENT:TYPE VARiable` selects the variable persistence display.

TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:VARiable

Sets or queries how long data points are displayed. This command is effective when `TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:TYPE` is set to `VARiable`. This affects the display only.

The parameter <x> = 6; Only Trace 6 (bitmap trace) is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

`TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:VARiable <number>`

`TRACe<x>:SPECtrum[:MEASview<y>]:DOT:PERSistent:VARiable?`

Arguments

`<number>` = <NRf> specifies the how long waveform points are displayed on the screen. Range: 0 s to 1000 s (the default value is 10 ms).

The parameter <y> = 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE6:SPECTRUM:DOT:PERSISTENT:VARIABLE 20` specifies that the waveform points are displayed on the screen for a period of 20 before they disappear.

TRACe<x>:SPECtrum[:MEASview<y>]:FREeze

Determines whether or not to freeze the display of the specified trace in the Spectrum view.

The parameter <x> = 1 to 5; All traces are valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:SPECtrum[:MEASview<y>]:FREeze?
```

Arguments

`OFF` or 0 updates the display of the specified trace normally.

`ON` or 1 stops updating the display of the specified trace.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:FREEZE ON` freezes Trace 1 in the Spectrum Analysis display.

TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion

Sets or queries the function for the specified trace in the Spectrum view.

The parameter <x> = 1 to 3; Trace 4 (math trace) and Trace 5 (spectrogram) are invalid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion { NONE | AVERage | MAXHold | MINHold | AVGLog}
TRACe<x>:SPECtrum[:MEASview<y>]:FUNCtion?
```

Arguments

`NONE` selects the normal spectrum display.

`AVERage` selects the Average display that indicates the average signal level at each frequency point.

`MAXHold` selects the Max Hold display that indicates the maximum signal level at each frequency point.

`MINHold` selects the Min Hold display that indicates the minimum signal level at each frequency point.

`AVGLog` selects the Average of logs display that indicates the average signal level of logs at each frequency point.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE1:SPECTRUM:MEASVIEW2:FUNCTION MAXHold` selects Max Hold for Trace 1 in the Spectrum view.

TRACe<x>:SPECtrum[:MEASview<y>]:LEFToperand

Sets or queries the left operand for the math trace (Trace 4) in the Spectrum view. The parameter <x> = 4; Only Trace 4 (math trace) is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:LEFToperand { TRACE1 | TRACE2 | TRACE3 }
TRACe<x>:SPECtrum[:MEASview<y>]:LEFToperand?
```

Related Commands

TRACe<x>:SPECtrum[:MEASview<y>]:RIGHtoperand (on page 2746)

Arguments

`TRACE1` selects Trace 1 as the left operand for the math trace.

`TRACE2` selects Trace 2 as the left operand for the math trace.

`TRACE3` selects Trace 3 as the left operand for the math trace.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE4:SPECTRUM:MEASVIEW2:LEFTOPERAND TRACE1` selects Trace 1 as the left operand for the math trace.

TRACe<x>:SPECtrum[:MEASview<y>]:RIGHtoperand

Sets or queries the right operand for the math trace (Trace 4) in the Spectrum view. The parameter <x> = 4; Only Trace 4 (math trace) is valid.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:RIGHtoperand { TRACE1 | TRACE2 | TRACE3 }
TRACe<x>:SPECtrum[:MEASview<y>]:RIGHtoperand?
```

Related Commands

TRACe<x>:SPECtrum[:MEASview<y>]:LEFToperand (on page 2745)

Arguments

`TRACE1` selects Trace 1 as the right operand for the math trace.

`TRACE2` selects Trace 2 as the right operand for the math trace.

`TRACE3` selects Trace 3 as the right operand for the math trace.

The parameter <x> = 0 to 4. The specified marker must be activated using the `CALCulate:MARKer:ADD` command

The parameter <y>= 1 to 8 represents measurement index based on number of sources of connected instrument, where MEASview keyword is optional. By default y is 1.

Examples

`TRACE4:SPECTRUM:MEASVIEW2:RIGHTOPERAND TRACE1` selects Trace 1 as the right operand for the math trace

TRACe<x>:SPECtrum[:MEASview<y>]:SELect

Sets or queries the trace to display the readout at the upper left of the Spectrum view.

The parameter <x> = 1 to 5; All traces are valid.

NOTE: TRACe5 (spectrogram) is valid when the spectrum and spectrogram measurements are running.

Conditions

Measurement views: Spectrum

Group

Trace commands

Syntax

```
TRACe<x>:SPECtrum[:MEASview<y>]:SELect
TRACe<x>:SPECtrum[:MEASview<y>]:SELect?
```

Arguments

None

Returns

{ 0 | 1 }

- 0 indicates that the readout is not being displayed for the specified trace.
- 1 indicates that the readout is being displayed for the specified trace.

Examples

`TRACE1:SPECTRUM:MEASview1:SELECT` selects Trace 1 to display the readout.

`TRACE1:SPECTRUM:MEASview1:SELECT?` might return `1`, indicating that the readout is being displayed for Trace 1.

TRACe<x>:TXGain

Sets or queries the display to show or hide the specified trace.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain { OFF | ON | 0 | 1 }
TRACe<x>:TXGain?
```

Arguments

`OFF` or 0 hides the specified trace.

`ON` or 1 shows the specified trace.

Returns

`OFF` or 0 means that the specified trace is hidden.

`ON` or 1 means that the specified trace is showing.

Examples

`TRACE1:TXGAIN 1` shows Trace 1.

TRACe<x>:TXGain:AVERage:COUNt

Sets or queries the number of traces averaged to generate the displayed trace. (Present only when Function is set to anything but Normal.)

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:AVERage:COUNt <number>
```

Arguments

`<number>::=<NR1>` specifies the number of traces to combine for averaging.

Range: 1 to 10000

Returns

`<NR1>` is an integer that is the number of traces to combine for averaging.

Examples

`TRACE1:TXGAIN:AVERAGE:COUNT 64` sets the average count to 64 for Trace 1.

TRACe<x>:TXGain:AVERage:RESet (No Query Form)

Clears/resets the average data and counter and restarts the averaging process.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Function must be is set to anything but Normal.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:AVERage:RESet
```

Arguments

None.

Examples

`TRACE1:TXGAIN:AVERAGE:RESET` clears average data and counter, and restarts the average process for Trace 1.

TRACe<x>:TXGain:COUNt

Sets or queries how many acquisitions run in the single acquisition mode for the Average or Max or Min Hold trace in the measurement.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Function must be is set to anything but Normal.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:COUNt <number>
TRACe<x>:TXGain:COUNt?
```

Arguments

<number>::=<NR1> specifies the count for Averaged, Max or Min Hold.

Range: 1 to 10000.

Returns

<NR1> is an integer that is the count for Averaged, Max or Min Hold.

Examples

TRACE1:TXGAIN:COUNT 32 sets the count to 32 for Trace 1.

TRACe<x>:TXGain:COUNt:ENABle

The command enables or disables whether to use the number of traces Averaged or Max Hold or Min Hold to generate the displayed trace. The query returns whether or not it is enabled.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:COUNt:ENABle { OFF | ON | 0 | 1 }
TRACe<x>:TXGain:COUNt:ENABle?
```

Arguments

OFF or 0 disables the count for the specified trace.

ON or 1 enables the count for the specified trace.

Returns

OFF or 0 means that the count for the specified trace is disabled.

ON or 1 means that the count for the specified trace is enabled.

Examples

TRACE1:TXGAIN:COUNT:ENABLE ON enables the count for Trace 1.

TRACe<x>:TXGain:COUNt:RESet (No Query Form)

Restarts the trace count when the function is Average, Max Hold, or Min Hold.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:COUNt:RESet
```

Arguments

None.

Examples

`TRACE1:TXGAIN:COUNT:RESET` clears the trace data and counter, and restarts the process for Trace 1.

TRACe<x>:TXGain:FREeze

Sets the trace as frozen or live. The query returns whether the trace is frozen or live.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:FREeze { OFF | ON | 0 | 1 }
TRACe<x>:TXGain:FREeze?
```

Arguments

`OFF` or 0 updates the display of the specified trace normally.

`ON` or 1 stops updating (freezes) the display of the specified trace.

Returns

`OFF` or 0 means that the specified trace is updating normally on the display.

`ON` or 1 means that the specified trace is not updating on the display.

Examples

`TRACE1:TXGAIN:COUNT:FREEZE ON` freezes Trace 1 in the display.

TRACe<x>:TXGain:FUNCtion

Sets or queries the trace processing method.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:FUNCtion { NORMal | MAXHold | MINHold | AVERage | AVGLog }
```

Arguments

`NORMal` selects the normal display.

`AVERage` selects the Average display that indicates the average signal level at each frequency point.

`MAXHold` selects the Max Hold display that indicates the maximum signal level at each frequency point.

`MINHold` selects the Min Hold display that indicates the minimum signal level at each frequency point.

`AVGLog` selects the Average of logs display that indicates the average signal level of logs at each frequency point.

Returns

See Arguments.

Examples

`TRACE1:TXGAIN:COUNT:FUNCTION MAXHold` selects Max Hold for Trace 1.

TRACe<x>:TXGain:SELect

Selects or queries the specified trace.

Conditions

Measurement view: Transmission Gain Where <x> is the trace and is 1, 2, or 3.

Group

Trace commands

Syntax

```
TRACe<x>:TXGain:SELect
TRACe<x>:TXGain:SELect?
```

Arguments

None.

Returns

The currently selected trace number.

Examples

`TRACE1:TXGAIN:SELECT` selects Trace 2.

`TRACE1:TXGAIN:SELECT?` might return `1`, indicating that Trace 1 is selected.

TRACe<x>:WLAN:AD:CONSte:RESUlt:CONTent:STATe

Sets or queries the state of the specified Result Contents (Preamble, Header, Data, Guard) of the specified trace.

Conditions

Measurement view: 802.11ad Constellation

Where the <x> trace variable is 1, 2 , 3, or 4

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:AD:CONSte:RESUlt:CONTent:STATe <boolean>,<arg>
TRACe<x>:WLAN:AD:CONSte:RESUlt:CONTent:STATe?
```

Arguments

<boolean> arguments

0 or OFF disables the specified trace.

1 or ON enables the specified trace.

<arg> result contents arguments.

The Result Contents arguments are:

- 1 is the Preamble
- 2 is the Header
- 3 is the Data
- 4 is the Guard (only applies to Single Carrier standard)

Returns

See Arguments

Examples

TRACe1:WLAN:AD:CONSte:RESUlt:CONTent:STATe 1, 1 enables the Preamble result contents for trace 1.

TRACe2:WLAN:AD:CONSte:RESUlt:CONTent:STATe? might return 0, 3, indicating the Data result contents for trace 2 are disabled.

TRACe<x>:WLAN:AY:CONSte:RESUlt:CONTent:STATe

Set or query the result contents to Preamble, Header, Data, and Guard for the 11ay Single Carrier standard.

Conditions

Measurement view: 802.11ay Analysis Constellation

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:AY:CONSte:RESUlt:CONTent:STATe { 0 | 1 }
TRACe<x>:WLAN:AY:CONSte:RESUlt:CONTent:STATe?
```

Arguments

<x> is 1,2,3,4

OFF or 0 disables the Preamble, Header, Data, and Guard result contents are disabled for the 11ay Single Carrier standard (for 4.32 GHz BW Header is not applicable) based on Trace <x> selection, where <x> is 1,2,3,4.

ON or 1 enables the Preamble, Header, Data, and Guard result contents are enabled for the 11ay Single Carrier standard (for 4.32 GHz BW Header is not applicable) based on Trace <x> selection, where <x> is 1,2,3,4.

Returns

OFF or 0 means that the Preamble, Header, Data, and Guard result contents are disabled for the 11ay Single Carrier standard (for 4.32 GHz BW Header is not applicable) based on Trace <x> selection, where <x> is 1,2,3,4.

ON or 1 means that the Preamble, Header, Data, and Guard result contents are enabled for the 11ay Single Carrier (for 4.32 GHz BW Header is not applicable) based on Trace <x> selection, where <x> is 1,2,3,4.

Examples

TRAC1:WLAN:AY:CONS:RESU:CONT:STAT ON enables the Preamble, Header, Data, and Guard result contents for the 11ay Single Carrier standard under the Trace 1 tab.

TRAC2:WLAN:AY:CONS:RESU:CONT:STAT? may return OFF, which means that the Preamble, Header, Data, and Guard result contents are disabled for the 11ay Single Carrier standard under the Trace 2 tab.

TRACe<x>:WLAN:CONSte

Turns the selected trace on or off in the constellation plot display, or queries the enabled status. < x> is accepted by the command but ignored as there is only a single WLAN constellation trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:CONSte { 0 | 1 | OFF | ON }
TRACe<x>:WLAN:CONSte?
```

Arguments

OFF or 0 turns off the constellation trace.

ON or 1 turns on the constellation trace

Returns

Returns the status of the selected trace as an integral value.

0 implies a disabled trace.

1 implies a enabled trace.

Examples

TRAC:WLAN:CONS 1 turns the constellation trace on in the plot display.

TRACe<x>:WLAN:CONSte:FREeze

When the freeze state is turned on, the selected trace stops updating in the constellation plot. <x> is accepted by the command but ignored as there is only a single WLAN constellation trace.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:CONSte:FREeze { 0 | 1 | OFF | ON }
TRACe<x>:WLAN:CONSte:FREeze?
```

Arguments

ON or 1 turns on the freeze state, causing the constellation trace to stop updating.

OFF or 0 turns off the freeze state.

Returns

Outputs the frozen status of the selected trace as an integral value. 1 indicates a frozen trace (stopped updating) and 0 a non-frozen trace.

Examples

TRAC:WLAN:CONS:FRE 1 freezes the constellation trace, causing it to stop updating.

TRACe<x>:WLAN:CRESponse:SELect

Sets or queries which WLAN Channel Response trace is the active trace.TRACe1 is Magnitude, TRACe2 is Phase.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:CRESponse:SELect
TRACe<x>:WLAN:CRESponse:SELect?
```

Arguments

None

Returns

Returns 1, which implies that the selected trace is the active trace.

Returns 0, which implies that the selected trace is not the active trace.

Examples

TRACE1:WLAN:CRES:SELECT specifies to select the magnitude trace.

TRACE1:WLAN:CRES:SELECT? might return 1, indicating that the magnitude trace is the active trace.

TRACe<x>:WLAN:EVM:FREeze

When the freeze state is turned on, the selected trace stops updating. TRACe1 is Averages. TRACe2 is Points.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:EVM:FREeze {0|1|OFF|ON}
```

TRACe<x>:WLAN:EVM:FREeze?

Arguments

ON or 1 turns on the freeze state, causing the selected trace to stop updating.

OFF or 0 turns off the freeze state.

Returns

Outputs the frozen status of the selected trace as an integral value. 1 indicates a frozen trace and 0 a non-frozen trace.

Examples

TRACE2:WLAN:EVM:FREEZE 1 causes Trace 2 to stop updating.

TRACE2:WLAN:EVM:FREEZE 1? might return 0, indicating that Trace 2 is not in a freeze state and is updating.

TRACe<x>:WLAN:EVM[:SHOW]

Displays or hides the selected trace. TRACe1 is Averages.TRACe2 is Points.

NOTE: Use this command only with multicarrier standards and not singlecarrier (802.11b).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:EVM[:SHOW] { 0 | 1 | OFF | ON}
TRACe<x>:WLAN:EVM[:SHOW]?
```

Arguments

ON or 1 displays the trace.

OFF or 0 hides the trace.

Examples

TRAC2:WLAN:EVM:SHOW 1 displays the WLAN EVM points trace.

TRACe<x>:WLAN:MERRor:FREeze

When the freeze state is turned on, the selected trace stops updating. TRACe1 is Averages. TRACe2 is Points.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:MERRor:FREeze { 0 | 1 | OFF | ON }
TRACe<x>:WLAN:MERRor:FREeze?
```

Arguments

`ON` or 1 turns on the freeze state, causing the selected trace to stop updating.

`OFF` or 0 turns off the freeze state.

Returns

Outputs the frozen status of the selected trace as an integral value. 1 indicates a frozen trace and 0 a non-frozen trace.

Examples

`TRACE2:WLAN:MERR:FREEZE 1` causes Trace 2 to stop updating.

`TRACE2:WLAN:MERR:FREEZE 1?` might return `0`, indicating that Trace 2 is not in a freeze state and is updating.

TRACe<x>:WLAN:MERRor[:SHOW]

Displays or hides the selected trace. TRACe1 is Averages. TRACe2 is Points.

NOTE: Use this command only with multicarrier standards and not singlecarrier (802.11b).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:MERRor[:SHOW] { 0 | 1 | OFF | ON }
TRACe<x>:WLAN:MERRor[:SHOW]?
```

Arguments

`ON` or 1 displays the trace.

`OFF` or 0 hides the trace.

Examples

`TRAC2:WLAN:MERR:SHOW 1` displays the WLAN Magnitude Error points trace.

TRACe<x>:WLAN:PERRor:FREeze

When the freeze state is turned on, the selected trace stops updating. TRACe1 is Averages. TRACe2 is Points.

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:PERRor:FREeze { 0 | 1 | OFF | ON }
TRACe<x>:WLAN:PERRor:FREeze?
```

Arguments

`ON` or 1 turns on the freeze state, causing the selected trace to stop updating.

`OFF` or 0 turns off the freeze state.

Returns

Outputs the frozen status of the selected trace as an integral value. 1 indicates a frozen trace and 0 indicates a non-frozen trace.

Examples

`TRACE2:WLAN:PERR:FREEZE 1` causes Trace 2 to stop updating.

`TRACE2:WLAN:PERR:FREEZE 1?` might return `0`, indicating that Trace 2 is not in a freeze state and is updating.

TRACe<x>:WLAN:PERRor[:SHOW]

Displays or hides the selected trace. TRACe1 is Averages. TRACe2 is Points.

NOTE: Use this command only with multicarrier standards and not singlecarrier (802.11b).

Conditions

Measurement view: WLAN

This command requires WLAN Measurements

Group

Trace commands

Syntax

```
TRACe<x>:WLAN:PERRor[:SHOW] { 0 | 1 | OFF | ON }
TRACe<x>:WLAN:PERRor[:SHOW]?
```

Arguments

`ON` or 1 displays the trace.

`OFF` or 0 hides the trace.

Examples

`TRAC2:WLAN:PERR:SHOW 1` displays the WLAN Phase Error points trace.

Trigger commands

*TRG (No Query Form)

Generates a trigger. It produces the same effect as the Force Trigger button on the Trigger control panel. This command is valid when the trigger mode is Triggered.

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

`*TRG`

Arguments

None

Examples

`*TRG` generates a trigger.

TRIGger:ADVanced:SWEep:MODE

Sets or enables the analyzer to wait for a trigger for each acquisition in a swept spectrum or other measurement requiring multiple acquisitions worth of span.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

```
Syntax
TRIGger:ADVanced:SWEep:MODE {OFF|ON|0|1}
```

Arguments

`ON` or 1 enables the wait for a trigger for each acquisition.

`OFF` or 0 disables the wait for a trigger for each acquisition.

Returns

Examples

`TRIGGER:ADVANCED:SWEEP:MODE 1` causes the analyzer to wait for a trigger for each acquisition.

TRIGger:DPX:SHOW:FRAMes

Determines when to show frames in the swept acquisition mode. Show frames continuously when ON or show only triggered frames when OFF.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger:DPX:SHOW:FRAMes { OFF | ON | 0 | 1 }
TRIGger:DPX:SHOW:FRAMes?
```

Arguments

`OFF` or 0 shows only triggered frames.

`ON` or 1 shows frames continuously.

Examples

`TRIGger:DPX:SHOW:FRAMes ON` shows frames continuously.

TRIGger:DPX:TDM:SHOW:ALL

Sets or queries the selections of the DPX Prefs control panel tab page.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger:DPX:TDM:SHOW:ALL { OFF | ON | 0 | 1 }
TRIGger:DPX:TDM:SHOW:ALL?
```

Arguments

`OFF` or 0 selects the Synch with acquisition triggers option.

`ON` or 1 selects the Trigger as fast as possible option.

Examples

`TRIGGER:DPX:TDM:SHOW:ALL ON` selects the Trigger as fast as possible option in the DPX Prefs control panel tab.

TRIGger:EVENt:EXTernal:SLOPe

Sets or queries the signal slope of the External input to determine a trigger event.

Conditions

Requires an RSA 306, 306B, 500A series, or 600A series be connected.

Group

Trigger commands

Syntax

```
TRIGger:EVENt:EXTernal:SLOPe { RISE | FALL }
```

Arguments

`RISE` Trigger event occurs on the rising edge.

`FALL` Trigger event occurs on the falling edge.

Examples

`TRIGGER:EVENT:EXTERNAL:SLOPE RISE` sets the trigger event to occur on the rising edge of the External signal input.

TRIGger:EVENt:INPut:LEVel

Sets or queries the power level that the signal must pass through to cause a trigger event when the trigger type is set to Power.

Conditions

Requires an RSA 306, 306B, 500A series, or 600A series be connected.

Group

Trigger commands

Syntax

`TRIGger:EVENt:INPut:LEVel <numeric>`

Arguments

`<numeric>::=<NR3>`

Range: –170 dBm to 50 dBm

Examples

`TRIGGER:EVENT:INPUT:LEVEL 10` sets the trigger threshold level to 10 dBm.

TRIGger:EVENt:INPut:SLOPe

Sets or queries the signal slope of the RF Input to determine a trigger event.

Conditions

Requires an RSA 306, 306B, 500A series, or 600A series be connected.

Group

Trigger commands

Syntax

`TRIGger:EVENt:INPut:SLOPe { RISE | FALL }`

Arguments

`RISE` Trigger event occurs on the rising edge.

`FALL` Trigger event occurs on the falling edge.

Examples

`TRIGGER:EVENT:INPUT:SLOPE RISE` sets the trigger event to occur on the rising edge of the RF Input signal.

TRIGger:EVENt:INPut:TYPE

Sets or queries the type of trigger. (Power is the only available setting.)

Conditions

Requires an RSA 306, 306B, 500A series, or 600A series be connected.

Group

Trigger commands

Syntax

`TRIGger:EVENt:INPut:TYPE {POWer}`

Arguments

`POWer` Sets trigger type to Power.

Examples

`TRIGGER:EVENT:INPUT:TYPE POWER` sets the trigger type to Power.

TRIGger:EVENt:SOURce

Sets or queries the source of the signal to be monitored for a trigger event.

Conditions

Requires an RSA 306, 306B, 500A series, or 600A series be connected.

Group

Trigger commands

Syntax

```
TRIGger:EVENt:SOURce { INPut | EXTernal }
TRIGger:EVENt:SOURce?
```

Arguments

`INPut` Sets the trigger source to the RF Input.

`EXTernal` Sets the trigger source to use the External input.

Examples

`TRIGGER:EVENT:SOURCE INPUT` sets the trigger source to the RF Input.

TRIGger:MASK:NEW (No Query Form)

Loads a new frequency mask.

Conditions

Measurement views: All

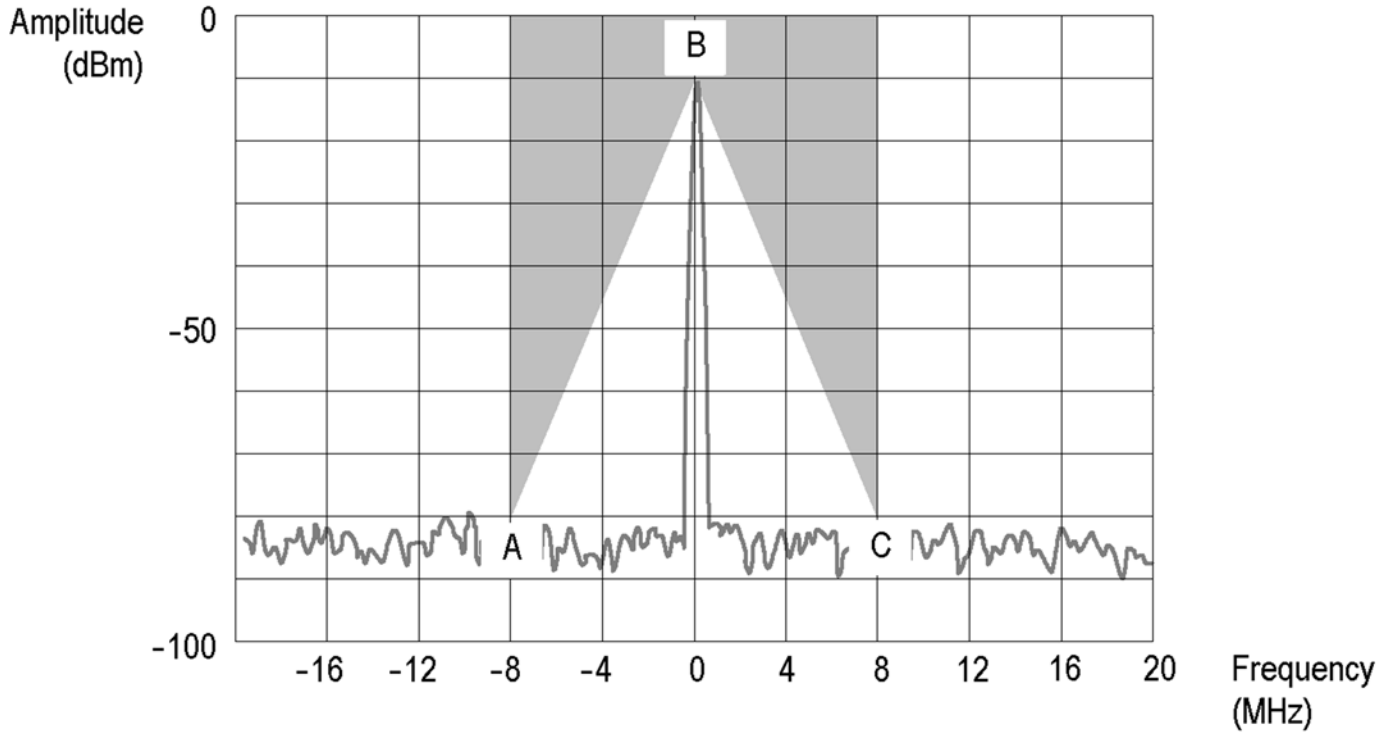
Group

Trigger commands

Syntax

`TRIGger:MASK:NEW <freq(1)>,<ampl(1)>,<freq(2)>,<ampl(2)>,...,<freq(n)>,<ampl(n)>(n = 500 maximum)`

Arguments



<freq(n)>,<ampl(n)> are numbers that represent a frequency (Hz) and amplitude (dBm) pair that define a point of the mask. Up to 500 pairs can be specified with zero frequency being the center screen. The mask is visible in the spectrum view with the following trigger conditions

NOTE: Do not include a unit suffix (such as Hz, dBm, or dB) with the arguments for this command.

- Trigger mode: Triggered (TRIGger[:SEQuence]:TIME:QUALified:TIME<x> is set to ON or 1.)
- Trigger type: Frequency Mask (TRIGger[:SEQuence]:EVENt:INPut:TYPE is set to FMASK.)

Examples

TRIGGER:MASK:NEW-8E6,-80,0,-10,8E6,-80 loads the mask with the points A (-8 MHz, -80 dBm), B (0 Hz, -10 dBm), and C (8 MHz, -80 dBm), as shown in the following figure.

Trigger mask setting example

TRIGger:MASK:NEW:AUTO (No Query Form)

Draws a new frequency mask automatically based on a reference trace.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

TRIGger:MASK:NEW:AUTO <meas_ID>,<trace_ID>,<x_margin>,<y_margin>

Arguments

<meas_ID>::<string> specifies the measurement view.

<trace_ID> specifies the reference trace.

The values of <meas_ID> and <trace_ID> are listed in the following table for each possible measurement view.

<x_margin>::<NRf> specifies the X margin (horizontal offset from the reference trace) in Hz.

<y_margin>::<NRf> specifies the Y margin (vertical offset from the reference trace) in dB.

Measurement view	<meas_ID>	<trace_ID>
Spectrum	"specan"	TRACE1 (Trace 1), TRACE2 (Trace 2), TRACE3 (Trace 3), TRACE4 (Math trace), TRACE5 (Spectrogram trace)
DPX, Spectrum	"dpx"	TRACE1 (+Peak trace), TRACE2 (-Peak trace), TRACE3 (Avg trace), TRACE4 (Math trace)q
GFFFGChannel power and ACPR	"acpr"	TRACE1 (Trace 1)
MCPR	"mcpr"	TRACE1 (Trace 1)
OBW	Q"obw"	TRACE1 (Trace 1)

Examples

TRIGGER:MASK:NEW:AUTO "specan",TRACE 1,2E+6,15 draws a new frequency mask automatically in the Spectrum view based on Trace 1 with the horizontal margin of 2 MHz and the vertical margin of 15 dB.

TRIGger:MASK:OPEN (No Query Form)

Opens a trigger mask with a specified file. To save a trigger mask, use the TRIGger:MASK:SAVE command.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

TRIGger:MASK:OPEN <file_name>

Arguments

<file_name>::<string> specifies the trigger mask file to open.

The file extension is .msk. You can omit the extension.

For the directory of file, refer to Specifying the File (on page 245).

Examples

TRIGGER:MASK:OPEN "C:\My Documents\Mask1" opens the trigger mask with the *Mask1* file in the *My Documents* directory.

TRIGger:MASK:SAVE (No Query Form)

Saves the current trigger mask to a specified file. To open the trigger mask, use the `TRIGger:MASK:OPEN` command.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger:MASK:SAVE <file_name>
```

Arguments

`<file_name>::<string>` specifies the file to save the trigger mask.

The file extension is .msk. You can omit the extension.

For the directory of file, refer to Specifying the File (on page 245).

Examples

`TRIGGER:MASK:SAVE"C:\My Documents\Mask1"` saves the trigger mask to the *Mask1* file in the *My Documents* directory.

TRIGger:SAVE:COUNt:MAXimum

Sets or queries the number of times a Save on Trigger action stores a file. After this limit is reached, no more files are saved. The instrument will continue to run, but no additional files are saved when a trigger event occurs.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:SAVE:COUNt:MAXimum <numeric>
```

Arguments

`<numeric>::=<NR1>`

Range: 1 to 10000

Examples

`TRIGGER:SAVE:COUNT:MAXIMUM 100` sets the number of files saved to 100.

TRIGger:SAVE:COUNt[:STATe]

Sets or queries the Maximum total number of files feature. When enabled and the set limit is reached, no more files are saved. The instrument will continue to run, but no additional files are saved when a trigger event occurs.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:SAVE:COUNt[:STATe] { OFF | ON | 0 | 1 }
```

Arguments

`ON` or 1 enables the maximum number of saved files feature.

`OFF` or 0 disables the maximum number of saved files feature.

Examples

`TRIGGER:SAVE:COUNT[:STATE] 1` enables the maximum number of saved files feature.

TRIGger:SAVE:DATA:FORMat

Sets or queries the file format used when saving the acquisition data on a trigger event.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:SAVE:DATA:FORMat { TIQ | CSV | MAT }
```

Arguments

`TIQ`: Native format data file which may include multiple frames.

`CSV`: Comma-separated values format.

`MAT`: MATLAB format.

Examples

`TRIGGER:SAVE:DATA:FORMAT TIQ` saves the data file in native format.

TRIGger:SAVE:DATA[:STATe]

Sets or queries to save data when a trigger event occurs.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:SAVE:DATA[:STATe] { OFF | ON | 0 | 1 }
```

Arguments

`ON` or 1 enables the save on trigger function.

OFF or 0 disables the save on trigger function

Examples

TRIGGER:SAVE:DATA[:STATE] 1 enables the save on trigger function.

TRIGger:SAVE:PICTure:FORMat

Sets or queries the file format used when saving a picture of the display when a trigger event occurs.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

TRIGger:SAVE:PICTure:FORMat { PNG | JPG | BMP }

Arguments

PNG, JPG, BMP: picture formats available.

Examples

TRIGGER:SAVE:PICTURE:FORMAT PNG sets the picture format extension to .PNG.

TRIGger:SAVE:PICTure[:STATe]

Sets or queries the save picture on trigger setting. This enables saving a picture of the display when a trigger event occurs.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

TRIGger:SAVE:PICTure[:STATe] { OFF | ON | 0 | 1 }

Arguments

OFF or 0 enables saving a picture.

ON or 1 disables saving a picture.

Examples

TRIGGER:SAVE:PICTURE[:STATE] 1 enables saving a picture of the display when a trigger event occurs.

TRIGger[:SEQuence]:ADVanced:HOLDoff

Sets or queries the trigger holdoff time which prevents triggers until there have been no trigger events for at least the specified holdoff period.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:ADVanced:HOLDoff <value>
TRIGger[:SEQuence]:ADVanced:HOLDoff?
```

Arguments

`<value>::<NRf>` specifies the trigger holdoff time. Range: 20 ns to 10 s.

Examples

`TRIGger[:SEQuence]:ADVanced:HOLDoff 1.5us` sets the trigger holdoff time to 1.5 µs.

TRIGger[:SEQuence]:ADVanced:HOLDoff:ENABle

Enables or queries the status of the Advanced Trigger Holdoff function.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:ADVanced:HOLDoff:ENABle { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:ADVanced:HOLDoff:ENABle?
```

Arguments

`OFF` or 0 does not trigger based on the advanced trigger holdoff settings.

`ON` or 1 enables triggering based on the advanced trigger holdoff settings.

Examples

`TRIGger:ADVanced:HOLDoff:ENABle ON` enables triggering based on the advanced trigger holdoff settings.

TRIGger[:SEQuence]:ADVanced:SWEep:MODE

Determines whether or not to trigger each segment in the swept acquisition mode.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:ADVanced:SWEep:MODE { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:ADVanced:SWEep:MODE?
```

Arguments

OFF or 0 does not trigger each segment in the swept acquisition mode.

ON or 1 triggers each segment in the swept acquisition mode.

Examples

TRIGGER:SEQUENCE:ADVANCED:SWEEP:MODE ON triggers each segment in the swept acquisition mode.

TRIGger[:SEQuence]:ADVanced:SWEPt:SEGMent:ENABle

Determines whether or not to set the spectrum analyzer to wait for a trigger for each acquisition in a swept spectrum or other measurement requiring multiple acquisitions worth of span.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:ADVanced:SWEPt:SEGMent:ENABle { OFF | ON| 0 | 1 }
TRIGger[:SEQuence]:ADVanced:SWEPt:SEGMent:ENABle?
```

Arguments

OFF or 0 does not trigger each segment in the swept acquisition mode.

ON or 1 triggers each segment in the swept acquisition mode.

Examples

TRIGger[:SEQuence]:ADVanced:SWEPt:SEGMent:ENABle ON waits for a trigger for each acquisition in a swept spectrum or other measurement requiring multiple acquisitions worth of span.

TRIGger[:SEQuence]:EVENt:A:EDGE:COUPling

Sets or queries the choice of trigger coupling type.

Conditions

Measurement views: All

Arguments

For MSO/LPD, available arguments are {DC | HFREject | LFREject | NOISereject}.

For SX, available arguments are {DC | AC | HFREject | LFREject | NOISereject| RF}.

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:A:EDGE:COUPling {DC| AC | HFREject | LFREject | NOISereject| RF}
TRIGger[:SEQuence]:EVENt:A:EDGE:COUPling?
```

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:COUPling DC` sets the Trigger coupling type to DC.

TRIGger[:SEQuence]:EVENt:A:EDGE:HOLDoff:MODE

Sets or queries the trigger hold off mode.

Conditions

Measurement views: All

This command is applicable only for SX/MSO.

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:A:EDGE:HOLDoff:MODE {TIME | RANDom | AUTO}
:TRIGger[:SEQuence]:EVENt:A:EDGE:HOLDoff:MODE?
```

Examples

`:TRIGger:SEQuence:EVENt:A:EDGE:HOLDoff:MODE RANDom` sets Holdoff mode to Random.

TRIGger[:SEQuence]:EVENt:A:EDGE:HOLDoff:TIME

Sets or queries the time after triggering on an event, that the instrument waits before detecting the same trigger event to start the next acquisition.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:HOLDoff:TIME <value>
TRIGger[:SEQuence]:EVENt:A:EDGE:HOLDoff:TIME?
```

Range

{0 to 10} in seconds

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:HOLDoff:TIME 5` sets the hold off time to 5 seconds.

TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl

Sets or queries where the trigger point occurs for trigger source type.

Conditions

Measurement views: All

This cmd is applicable only for SX.

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl <value>
:TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl
```

Examples

`:TRIGger:SEQuence:EVENt:A:EDGE:LEVEl -0.316` sets the trigger point to -0.316.

TRIGger[:SEQuence]:EVENt:EXTFront:IMPedance

Sets or queries the impedance of the external trigger input on the front panel.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:EXTFront:IMPedance { OHM50 | OHM5K}
TRIGger[:SEQuence]:EVENt:EXTFront:IMPedance?
```

Arguments

`OHM50` selects 50 Ω impedance.

`OHM5K` selects 5 kΩ impedance.

Examples

`TRIGGER:SEQUENCE:EVENT:EXTFRONT:IMPEDANCE OHM 50` selects 50 Ω impedance for the external trigger input on the front panel.

TRIGger[:SEQuence]:EVENt:EXTFront:LEVel

Sets or queries the trigger level at the external trigger input on the front panel.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:EXTFront:LEVel <value>
TRIGger[:SEQuence]:EVENt:EXTFront:LEVel?
```

Arguments

`<value>::<NRf>` specifies the trigger level. Range: -2.5 to +2.5 V.

Examples

`TRIGGER:SEQUENCE:EVENT:EXTFRONT:LEVEL 1.5` sets the trigger level to 1.5 V at the external trigger input on the front panel.

TRIGger[:SEQuence]:EVENt:EXTFront:SLOPe

Sets or queries the trigger slope of the external trigger input on the front panel.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:EXTFront:SLOPe { RISe | FALL }
TRIGger[:SEQuence]:EVENt:EXTFront:SLOPe?
```

Arguments

`RISe` causes the trigger event on the rising edge.

`FALL` causes the trigger event on the falling edge.

Examples

`TRIGGER:SEQUENCE:EVENT:EXTFRONT:SLOPE RISe` causes the trigger event on the rising edge of the external input signal.

TRIGger[:SEQuence]:EVENt:EXTRear:SLOPe

Sets or queries the trigger slope of the external trigger input on the rear panel. The trigger level is fixed to the TTL threshold.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:EXTRear:SLOPe { RISe | FALL }
TRIGger[:SEQuence]:EVENt:EXTRear:SLOPe?
```

Arguments

`RISe` causes the trigger event on the rising edge.

`FALL` causes the trigger event on the falling edge.

Examples

`TRIGGER:SEQUENCE:EVENT:EXTREAR:SLOPE RISe` causes the trigger event on the rising edge of the external input signal.

TRIGger[:SEQuence]:EVENt:GATed

Sets or queries the positive or negative logic for the gated trigger input on the rear panel.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:GATed { HIGh | LOW }
TRIGger[:SEQuence]:EVENt:GATed?
```

Arguments

`HIGh` specifies that the gated trigger input is high active.

`LOW` specifies that the gated trigger input is low active.

Examples

`TRIGGER:SEQUENCE:EVENT:GATED HIGh` specifies that the gated trigger input is high active.

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude

Sets or queries the center vertical level for the density trigger region of the RF input DPX bitmap display.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude <value>
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude?
```

Related Commands

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude:TOLerance (on page 2772)

Arguments

`<value>::<NRf>` specifies the vertical center of the trigger region in dBm.

Range: 0 to 200 dBm.

Examples

`TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude 100dBm` sets the center level to 100 dBm for the density trigger region.

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude:TOLerance

Sets or queries the positive and negative extensions of the density trigger region from the center vertical level. The density trigger region is defined for the DPX bitmap display.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude:TOLerance <value>
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude:TOLerance?
```

Related Commands

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency:TOLerance (on page 2773)

Arguments

`<value>::<NRf>` specifies an absolute amplitude value for the positive and negative limits of the density trigger region in dBm. Range: within the defined measurement box.

Examples

`TRIGger[:SEQuence]:EVENt:INPut:DDENsity:AMPLitude:TOLerance 50` sets the positive limit 50 dBm above the amplitude level and the negative limit 50 dBm below the amplitude level.

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency

Sets or queries the center horizontal level for the density trigger region of the RF input DPX bitmap display.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency <value>
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency?
```

Arguments

`<value>::<NRf>` specifies the horizontal center of the trigger region. Range: within the defined measurement box.

Examples

`TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency 1.82GHz` sets the center horizontal level to 1.82 GHz for the density trigger region.

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency:TOLerance

Sets or queries the left and right extensions of the density trigger region from the center horizontal level. The density trigger region is defined for the DPX bitmap display.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency:TOLerance <value>
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency:TOLerance?
```

Arguments

`<value>::<NRf>` specifies an absolute frequency value for the left and right limits from the center frequency of the density trigger region. Range: within the defined measurement box.

Examples

`TRIGger[:SEQuence]:EVENt:INPut:DDENsity:FREQuency:TOLerance 0.2GHz` for a center frequency of 1.82 GHz, sets the left horizontal limit to 1.62 GHz and the right horizontal limit to 2.02 GHz for the density trigger region.

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:THReshold

Sets or queries the DPX Density threshold that defines a trigger event for the density trigger region of the DPX bitmap display. The DPX Density must be higher or lower (specified by the Density selection) than this value to define a trigger event.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:THReshold <value>
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:THReshold?
```

Related Commands

Arguments

`<value>::<NRf>` specifies the DPX Density threshold as a percentage (%).

Range: within the defined measurement box.

Examples

`TRIGger[:SEQuence]:EVENt:INPut:DDENsity:THReshold 2` sets the DPX Density threshold to 2 % for the density trigger.

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:VIOLation

Sets or queries whether a density value higher or lower than the THReshold value defines a trigger event for the density trigger region of the DPX bitmap display.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:VIOLation { HIGHer| LOWer }
TRIGger[:SEQuence]:EVENt:INPut:DDENsity:VIOLation?
```

Related Commands

TRIGger[:SEQuence]:EVENt:INPut:DDENsity:THReshold (on page 2774)

Arguments

`HIGHer` a DPX density value above the THReshold value defines the trigger event.

`LOWer` a DPX Density value below the THReshold value defines the trigger event.

Examples

`TRIGger:EVENt:INPut:DDENsity:VIOLation LOWER` sets the DPX Density violation to trigger when the probability of occurrence is lower than the threshold percentage.

TRIGger[:SEQuence]:EVENt:INPut:FEDGe:LEVel

Sets or queries the trigger level at the frequency edge input.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:LEVel <value>
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:LEVel?
```

Arguments

`<value>::<NRf>` specifies the trigger level.

Range: ± (Max AcqBW/2) Hz

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:FEDGE:LEVEL 1.5` sets the trigger level to 1.5 V at the frequency edge input.

TRIGger[:SEQuence]:EVENt:INPut:FEDGe:LEVel:ACTual? (Query Only)

Queries the actual length of the frequency edge input for the DPX measurement.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:LEVel:ACTual?
```

Arguments

None

Returns

<NRf> The actual length in Hz.

Examples

TRIGGER:SEQUENCE:EVENT:INPUT:FEDGE:LEVEL:ACTUAL? might return 10 Hz, indicating that the actual length is 10 Hz.

TRIGger[:SEQuence]:EVENt:INPut:FEDGe:SLOPe

Sets or queries the trigger slope of the frequency edge input.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:SLOPe { RISe | FALL }
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:SLOPe?
```

Arguments

RISe causes the trigger event on the rising edge.

FALL causes the trigger event on the falling edge.

Examples

TRIGGER:SEQUENCE:EVENT:INPUT:FEDGE:SLOPE RISE causes the trigger event on the rising edge of the frequency edge input.

TRIGger[:SEQuence]:EVENt:INPut:FEDGe:THReshold:LEVel

Set or queries the threshold level in the DPX measurement.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:THReshold:LEVel <value>
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:THReshold:LEVel?
```

Arguments

<value>::<NRf> specifies the threshold level.

Range: 50 dBm to –170 dBm

Examples

TRIGGER:SEQUENCE:EVENT:INPUT:FEDGE:THRESHOLD:LEVEL –25 sets the threshold level to –25 dBm.

TRIGger[:SEQuence]:EVENt:INPut:FEDGe:THReshold:STATe

Set or queries the threshold state in the DPX measurement.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:THReshold:STATe { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:EVENt:INPut:FEDGe:THReshold:STATe?
```

Arguments

OFF or 0 disables the threshold.

ON or 1 enables the threshold.

Examples

TRIGGER:SEQUENCE:EVENT:INPUT:TDBWIDTH:STATE OFF enables the threshold.

TRIGger[:SEQuence]:EVENt:INPut:FMASk:{BANDwidth|BWIDth}[:RESolution]

Sets or queries the Resolution Bandwidth value to be used in the spectrum view for the frequency mask trigger.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FMASk:{BANDwidth|BWIDth}[: RESolution] <value>
TRIGger[:SEQuence]:EVENt:INPut:FMASk:{BANDwidth|BWIDth}[:RESolution]?
```

Arguments

<value>::<NRf> specifies the resolution bandwidth for Frequency Mask triggering.

Examples

TRIGger[:SEQuence]:EVENt:INPut:FMASk:BANDwidth 300kHz sets the resolution bandwidth to 300 kHz.

TRIGger[:SEQuence]:EVENt:INPut:FMASk:BANDwidth|BWIDth[:RESolution]:ACTual? (Query Only)

Queries current setting for the Resolution Bandwidth value used in the spectrum view for the frequency mask trigger.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FMASk:BANDwidth|BWIDth[: RESolution]:ACTual?
```

Arguments

None.

Examples

`TRIGger:EVENt:INPut:FMASk:BWIDth:ACTUAL?` returns the resolution bandwidth value.

TRIGger[:SEQuence]:EVENt:INPut:FMASk:BANDwidth|BWIDth[:RESolution]:AUTO

Sets or queries whether to automatically set the Resolution Bandwidth value used in the spectrum view for the frequency mask trigger.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FMASk:BANDwidth|BWIDth[: RESolution]:AUTO { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:EVENt:INPut:FMASk:BANDwidth|BWIDth[: RESolution]:AUTO?
```

Arguments

`OFF` or `0` sets the resolution bandwidth manually with the command `TRIGger[:SEQuence]:EVENt:INPut:FMASk:{BANDwidth|BWIDth}[:RESolution]`.

`ON` or `1` sets the resolution bandwidth automatically.

Examples

`TRIGger:EVENt:INPut:FMASk:BWIDth:AUTO ON` sets the resolution bandwidth automatically.

TRIGger[:SEQuence]:EVENt:INPut:FMASk:VIOLation

Sets or queries when the analyzer triggers in the frequency mask trigger.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:FMASk:VIOLation { T | F | TF| FT | TFT | FTF }
TRIGger[:SEQuence]:EVENt:INPut:FMASk:VIOLation?
```

Arguments

The following table lists the arguments which represent the trigger violations.

Trigger violations

Violation	Description
T	Only one state is required to initiate a trigger event. The signal has at least one data point inside the mask. The trigger event occurs at the first point that appears inside the mask. A trigger event could occur on the first acquisition.
F	Only one state change is required to initiate a trigger event. The signal has at least one data point outside the mask. The trigger event occurs at the first point that appears outside the mask. A trigger event could occur on the first acquisition.
TF	Two states are required to initiate a trigger event. The signal must be inside the mask and then passes out of the mask. The trigger event occurs at the first transition where the signal passes out of the mask.
FT	Two states are required to initiate a trigger event. The signal must be outside the mask and then passes into the mask. The trigger event occurs at the first transition where the signal passes into the mask.
TFT	Three states are required to initiate a trigger event. The signal starts inside the mask and then passes out of the mask. Next, the signal must pass into the mask. The trigger event occurs at the second transition where the signal passes back into the mask.
FTF	Three states are required to initiate a trigger event. The signal starts outside the mask and then passes into the mask. Next, the signal must pass back outside the mask. The trigger event occurs at the second transition where the signal passes back out of the mask.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:FMASK:VIOLATION TF` specifies that the analyzer will trigger when the signal has crossed into the mask and then outside of the mask.

TRIGger[:SEQuence]:EVENt:INPut:LEVel

Sets or queries the trigger level for the RF input level trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:LEVel <value>
TRIGger[:SEQuence]:EVENt:INPut:LEVel?
```

Arguments

`<value>::<NRf>` specifies the trigger level. Range: -170 to +50 dBm.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:LEVEL -10` sets the trigger level to −10 dBm for the RF input level trigger.

TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULSe

Sets or queries the Runt trigger for a positive or negative going pulse.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULSe { POSitive | NEGative }
TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULSe?
```

Arguments

`POSitive` causes the trigger event on a positive runt pulse.

`NEGative` causes the trigger event on a negative runt pulse.

Examples

`TRIGger:EVENt:INPut:RUNT:PULSE POSitive` causes the trigger event on a positive pulse.

TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULse:HIGH:LEVel

Sets or queries the upper level (first threshold) to qualify a Runt trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULse:HIGH:LEVel <value>
TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULse:HIGH:LEVel?
```

Arguments

`<value>::<NRf>` sets the upper vertical level for a runt pulse in dBm.

Examples

`TRIGger:EVENt:INPut:RUNT:PULSE 300` causes the trigger event when the leading edge of a pulse crosses the 300 dBm level.

TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULSe:LOW:LEVel

Sets or queries the lower level (second threshold) to qualify a Runt trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULSe:LOW:LEVel <value>
TRIGger[:SEQuence]:EVENt:INPut:RUNT:PULSe:LOW:LEVel?
```

Arguments

`<value>::<NRf>` sets the lower vertical level for a runt pulse in dBm.

Examples

`TRIGger:EVENt:INPut:RUNT:PULSE 3` causes the trigger event when the following edge of a pulse crosses the 3 dBm level.

TRIGger[:SEQuence]:EVENt:INPut:SLOPe

Sets or queries the trigger slope for the RF input level trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:SLOPe { RISe | FALL }
TRIGger[:SEQuence]:EVENt:INPut:SLOPe?
```

Arguments

`RISe` causes the trigger event on the rising edge.

`FALL` causes the trigger event on the falling edge.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:SLOPE RISe` causes the trigger event on the rising edge of the RF input signal.

TRIGger[:SEQuence]:EVENt:INPut:TDBWidth

Sets or queries the time-domain bandwidth for the RF input power trigger. This command is effective when `TRIGger[:SEQuence]:EVENt:INPut:TDBWidth:STATe` is ON.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:TDBWidth <value>
TRIGger[:SEQuence]:EVENt:INPut:TDBWidth?
```

Arguments

`<value>::<NRf>` specifies the time-domain bandwidth.

Range: 1 Hz to 60 MHz.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:TDBWIDTH 5MHz` sets the time-domain bandwidth to 5 MHz for the RF input power trigger.

TRIGger[:SEQuence]:EVENt:INPut:TDBWidth:ACTual? (Query Only)

Queries the actual time-domain bandwidth for the RF input power trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:TDBWidth:ACTual?
```

Related Commands

TRIGger[:SEQuence]:EVENt:INPut:TDBWidth (on page 2781)

Arguments

None

Returns

`<NRf>` Actual time-domain bandwidth.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:TDBWIDTH:ACTUAL?` might return `1.000E+6`, indicating that the actual time-domain bandwidth is 1 MHz.

TRIGger[:SEQuence]:EVENt:INPut:TDBWidth:STATe

Determines whether to set the time-domain bandwidth automatically or manually for the RF input power trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:TDBWidth:STATe { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:EVENt:INPut:TDBWidth:STATe?
```

Arguments

`OFF` or `0` sets the time-domain bandwidth automatically.

`ON` or `1` sets the time-domain bandwidth manually using the `TRIGger[:SEQuence]: EVENt:INPut:TDBWidth` command.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:TDBWIDTH:STATE OFF` sets the time-domain bandwidth automatically.

TRIGger[:SEQuence]:EVENt:INPut:TYPE

Sets or queries the trigger type for the source of RF input.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:INPut:TYPE { POWer | FMASK | DDENsity | RUNT | FEDGe }
TRIGger[:SEQuence]:EVENt:INPut:TYPE?
```

Arguments

`POWer` uses the power level for triggering.

`FMASK` uses the frequency mask for triggering.

`DDENsity` uses the density mask for triggering.

`RUNT` uses the runt mask for triggering.

Examples

`TRIGGER:SEQUENCE:EVENT:INPUT:TYPE FMASK` uses the frequency mask for triggering.

:TRIGger[:SEQuence]:EVENt:PPS:SYStrigger

Queries the last triggered local system time when 1-PPS trigger is selected.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:PPS:SYStrigger?
```

Examples

`:TRIGger[:SEQuence]:EVENt:PPS:SYStrigger?` might return `15:02:12.000001`.

:TRIGger[:SEQuence]:EVENt:PPS:UTCtrigger

Queries the last triggered global UTC time when 1-PPS trigger is selected.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:PPS:UTCtrigger?
```

Examples

`:TRIGger[:SEQuence]:EVENt:PPS:UTCtrigger?` might return `09:32:12.000001`.

TRIGger[:SEQuence]:EVENt:SOURce

Sets or queries the trigger event source.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:SOURce { INPut | EXTFront | EXTRear| EXTGated | LINe }
TRIGger[:SEQuence]:EVENt:SOURce?
```

Arguments

The following table lists the arguments.

Trigger event source

Argument	Source
INPut	RF input
EXTFront	Trigger in (front)
EXTRear	Trigger in (rear)
EXTGated	Gate in
LINe	AC line

Argument	Source
PPST	PPS Event

Examples

`TRIGGER:SEQUENCE:EVENT:SOURCE INPut` specifies the trigger event source as the RF input.

TRIGger[:SEQuence]:FORCed

Determines whether or not to cause a manual trigger if the acquisition is armed, ready and waiting for a trigger. This command is valid when `TRIGger[:SEQuence]:TIME:QUALified:TIME<x>` is set to On (the trigger mode is Triggered).

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:FORCed { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:FORCed?
```

Arguments

`OFF` or `0` does not cause a manual trigger.

`ON` or `1` causes a manual trigger.

Examples

`TRIGGER:SEQUENCE:FORCED ON` causes a manual trigger if the acquisition is armed, ready and waiting for a trigger.

TRIGger:SEQuence:FORCed (No Query Form)

Causes a trigger event to occur when the trigger mode is set to Triggered, regardless of the set trigger conditions.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:SEQuence:FORCed
```

Arguments

None

Examples

`TRIGGER:SEQUENCE:FORCED` forces a trigger event.

TRIGger[:SEQuence]:IMMediate (No Query Form)

Causes a trigger immediately, skipping the event detection and delay. This command is valid when `TRIGger[:SEQuence]:TIME:QUALified:TIME<x>` is set to On (the trigger mode is Triggered).

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:IMMediate
```

Arguments

None

Examples

`TRIGGER:SEQUENCE:IMMEDIATE` causes a trigger immediately, skipping the event detection and delay.

TRIGger[:SEQuence]:STATus

Sets or queries the trigger mode (Free Run or Triggered).

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:STATus { OFF | ON | 0 | 1 }
TRIGger[:SEQuence]:STATus?
```

Arguments

`OFF` or `0` selects the free-run mode.

`ON` or `1` selects the triggered mode.

Examples

`TRIGGER:SEQUENCE:STATUS ON` selects the triggered mode.

TRIGger[:SEQuence][:STATus]

Sets or queries the trigger mode setting.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence][:STATus] { 0 | 1 }
TRIGger[:SEQuence][:STATus]?
```

Arguments

`0` sets the trigger mode to Free Run.

`1` sets the trigger mode to Triggered.

Examples

`TRIGGER:SEQUENCE:STATUS 0` sets the trigger mode to Free Run.

TRIGger[:SEQuence]:TIME:DELay

Sets or queries the trigger delay time which occurs after recognizing an event but before actually declaring the trigger.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:TIME:DELay <value>
TRIGger[:SEQuence]:TIME:DELay?
```

Arguments

`<value>::<NRf>` specifies the trigger delay time. Range: 0 to 60 s.

Examples

`TRIGGER:SEQUENCE:TIME:DELAY 1.5` sets the trigger delay time to 1.5 s.

TRIGger[:SEQuence]:TIME:POSition

Sets or queries the position of the trigger event within the acquisition record.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:TIME:POSition <value>
TRIGger[:SEQuence]:TIME:POSition?
```

Arguments

`<value>::<NRf>` specifies the trigger position. Range: 1% to 99%.

Examples

`TRIGGER:SEQUENCE:TIME:POSITION 20` sets the trigger position to 20% of the acquisition record.

TRIGger[:Sequence]:TIME:POSition:AUTO

Sets or queries the position of the trigger event (automatic or manual) within the acquisition record.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:Sequence]:TIME:POSition:AUTO { OFF | ON | 0 | 1 }
TRIGger[:Sequence]:TIME:POSition:AUTO?
```

Arguments

`OFF` or `0` sets the position of the trigger event manually.

`ON` or `1` sets the position of the trigger event automatically.

Examples

`TRIGGER:SEQUENCE:TIME:POSITION:AUTO ON` sets the position of the trigger event automatically.

TRIGger[:SEQuence]:TIME:QUALified

Sets or queries the timing qualification setting for triggers. Trigger events that do not meet the timing qualifications are ignored.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:TIME:QUALified { SHORter | LONGer | INSide | OUTSide | NONE }
TRIGger[:SEQuence]:TIME:QUALified?
```

Arguments

`SHORter` the length of the trigger event is shorter than the time specified by the `TRIGger:TIME:QUALified:TIME1` setting.

`LONGer` the length of the trigger event is longer than the time specified by the `TRIGger:TIME:QUALified:TIME1` setting.

`INSide` the length of the trigger event is longer than the time `TRIGger:TIME:QUALified:TIME1` setting and shorter than the `TRIGger:TIME:QUALified:TIME2` setting.

`OUTSide` the length of the trigger event is shorter than the time `TRIGger:TIME:QUALified:TIME1` setting or longer than the `TRIGger:QUALified:TIME2` setting.

Examples

`TRIGger:SEQuence:TIME:QUALified SHORter` the length of the trigger event is shorter than the time specified by the `TRIGger:TIME:DELAY` setting.

TRIGger[:SEQuence]:TIME:QUALified:TIME<x>

Sets or queries the Time1 and Time2 parameters for time qualified triggering. Time1 is the shorter or first time, and Time2 is the second or later time for the qualifying period. Each `TIME<x>` must be set with a separate command.

Conditions

Measurement views: All

For SignalVu-PC users, the RSA instrument must be connected.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:TIME:QUALified:TIME<x> <value>
```

Related Commands

TRIGger[:SEQuence]:TIME:QUALified (on page 2788)

Arguments

`<value>::<NRf>` the length of the trigger time for TIME1 or TIME2.

(Range for RSA5100B: 0 ns to 28 s.)

Examples

`TRIGger:TIME:QUALified:TIME1 55µs` sets the TIME1 trigger point at 55 µs after the trigger event.

TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:ANAlog

Sets or queries where the trigger point occurs for Analog Trigger Source Type.

Conditions

Measurement views : All

This cmd is applicable only for MSO/LPD

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:ANAlog <value>
TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:ANAlog?
```

Range

{-0.316 to 0.316} in volts

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:LEVEl:ANAlog -0.316` sets the trigger point to –0.316.

TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:FREQuency

Sets or queries where the trigger point occurs for FreqVsTime Trigger Source Type.

Conditions

Measurement views: All

This cmd is applicable only for MSO/LPD.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:FREQuency <value>
TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:FREQuency?
```

Range

{-32.5E+6 to 32.5E+6} in Hz

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:LEVEl:FREQuency?` queries the trigger point of Frequency vs Time Source type.

TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:MAGNitude

Sets or queries where the trigger point occurs for MagVsTime Trigger Source Type.

Conditions

Measurement views: All

This cmd is applicable only for MSO/LPD.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:MAGNitude <value>
TRIGger[:SEQuence]:EVENt:A:EDGE:LEVEl:MAGNitude?
```

Range

{0 to 0.32} in Vrms/dBm

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:LEVEl:MAGNitude 0.32` sets the trigger point of MagVsTime source type to 0.32.

TRIGger[:SEQuence]:EVENt:A:EDGE:SETTings

Sets or queries the setting of trigger source type.

Conditions

Measurement views: All

This cmd is applicable only for SX.

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:TYPE {SHARed|INDEpendent}
:TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:TYPE?
```

Arguments

`SHARed` specifies that all trigger settings will be shared among all trigger sources.

`INDEpendent` specifies that all trigger settings will be independent of trigger source.

Examples

`:TRIGger:SEQuence:EVENt:A:EDGE:SOURce SHARed` sets the source type settings to shared.

TRIGger[:SEQuence]:EVENt:A:EDGE:SLOPe

Sets or queries whether instrument finds the trigger point on rising or falling edge or either edge of a signal.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:SLOPe { RISE | FALL | EITHer}
TRIGger[:SEQuence]:EVENt:A:EDGE:SLOPe?
```

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:SLOPe RISE` sets the trigger point on Rise.

TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce

Sets or queries the channel on which signal is to be monitored for a trigger event.

Conditions

Measurement views: All

For MSO/LPD trigger source can be selected from the list of available channels (CH1 to CH8).

For SX trigger source can be selected from list of channels as well as AUX and LINE inputs if available.

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce {CH1 | CH2 | CH3 | CH4 | CH5 | CH6 | CH7 | CH8 | MCH1 |
   MCH2 | MCH3 | MCH4 | AUX | LINE}
:TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce?
```

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:SOURce CH1` sets CH1 on which trigger event to be monitored.

TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:FORMat

Sets or queries the vertical scale mode to Amplitude (Vrms) or Power (log).

Conditions

Measurement views: All

This cmd is applicable only for MSO/LPD.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:FORMat { AMPLINear| POWLINear | POWLOG}
TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:FORMat?
```

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:SOURce:FORMat AMPLINear` sets vertical scale mode to Amplitude.

TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:TYPE

Sets or queries the choice of Trigger source type.

Conditions

Measurement views: All

This cmd is applicable only for MSO/LPD.

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:TYPE { ANALog | MAGVstime | FREQvstime }
TRIGger[:SEQuence]:EVENt:A:EDGE:SOURce:TYPE?
```

Examples

`TRIGger:SEQuence:EVENt:A:EDGE:SOURce ANALog` sets the source type to Analog.

TRIGger[:SEQuence]:EVENt:A:TYPE

Sets or queries the trigger type { supporting only Edge trigger}.

Conditions

Measurement views: All

Group

Trigger commands

Syntax

```
TRIGger[:SEQuence:]EVENt:A:TYPE { EDGE }
TRIGger[:SEQuence:]EVENt:A:TYPE?
```

Examples

`TRIGger:SEQuence:EVENt:A:TYPE EDGE` sets trigger type to edge.

TRIGger[:SEQuence]:MODE

Sets or queries the trigger mode setting.

Conditions

This cmd is applicable only for SX.

Group

Trigger commands

Syntax

```
:TRIGger[:SEQuence]:MODE {0 | 1}
:TRIGger[:SEQuence]:MODE?
```

Examples

`:TRIGger:SEQuence:MODE 0` sets the trigger mode to Free Run.

TRIGger:TIME:POSition

Sets or queries the point (in percent) along the acquisition record the trigger event should occur. Manually setting the trigger position disables the Auto setting.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:TIME:POSition <numeric>
```

Arguments

`<numeric>::=<NR1>`

Range: 1 to 100

Examples

`TRIGGER:TIME:POSITION 50` sets the acquisition point to 50%.

TRIGger:TIME:POSition:AUTO

Sets or queries the instrument to automatically set the position of the trigger event.

Conditions

Requires an RSA be connected with SignalVu-PC.

Group

Trigger commands

Syntax

```
TRIGger:TIME:POSition:AUTO { OFF | ON | 0 | 1 }
```

Arguments

`ON` or `1` enables auto trigger position.

`OFF` or `0` disables auto trigger position.

Examples

`TRIGGER:TIME:POSITION:AUTO 1` enables the auto trigger position setting.

UNIT:POWer

Sets or queries the fundamental unit of power. This command is equivalent to `[SENSe]:POWer:UNITs`.

Conditions

Measurement views: All

Group

Unit commands

Syntax

```
UNIT:POWer { DBM | DBV | VOLTs | WATTs | DBUW | DBW| DBUV |DBMV | DBUA | DBUV_M | DBUA_M |
    AMPS }UNIT:POWer?
```

Arguments

The following table lists the arguments.

Power units

Argument	Power unit
DBM	dBm
DBV	dBV
VOLTs	Volts
WATTs	Watts
DBUW	dBµW
DBW	dBW
DBUV	dBµV
DBMV	dBmV
DBUA	dBµA
DBUV_M	dBµV/m

Argument	Power unit
DBUA_M	dBµA/m
AMPS	Amps

NOTE: Select dBµV/m or dBµA/m unit when using an antenna table.

Examples

`UNIT:POWERDBM` specifies the fundamental unit of power as dBm.

*WAI (No Query Form)

Prevents the analyzer from executing further commands or queries until all pending operations finish. This command allows you to synchronize the operation of the analyzer with your application program. For the details, refer to Synchronizing execution (on page 2804).

Conditions

Measurement views: All

Group

IEEE common commands

Syntax

`*WAI`

Related Commands

*OPC (on page 1594)

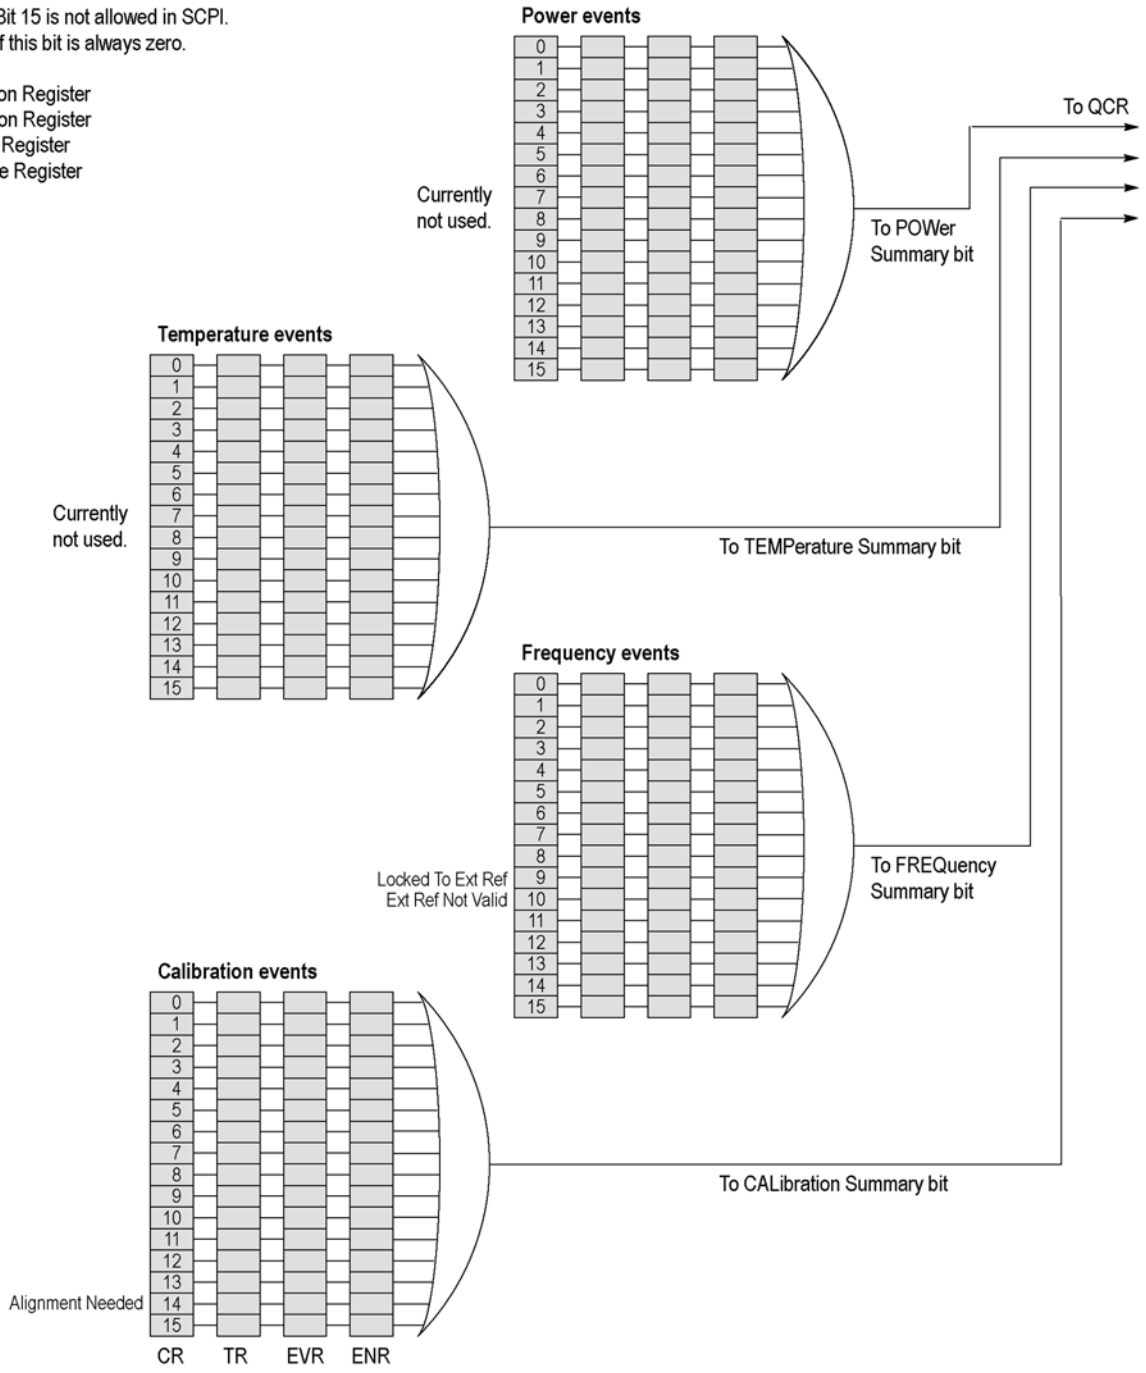
Arguments

None

Status and Events

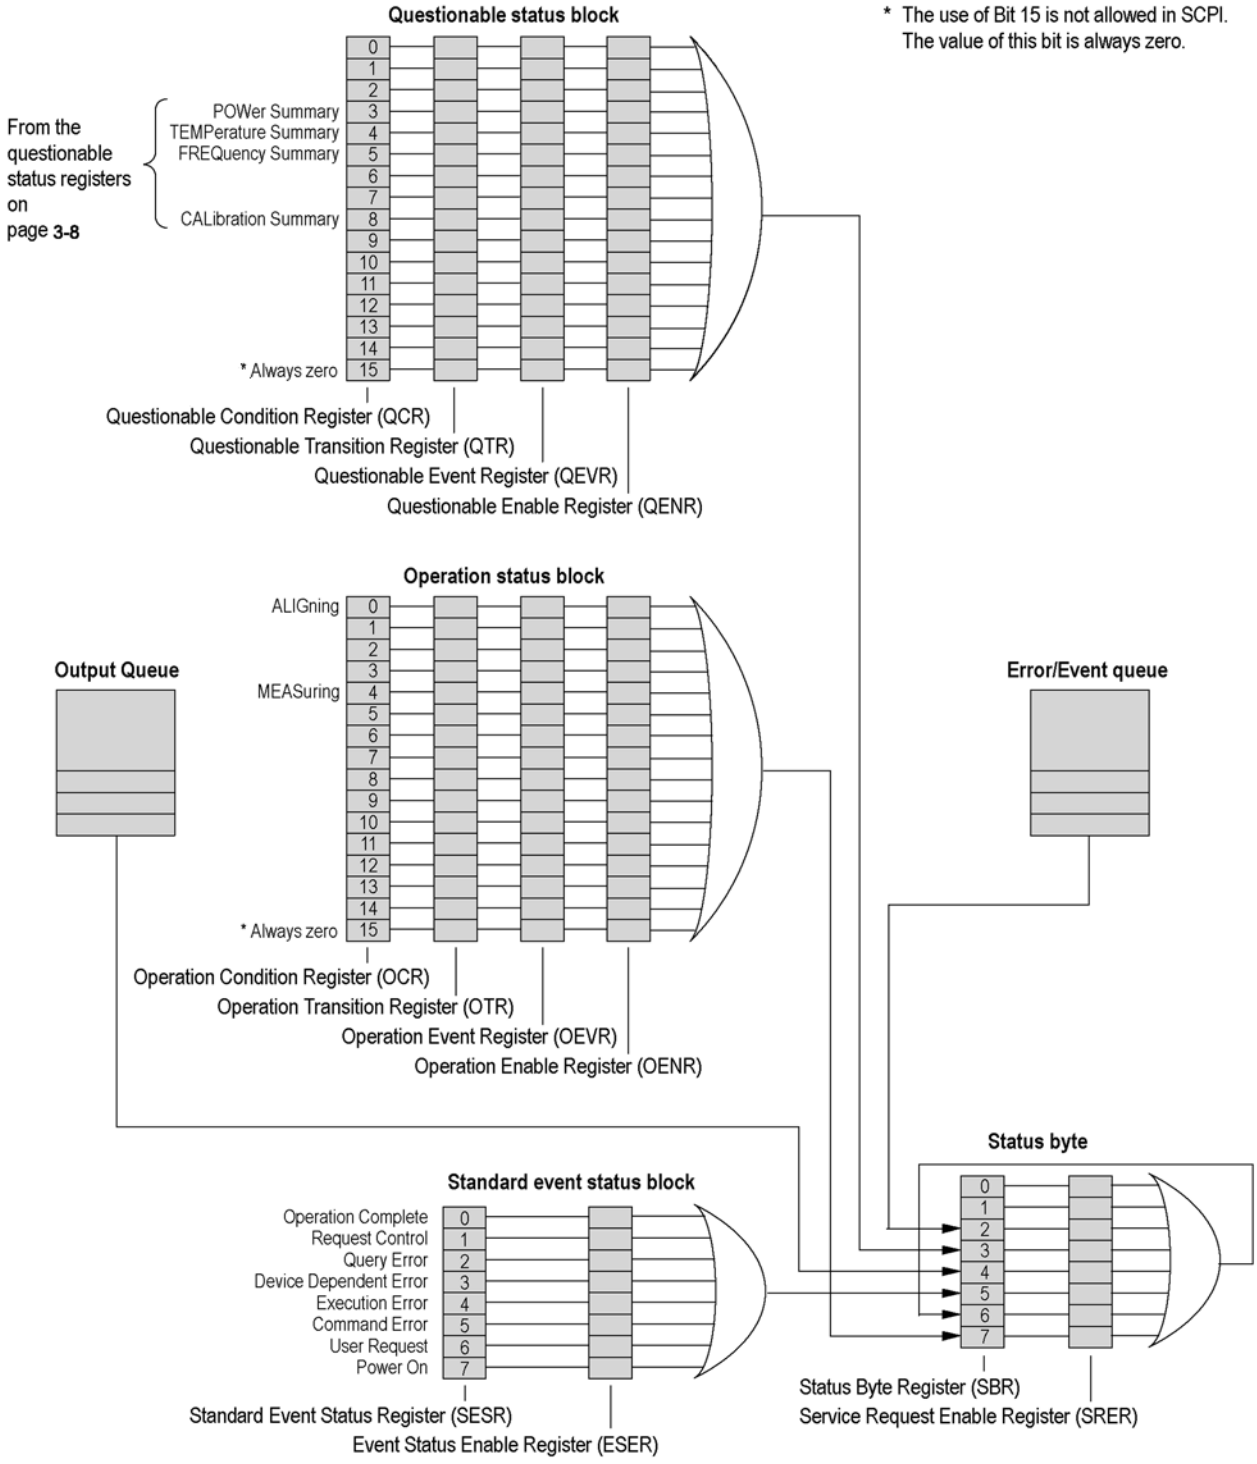
The SCPI interface in the analyzer includes a status and event reporting system that enables the user to monitor crucial events that occur in the instrument. The analyzer is equipped with four registers and one queue that conform to IEEE Std 488.2-1987. This section will discuss these registers and queues along with status and event processing.

Status and event reporting system



The following figure outlines the status and event reporting mechanism offered in the RSA Series analyzers. It contains three major blocks

- Standard Event Status
- Operation Status
- Questionable Status (fan-out structure)



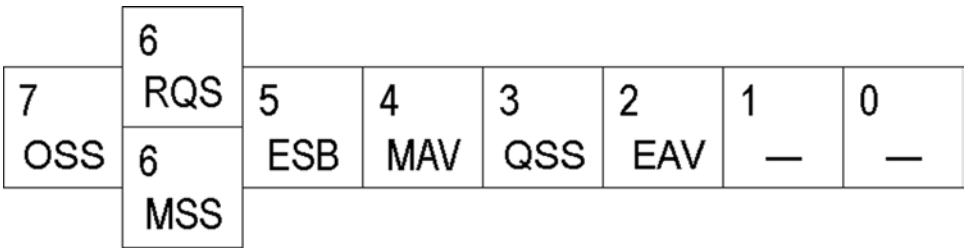
The processes performed in these blocks are summarized in the Status Byte. The three blocks contain four types of registers as shown in the following table.

Register type

Register	Description
Condition register	Records event occurrence in the instrument. Read only.
Transition register (positive/negative)	A positive transition filter allows an event to be reported when a condition changes from false to true. A negative filter allows an event to be reported when a condition changes from true to false. Setting both positive and negative filters true allows an event to be reported anytime the condition changes. Clearing both filters disables event reporting.
Event register	Records events filtered by the transition register. Read only.
Enable register	Masks the event register to report in the summary bit. User-definable.

Status/Event reporting mechanism

Status/Event reporting mechanism (continued)



Status Byte

The Status Byte contains the following two registers

- Status Byte Register (SBR)
- Service Request Enable Register (SRER)

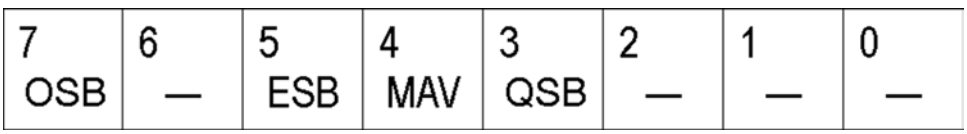
Status Byte Register (SBR)

The SBR is made up of 8 bits. Bits 4, 5 and 6 are defined in accordance with IEEE Std 488.2-1987. These bits are used to monitor the output queue, SESR and service requests, respectively. The contents of this register are returned when the *STB? query is used.

Status Byte Register (SBR)

SBR bit functions

Bit	Description
7	Operation Summary Status (OSS). Summary of the operation status register.
6	Request Service (RQS)/Master Status Summary (MSS). When the instrument is accessed using the GPIB serial poll command, this bit is called the Request Service (RQS) bit and indicates to the controller that a service request has occurred (in other words, that the GPIB bus SRQ line is LOW). The RQS bit is cleared when serial poll ends. When the instrument is accessed using the *STB? query, this bit is called the Master Status Summary (MSS) bit and indicates that the instrument has issued a service request for one or more reasons. The MSS bit is never cleared to 0 by the *STB? query.
5	Event Status Bit (ESB). This bit indicates whether or not a new event has occurred after the previous Standard Event Status Register (SESR) has been cleared or after an event readout has been performed.
4	Message Available Bit (MAV). This bit indicates that a message has been placed in the output queue and can be retrieved.
3	Questionable Summary Status (QSS). Summary of the Questionable Status Byte register.
2	Event Quantity Available (EAV). Summary of the Error Event Queue.
1-0	Not used



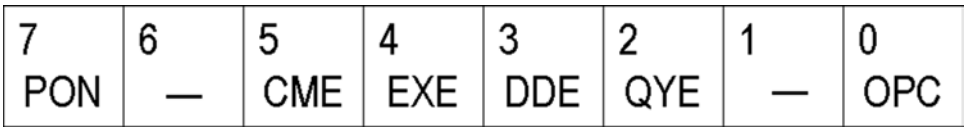
Service Request Enable Register (SRER)

The SRER is made up of bits defined exactly the same as bits 0 through 7 in the SBR as shown in the following figure. This register is used by the user to determine what events will generate service requests.

The SRER bit 6 cannot be set. Also, the RQS is not maskable.

The generation of a service request with the GPIB interface involves changing the SRQ line to LOW and making a service request to the controller. The result is that a status byte for which an RQS has been set is returned in response to serial polling by the controller.

Use the *SRE command to set the bits of the SRER. Use the *SRE? query to read the contents of the SRER. Bit 6 must normally be set to 0.



Service Request Enable Register (SRER)

Standard event status block

Reports the power on/off state, command errors, and the running state. It consists of the following registers of the following registers

- Standard Event Status Register (SESR)
- Event Status Enable Register (ESER)

These registers are made up of the same bits defined in the following figure and table. Use the *ESR? query to read the contents of the SESR. Use the *ESE() command to access the ESER.

Standard event status register

Standard event status register bit definition

Bit	Description
7	Power On (PON). Indicates that the power to the instrument is on.
6	Not used.
5	Command Error (CME). Indicates that a command error has occurred while parsing by the command parser was in progress.
4	Execution Error (EXE). Indicates that an error occurred during the execution of a command. Execution errors occur for one of the following reasons ▪ When a value designated in the argument is outside the allowable range of the instrument, or is in conflict with the capabilities of the instrument. ▪ When the command could not be executed properly because the conditions for execution differed from those essentially required.
3	Device-Dependent Error (DDE). An instrument error has been detected.
2	Query Error (QYE). Indicates that a query error has been detected by the output queue controller. Query errors occur for one of the following reasons ▪ An attempt was made to retrieve messages from the output queue, despite the fact that the output queue is empty or in pending status. ▪ The output queue messages have been cleared despite the fact that they have not been retrieved.
1	Not used.
0	Operation Complete (OPC). This bit is set with the results of the execution of the *OPC command. It indicates that all pending operations have been completed.

When an event occurs, the SESR bit corresponding to the event is set, resulting in the event being stacked in the Error/Event Queue. The SBR OAV bit is also set. If the bit corresponding to the event has also been set in the ESER, the SBR ESB bit is also set. When a message is sent to the Output Queue, the SBR MAV bit is set.

Operation status block

The operation status block contains conditions that are part of the instrument's normal operation. It consists of the following registers

- Operation Condition Register (OCR)
- Operation Positive/ Negative Transition Register (OPTR/ONTR)
- Operation Event Register (OEVR)
- Operation Enable Register (OENR)

These registers are made up of the same bits defined in the following table and figure. Use the STATus:OPERation commands to access the operation status register set.

15	14	13	12	11	10	9	8	7	6	5	4 MEAS	3	2	1	0 ALIG

Operation status register

Operation status register bit definition

Bit	Description
15	Always zero (0).
14 - 5	Not used.
4	Measuring (MEAS). Indicates that the instrument is actively measuring. When the measurement ends after this bit is set in measurement, it is reset. "In measurement" means that one of the following commands is in execution: ▪ INITiate commands ▪ READ commands
3 - 1	Not used.
0	Aligning (ALIG). Indicates that the instrument is currently performing an alignment. When the alignment ends after this bit is set in alignment, it is reset.

When the specified state changes in the OCR, its bit is set or reset. This change is filtered with a transition register, and the corresponding bit of the OEVR is set. If the bit corresponding to the event has also been set in the OENR, the SBR OSS bit is also set.

Questionable Status Block

The questionable status register set contains bits which give an indication of the quality of various aspects of the signal together with the fanned out registers as described in the next subsections. It consists of the following registers

- Questionable Condition Register (QCR)
- Questionable Positive/Negative Transition Register (QPTR/QNTR)
- Questionable Event Register (QEVR)
- Questionable Enable Register (QENR)

These registers are made up of the same bits defined in the following table and figure. Use the STATus:QUEStionable commands to access the questionable status register set.

15	14 CW	13	12	11	10	9	8 CAL	7	6	5 FREQ	4 TEMP	3 POW	2	1	0

Questionable status register

Questionable status register bit definition

Bit	Description
15	Always zero (0).
14	Command Warning (CW). Indicates a non-fatal warning that relates to the instrument's interpretation of a command, query, or one or more parameters of a specific command or query.
13 - 9	Not used.
8	CALibration Summary (CAL). Summary of the Questionable Calibration register.
7, 6	Not used.
5	FREQuency Summary (FREQ). Summary of the Questionable Frequency register.
4	TEMPerature Summary (TEMP). Summary of the Questionable Temperature register.
3	POWer Summary (POW). Summary of the Questionable Power register.
2 -0	Not used.

When the specified state changes in the QCR, its bit is set or reset. This change is filtered with a transition register, and the corresponding bit of the QEVR is set. If the bit corresponding to the event has also been set in the QENR, the SBR QSS bit is also set.

Questionable Power Register Set

Refines the power error for the POWer bit in the QCR.

Currently not used

Questionable Temperature Register Set

Refines the temperature error for the TEMPerature bit in the QCR.

Currently not used.

Questionable Frequency Register Set

The questionable frequency register set is made up of bits defined in the following table and figure. It refines the frequency error for the FREQuency bit in the QCR.

Use the STATus:QUEStionable:FREQuency commands to access the questionable frequency register set.

15	14	13	12	11	10 ERNV	9 LTER	8	7	6	5	4	3	2	1	0

Questionable frequency status register

Questionable frequency status register bit definition

Bit	Description
15	Always zero (0).

Bit	Description
14 - 11	Not used.
10	External Ref Not Valid (ERNV). Indicates that the external reference signal is not valid so the instrument is no longer locked to it.
9	Locked To External Ref (LTEF). Indicates that the instrument is locked to the external reference signal.
8 - 0	Not used.

Questionable Calibration Register Set

The questionable calibration register set is made up of bits defined in the following table and figure. It refines the calibration error for the CALibration bit in the QCR. Use the STATus:QUEStionable:CALibration commands to access the questionable calibration register set.

Questionable calibration status register

Questionable calibration status register bit definition

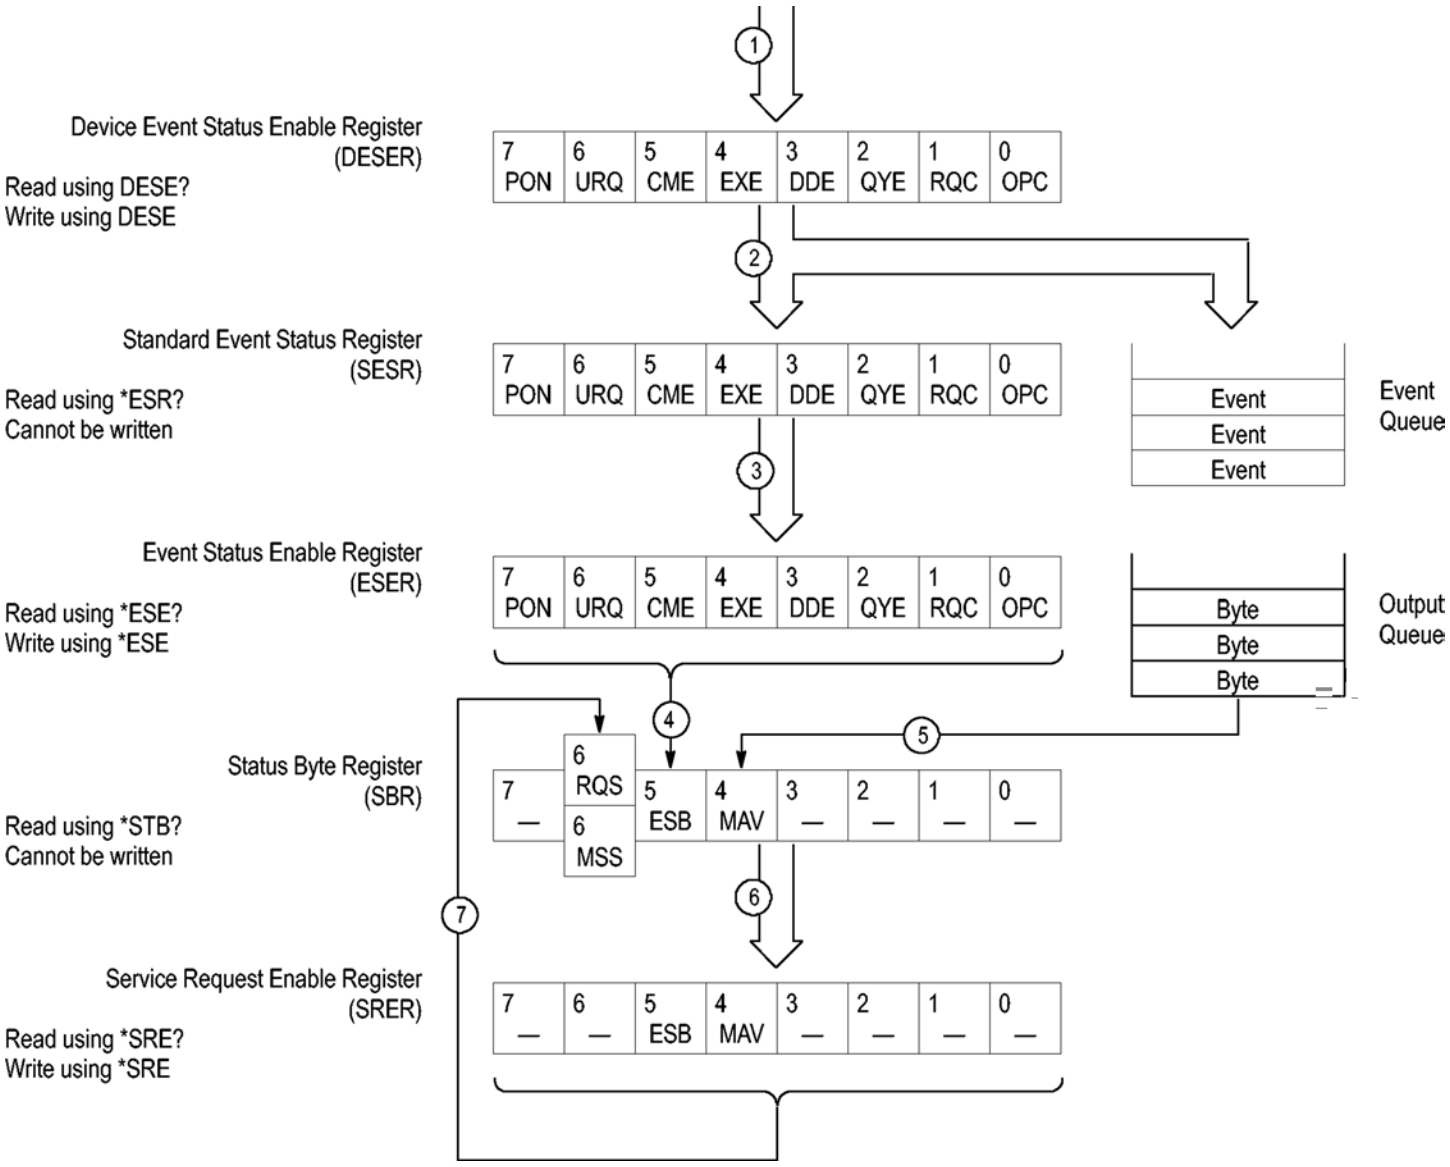
Bit	Description
15	Always zero.
14	Alignment Needed (ALN). Indicates the instrument needs the alignment.
13 - 0	Not used.

Queues

There are two types of queues in the status reporting system used in the analyzer: output queues and event queues.

Output Queue

The output queue is a FIFO (first in, first out) queue and holds response messages to queries, where they await retrieval. When there are messages in the queue, the SBR MAV bit is set.



The output queue will be emptied each time a command or query is received, so the controller must read the output queue before the next command or query is issued. If this is not done, an error will occur and the output queue will be emptied; however, the operation will proceed even if an error occurs.

Event Queue

The event queue is a FIFO queue and stores events as they occur in the analyzer. If more than 32 events occur, event 32 will be replaced with event code -350 ("Queue Overflow"). The error code and text are retrieved using the SYSTem:ERRor queries.

Status and event processing sequence

The following figure shows an outline of the sequence for status and event processing.

Status and event processing sequence

1. If an event has occurred, the SESR bit corresponding to that event is set and the event is placed in the event queue.
2. A bit corresponding to that event in the ESER has is set.
3. The SBR ESB bit is set to reflect the status of the ESER.
4. When a message is sent to the output queue, the SBR MAV bit is set.
5. Setting either the ESB or MAV bits in the SBR sets the respective bit in the SRER.
6. When the SRER bit is set, the SBR MSS bit is set and a service request is generated when using the GPIB interface.

Synchronizing execution

Almost all commands are executed in the order in which they are sent from the controller, and the execution of each command is completed in a short period of time. However, the following commands perform data analysis in another thread, and another command can thus be executed concurrently

- `INITiate` commands
- `READ` commands
- `[SENSe]:REANalyze`

These commands are designed so that the next command to be sent is executed without waiting for the previous command to be completed. In some cases, a process executed by another command must first be completed before these commands can be executed; in other cases, these commands must be completed before the next command is executed.

You have two options to achieve command synchronization

- Using the status and event reporting function
- Using synchronizing commands

Using the Status and Event Reporting Function

In the following example, a READ command is used to obtain the measurement results while the Operation Condition Register (OCR) is being used to provide synchronization.

```
STATus:OPERation:NTRansition 16
// Set the filter of the OCR MEASuring bit
STATus:OPERation:ENABle 16
// Enable the filter of the OCR MEASuring bit
*SRE 128
// Set the SRER OSS bit
READ:SPECtrum:TRACe
// Obtain the measurement results
```

The command waits for generation of SRQ.

Using Synchronizing Commands

The IEEE-488.2 common commands include the following synchronizing commands

- *OPC
- *OPC?
- *WAI

Using the *OPC command. The *OPC command sets the SESR OPC bit when all the operations for which it is waiting are completed. If the GPIB interface is in use, you can synchronize the execution by using this command together with the serial polling or service request function.

The following is a command sequence example:

```
*ESE 1
// Enable the ESER OPC bit
*SRE 32
// Enable the SRER ESB bit
ABORt;INITiate:IMMediate;*OPC
// Wait for SRQ to provide synchronization
```

Using the *OPC? query. The query *OPC? writes ASCII code "1" into the Output Queue when all operations for which it is waiting are completed. You can provide synchronization using the command string as the following example:

```
ABORt;INITiate:IMMediate;*OPC
```

The command waits until "1" is written into the Output Queue. When the command goes to the Output Queue to read the data, a time-out may occur before the data is written into the queue.

Using the *WAI Command. After the process of the preceding command is completed, the *WAI command begins to execute the process of the next command as the following example:

```
ABORt;INITiate:IMMediate;*WAI
// Wait for the *WAI process to provide synchronization
```

Error messages and codes

Error codes with a negative value are SCPI standard error codes; errors with a positive value are unique to the RSA Series Signal Analyzers.

Event codes and messages can be obtained by using the queries `SYSTem:ERRor?` and `SYSTem:ERRor:ALL?` These are returned in the following format

```
<event_code>,"<event_message>"
```

Command errors

Command errors are returned when there is a syntax error in the command.

Command errors

Error code	Error message
-100	Command error
-101	Invalid character
-102	Syntax error
-103	Invalid separator
-104	Data type error
-105	GET not allowed
107	Can't replay - settings not compatible with data record
-109	Missing parameter
-111	Header separator error
-112	Program mnemonic too long
-113	Undefined header
-114	Header suffix out of range
-120	Numeric data error
-121	Character
-123	Exponent too large
-124	Too many digits
-128	Numeric data not allowed
-130	Suffix error

Error code	Error message
-131	Invalid suffix
-134	Suffix too long
-138	Suffix not allowed
-140	Character data error
-141	Invalid character data
-144	Character data too long
-148	Character data not allowed
-150	String data error
-151	Invalid string data
-158	String data not allowed
-160	Block data error
-161	Invalid block data
-168	Block data not allowed
-170	Command expression error
-171	Invalid expression
-178	Expression data not allowed
-180	Macro error
-181	Invalid outside macro definition
-183	Invalid inside macro definition
-184	Macro parameter error

Execution errors

These error codes are returned when an error is detected while a command is being executed.

Execution errors

Error code	Error message
-200	Execution error

Error code	Error message
-201	Invalid while in local
-202	Settings lost due to RTL
-210	Trigger error
-211	Trigger ignored
-212	Arm ignored
-213	Init ignored
-214	Trigger deadlock
-215	Arm deadlock
-220	Parameter error
-221	Settings conflict
-222	Data out of range
-223	Too much data
-224	Illegal parameter value
-225	Out of memory
-226	Lists not same length
-230	Data corrupt or stale
-231	Data questionable
-240	Hardware error
-241	Hardware missing
-250	Mass storage error
-251	Missing mass storage
-252	Missing media
-253	Corrupt media
-254	Media full
-255	Directory full

Error code	Error message
-256	Filename not found
-257	Filename error
-258	Media protected
-260	Execution expression error
-261	Math error in expression
-270	Execution macro error
-271	Macro syntax error
-272	Macro execution error
-273	Illegal macro label
-274	Execution macro parameter error
-275	Macro definition too long
-276	Macro recursion error
-277	Macro redefinition not allowed
-278	Macro header not found
-280	Program error
-281	Cannot create program
-282	Illegal program name
-283	Illegal variable name
-284	Program currently running
-285	Program syntax error
-286	Program runtime error

Device specific errors

These error codes are returned when an internal instrument error is detected. This type of error may indicate a hardware problem.

Device specific errors

Error code	Error message
-300	Device specific error
-310	System error
-311	Memory error
-312	PUD memory lost
-313	Calibration memory lost
-314	Save/Recall memory lost
-315	Configuration memory lost
-330	Self test failed
-350	Queue overflow

Query Errors

These error codes are returned in response to an unanswered query.

Query errors

Error code	Error message
-400	Query error
-410	Query interrupted
-420	Query unterminated
-430	Query deadlocked
-440	Query unterminated after indefinite period

Device errors

These error codes are unique to the RSA Series. They are classified into three groups: global, measurement, and source conditions, as shown in the following tables.

Device errors, global condition

Error code	Error message
100	Setup error
101	Disabled: data is from swept acquisition
102	Disabled: swept settings; Acquire data while display is selected

Error code	Error message
103	Acquisition bandwidth too small for current setup
104	Can't get acquisition data record
105	Can't open the requested display
106	Analysis failure
107	Analysis length was limited
108	Analysis length too small for current setup
109	No math trace: unmatched trace lengths
110	Analysis time was adjusted
111	Not enough samples for current setup
112	Can't replay. Data is from swept acquisition.
113	Can't replay. Live data needed for swept settings.
114	Recall error: setup not completely restored
115	Recall failure: problem with file or file contents
116	Save failure: file not saved
117	Unexpected software error. Please cycle power and try again.
118	Export failure: file not saved
119	Export failure: unable to open results file for export. File not saved.
120	Search condition for this result is already defined.
121	Search condition for this result was not found.
124	Load failed: <filename>
125	Store error: file not saved.
126	No Math trace: unmatched trace X range
127	Not enough memory for measurement
128	Incomplete analysis
129	Not enough samples for current setup

Error code	Error message
130	Mask creation error: <reason message>

Device errors, measurement condition

Error code	Error message
1000	TDBW actual (TDBW: Time Domain Bandwidth)
1002	RBW increased to
1003	RBW limited by acquisition bandwidth to
1004	RBW conflict. Increase span or analysis length
1011	Audio disabled: configuration problem
1012	Audio Demod disabled: swept acquisition
1013	Audio Demod disabled: trigger in use
1014	Audio disabled: IF band outside Acq BW
1015	Calibration error. See Windows Event Viewer for error detail.
OBW errors	
1016	Analysis failure: AcqBW < MeasBW + (5 x RBW)
1017	Analysis failure: AcqBW must be 10 kHz or more
1018	x dB BW > Meas BW
Pulse errors	
1019	AcqBW too low for current Chirp BW setting
1020	Impulse Response only valid for Chirp modulation
1023	Not enough memory for measurement
Other measurements	
1024	BW actual (limited by Acq BW)
1025	CISPR not available in FastFrame. Uncheck FastFrame in the Acquire panel.
1026	Analysis length must be in auto.
1027	Carrier not found

Error code	Error message
1029	CISPR accuracy limited by acq memory. Adjust RBW or freq range.
1030	CISPR: Acq BW too small for RBW. Try increasing span or freq range.
1031	Insufficient data for CISPR. Acquire while display is selected.
1032	VBW increased - Analysis Length too short
1033	VBW does not use full Analysis Length.
1034	Analysis time was adjusted\nReached sample limit of

Device errors, source condition

Error code	Error message
2008	Not calibrated
2009	FMT RBW limited by Acq BW to <XX>
2010	FMT RBW increased by Acq BW to <XX>
2011	Hardware failure - see Windows Event Viewer
2012	FMT disabled: Acq BW too small for current setup
2013	Hardware failure detected by diagnostics
2014	FMT disabled: RefLev too low for Volts/Watts units
2015	FMT disabled: settings conflict with selected measurement
2016	Preamp freq range exceeded
2024	RBW limited by Span to <XX>
2025	RBW increased by Span to <XX>
2028	External frequency reference signal not valid. Using internal reference.
2029	Unable to lock to external frequency reference. Using internal reference.
2033	Alignment error. Please run alignment again. If the problem persists, contact your Tektronix Service Center.
2034	Operational error: unable to complete operation. Please try again. If the problem persists, contact your Tektronix Service Center. See Windows Event Viewer for error detail.
2035	Hardware error: unable to configure hardware. Please try again. If the problem persists, contact your Tektronix Service Center. See Windows Event Viewer for error detail.

Error code	Error message
2036	Shutting down - internal temperature is too high. Check fans and airflow. If the problem persists, contact your Tektronix Service Center.
2037	Hardware error detected. To clear error, exit and restart the application. If the problem persists, contact your Tektronix Service Center.
2038	Disabled: RefLev too low\nfor Volts/Watts units
2042	Ext Corr > 20 dB pk-pk in acq segment
2044	Combined External Correction tables exceed the 60 dB peak-to-peak limit. External Correction tables were disabled. Please check table values and try again.
2045	Disabled: FastFrame doesn't support swept settings.
2046	Attenuator use currently exceeds the cautionary limit of 1200 changes per hour. Operation was stopped to protect against premature wear-out. The monitor function can be temporarily disabled in the Amplitude control panel or over the programmatic interface. Specified lifetime for an attenuator is 10,000,000 changes.
2047	Disabled: settings conflict with selected measurement
2048	Done saving — restart with Stop, then Run. The maximum number of files saved per run have been saved. To restart another FastSave acquisition, send INITIATE.

Status Conditions

Status conditions do not appear in the event queue, they are only returned by a `:STATus:<measurement>EVENts?` query.

Global status

Global status conditions can be returned with any `:STATus:<measurement>EVENts?` query.

Global status conditions

Status code	Status message
10107	Analysis Length was limited
10108	Analysis length too small for current setup
10110	Analysis time was adjusted
10122	Search result not enabled
10123	Search result no longer available

Measurement status

Measurement status conditions are unique to specific measurement groups.

Measurement status conditions

Status code	Status message
Pulse Measurements	
11001	Avg Tx only available in power units
11005	Pulse detection error
11006	Setup error: Define > Measurement Point is too late
11007	No pulses found
11008	No FFT (not all pulses have results)
11020	No FFT (not enough pulses)
11022	Analysis time was adjusted - reached time limit
11039	No sidelobe found
GP Digital Modulation	
11009	No burst detected
11034	Display not valid for selected modulation type
11035	Samples per symbol > 200. Decrease Measurement BW
11036	Too many samples per symbol. Decrease Measurement BW
Chan Power and ACPR	
11010	Measuring Noise
Other	
11028	CISPR: (progress message)
11037	Ext corrections enabled for traces
Settling Time	
11041	Signal not settled
11042	Settled duration too short
11043	First transition not found
11044	Meas Length limited by Analysis Length to xx.x xs

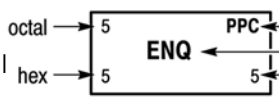
Status code	Status message
11045	Not enough samples: increase Meas BW or Meas Length
11046	Measurement Length exceeds limit of xxM points

Source status

Source status conditions can be returned with any `:STATus:<measurement>EVENts?` query.

Source status conditions

Status code	Status message
12000	Data acquired during RF ADC overrange
12005	Aligning
12006	Not aligned
12007	Unaligned data
12009	Data from uncalibrated instrument
12010	Dither: manual control
12012	Data acquired during hardware failure
12014	Data acquired during RF dig gain overflow
12015	Locking to ext freq ref signal...
12018	RF Attenuator: manual control
12019	Saving acquisition
12020	Recalling acquisition data
12022	Disabled: data is from swept acquisition
12023	Disabled: Freq Mask Trigger in use
12026	Acq Sampling params: manual control
12027	Swept: RF Trig invalid for most signals
12030	Data acquired during RF ADC overrange
12031	Data acquired during RF dig gain overflow
12039	Decrease RefLev or increase\nAtten to prevent data errors



Status code	Status message
12040	Possible data errors - acquired with RefLev too much higher than RFAtten
12043	Ext Corr error - tables not applied
12056	Warming up
12057	Data acquired during warm-up
12063	Triggers disabled when DPX is swept
12064	Waiting for trigger. Open the DPX display.
12066	Data exceeds preamp range

Appendix C: Creating a DPX Frame Access Plugin

A DPX Frame Access plugin gives access to DPX frames (bitmap and traces) from within the RSA process. The frame is accessed directly from its storage in memory, and so this method provides faster access to this data than from the **ASCII** (GPIB) interface.

A DPX Frame Access plugin consists of a managed assembly (dll) that contains a class that implements the IDPXFrameAccess interface. See below:

```
/// <summary>
/// If an external assembly is found that contains a type
/// that implements this interface, then it will be given
/// access to DPX frame data synchronous with data
/// coming from the hardware.
/// <summary>
public interface IDPXFrameAccess : IDisposable
{
/// <summary>
/// A frame is available. It will get called for
/// every stitch.
```

```
/// <summary>
/// <param name="frame">valid only during the duration
/// of the function call </param>
void FrameAvailable(IDPXFrame frame);
}
```

The object that is passed into the FrameAvailable function is accessed via its IDPXFrame interface. See below:

```
/// <summary>
/// A DPX frame
///
/// <summary> public interface IDPXFrame
{
/// <summary>
/// Start frequency for traces and bitmap, Hz
/// <summary> double StartFrequency { get; }
/// <summary>
/// Stop frequency for traces and bitmap, Hz
/// </summary>
double StopFrequency { get; }
/// <summary>
/// Top value of graph - current units
/// </summary>
double TopOfGraph { get; }
/// <summary>
/// Bottom value of graph - current units
/// </summary>
double BottomOfGraph { get; }
/// <summary>
/// What type of frame?
/// </summary>
DPXFrameType FrameType { get; }
/// <summary>
/// This is true if the frame is completed.
/// It will be false if swept, and not all
/// of the intermediate stitches have been
/// completed. It will be true when all stitches
/// have been completed, or if real-time.
/// </summary>
bool FrameComplete { get; }
/// <summary>
/// Get dimensions for bitmap
/// </summary>
/// <param name="rowCount"></param>
/// <param name="columnCount"></param>
void GetDimensions(out int rowCount, out int
columnCount);
/// <summary>
/// <param name="x"></param>
void GetReferenceToBitmap(out ushort[] x);
/// <summary>
/// Get reference to array holding bitmap.
/// Do not change the values in this array
/// </summary>
/// <param name="x"></param>
void GetReferenceToBitmap(out float[] x);
/// <summary>
```

```
/// Get copy of Trace1. This will be the Max trace
/// </summary>
/// <param name="yValues">function will allocate
/// the array, as necessary</param>
void GetTrace1(ref float[] yValues);
/// <summary>
/// Get copy of Trace2. This will be the Min trace
/// </summary>
/// <param name="yValues">function will allocate
/// the array, as necessary</param>
void GetTrace2(ref float[] yValues);
/// <summary>
/// Get copy of Trace3. This will be the Avg trace
/// </summary>
/// <param name="yValues">function will allocate
/// the array, as necessary</param>
void GetTrace3(ref float[] yValues);
}
public enum DPXFrameType
{
/// <summary>
Standard,
/// </summary> Enhanced,
}
```

When the DPX measurement is running within the RSA application, the IDPXFrameAccess.FrameAvailable function is called once for every frame that becomes available from the DPX processing hardware. When the DPX measurement is operating in Real Time mode, FrameAvailable will be called for every Real Time frame. When the DPX measurement is operating in Swept mode, the total frequency span is covered by stitching together multiple real time spans at increasing center frequencies. In this case, FrameAvailable will be called for every stitch, with IDPXFrame.FrameComplete set to true on the last stitch.

The DPXFrameAccess assembly should not use the reference to the IDPXFrame object outside of the FrameAvailable function. It is only valid within the context of the FrameAvailable function call.

The creator of a DPXFrameAccess plugin should refer to the information in this programmer manual about the format of bitmap and trace data returned in the IDPXFrame object. Specifically, the FETCh:DPX:TRACe:xxx? queries are applicable. Traces that are not enabled are not computed and will not be available in the IDPXFrame.

Cautions about processing time within FrameAvailable function – in Real Time mode, DPX frames become available at a constant rate. As more time is taken in the FrameAvailable function, less CPU time is available for processing RF acquisitions (all the other measurements). If too much time is taken in the FrameAvailable function, frames may be missed and the update rate of other measurements may significantly slow down as they operate at lower priority than the DPX measurement.

To create a DPX Frame Access plugin, start with the example file attached to the PDF version of this manual. It has a class that implements IDPXFrameAccess and gives examples of accessing the various properties and methods of IDPXFrame.

NOTE: An example text file, DPXFrameAccessExample.cs, is attached to this PDF file. To access the attached file, open the PDF file and click the paperclip icon on the lower-left side of the document viewer.

Note that the build of this assembly will need to reference the MeasurementsShared.dll assembly in the C:\Program Files\Tektronix\XXXX\RSA\Client directory, where XXXX is either RSA5100B, or SignalVu, depending on the product..

Copy the DPX Frame Access assembly you have created to the C:\Program Files\Tektronix\XXXX\RSA\Plugins\DPX directory (you will need to create the directory). When the DPX measurement is started, it will discover the assembly and the FrameAvailable function will be called.

Glossary

Acronym	Description
ASCII	Acronym for the American Standard Code for Information Interchange. Controllers transmit commands to the instrument using ASCII character encoding.
ASK	Acronym for Amplitude Shift Keying. The process, or result of a process, in which the amplitude of the carrier is varied in accordance with the state of a digital input signal.
BNF (Backus-Naur Form)	A standard notation system for command syntax diagrams. The syntax diagrams in this manual use BNF notation.
Controller	A computer or other device that sends commands to and accepts responses from the analyzer.
EVM (Error Vector Magnitude)	The magnitude of an error of an actual signal relative to an ideal signal in a constellation display.
GPIB	Acronym for General Purpose Interface Bus, the common name for the communications interface system defined in IEEE Std 488.
IEEE	Acronym for the Institute for Electrical and Electronics Engineers.
IS95	Acronym for Interim Standard-95. The standards name for first-generation CDMA cellphone technology.
Modulation	The process of varying some characteristic of a signal with a second signal.
PSK	Acronym for Phase Shift Keying. The process, or result of a process, in which the carrier phase is varied discretely in accordance with a digital code.
QAM	Acronym for Quadrature Amplitude Modulation. The process, or result of a process, in which the amplitude and phase of the carrier are varied concurrently by synthesizing two orthogonal ASK waves (see ASK).
